PRAYER, BOOK OF COMMON, the title of the official service
book of the Church of England. One of the most important
steps taken at the Reformation was the compilation and provi-
sion of a comprehensive service book for general and compulsory
use in public worship in all cathedral and parish churches
throughout the Church of England.

Apart from alterations in detail, both as to doctrine and ritual,
which will be referred to later, the following main advantages
were achieved from the very first and apply to all editions of
the Prayer Book equally.

1. The substitution of the English language for the Latin
language, which had hitherto been in universal and almost
complete use, and in which all the old service books were
written.

2. The reformed Latin liturgy. Although many Latin
authors, and especially Gemma of Ravenna, had written
useful editions and translations and some authors, like
Cranmer's preface "Concerning the Service of the Church,
expressly mentions the abolition of any one thing
as the things to be achieved by a Book of Common Prayer.
It says: "And whereas heretofore there have been great diversity in
saying and singing in Churches within this Realm; some following
Salisbury Use, some Hereford Use, and some the Use of Bangor,
some of York, some of Lincoln; now from henceforth all the
whole Realm shall have but one Use."

We will next enumerate the sources from which the Prayer
Book was compiled. 1. It has been already indicated that the older
pre-Reformation service books formed the main quarry, especially
the Sarum Use, to which the Breviary and Sarum form of Prayer,
including the psalter and the lessons, were taken from the
Breviary, Matins being compiled out of Nocturns (or Matins), Lauds
and Prime; and Evensong out of Vespers and Compline. The Order
of Communion, compiled in 1549, and the Collects, Epistles and
Gospels, was taken from the Missal. The sacramental and other
orders which occupy a position in the Prayer Book between the Order
of Holy Communion and the Psalms were taken from the Manual;
and the services for confirmation or ordaining of bishops and
deacons were taken from the Pontifical; but in all cases not only
with a change of Latin into English, but with numerous alterations,
omissions and additions.

3. The examination and compilation of earlier Book of
Common Prayer, the Breviary of Cardinal Quignon, Francis
de Quignon, a Spanish, a Franciscan and cardinal of the Holy
Cross, brought out a reformed Latin breviary with papal sanction
in 1535. A second and revised edition appeared in 1537. It met
with considerable favour, and was adopted into use in many places
without, however, winning universal acceptance, and in 1539 papal
sanction was withdrawn and it ceased to be printed. From this reformed breviary the compilers of the Prayer Book borrowed the following. (a) Many passages—almost verbatim—in the preface “Concerning the Service of the Church.” It would occupy too much space to list them all, but the following are of particular interest: in particular, the introduction of the Sunday and Holy-Day services is identical in structure with the week-day services. (c) The removal of all antiphons and responses. This refers to Quiggin’s first edition only. (d) The increased amount of the Litany. He added, not only the new text, but also the Litany from the Old Testament; a second lesson from the New Testament; and on Saints’ Days a third lesson from the Lives of the Saints, though this lesson was also occasionally taken from Holy Scripture. (e) The preface to every service a form of confession and absolution. The idea, not the actual language of the form, was added to the text of the various Breviaries. (f) The substitution of the Athanasian Creed for the Apostles’ Creed on certain days instead of being an addition to the latter. So in the Prayer Book, when used, the Athanasian Creed is introduced, but not added to the short recitation of the same prayers with slight variations, was first published by Cardinal Thomasius in 1680 and must have been unknown to Cranmer. (g) According to F. Procter and W. H. Frere (A New History of English Liturgy, p. 285) the Athanasian Creed was published in 1549, but for the reference of the prayer for the consecration of the water in the office for the public baptism of infants are adapted from the benediction of the font in the Mozarabic Liturgy (Migne, Pat. Lat. tom. lxxxvi. col. 465). The discovery of such a text is interesting in connexion with the prayer for this purpose provided in the first book of Edward VI. The Mozarabic Liturgy was printed and published under Cardinal Ximenes in 1500, and may well have been in Cranmer’s hands; which similarly, it is no harm to add, is no less likely to have been added to the uniform assignment of three Psalms to each hour suggests the average number and arrangement of the Psalms in the Prayer Book at Matins and Evensong.

This is not an exact translation of any known epistles, and Cranmer altered its position from after to immediately before the words of institution. (d) Four petitions in the Litany. “That it may please Thee to illuminate all Bishops, Priests and Deacons,” &c. (altered in 1662 to “To humble all bishops and ministers”) and “That it may please Thee to give to all nations unity, peace and concord,” and “That it may please Thee to succour, help and comfort all that are in danger, necessity and tribulation,” and “That it may please Thee to give bread of the earth and the fruit of water. (e) The Grafting of the Psalms on the Epistles in the Mozarabic Liturgy (St Chrysostom, ed. F. E. Brightman, p. lv., and a far more closely the Greek petition than they do any corresponding Latin petitions in the Old Sarum Litany.

5. Lutheran and other continental Protestant service books. Among the most considerable quantity of the new material which was imported into the Prayer Book was drawn from Lutheran and Genevan service books. The Litany, for example, in the Prayer Book is based upon the medieval Latin Litany, but great variations both in substance and language and by way of addition and omission, are made in it. These variations are largely borrowed from and closely follow the language of various Lutheran litanies, especially those given in the consultation of Archbishop Hermann of Cologne issued in 1543. Lutheran influence can likewise be traced in the way of variation introduced into the baptismal and other sacramental or occasional offices. So in the Communion service the most striking departures from ancient precedent have a Protestant origin. The Cranmerian service was based upon a prayer in the Liturgy of St Chrysostom, but the form of this was to be derived from the order of service published by Valeranum Pollanus (Pullain) in 1551; and that of the Comfortable Words in 1549 is borrowed, though all the texts chosen are not identical, from that of Gunning, Archbishop of Canterbury.

6. Original compositions of the compilers of the Prayer Book, not traceable to ancient or 16th-century originals. These are not numerous. They are: (a) The prayer for the anointing of infants which, though no direct evidence of authorship is as yet forthcoming, Cranmer is probably responsible, and certain other collects, such as that for the Royal Family (Archbishop Whiglit); (b) for the high day of parliament (Archbishop Laud); that for all conditions of men (ed. Gunning), &c.

We proceed to describe next the various stages through which the Book of Common Prayer has passed and the leading features of each revision. Of changes preceding the first Prayer Book it will only be necessary to mention here: (a) The compiling and publishing of the Litany in English by Cranmer in 1544. (b) Royal injunctions in August 1547 ordering the Epistle and Gospel to be read in English at High Mass. (c) A royal proclamation, 13 November 1547, ordering the use of the Book. (d) Finally, the Easter The Order of the Communion. This was an order or form of service in English for the communion of the people in both kinds. It was to be inserted into the service after the communion of the priest, without making any other alteration in the Latin Mass. It comprised the long exhortation or notice to be given on Sunday, or on some other day, previous to the Communion, the longer exhortation, and the shorter invitation, the confession, absolution, comfortable words, prayer of humble access, formulae of administration and the concluding peace, all as they exist at present, though with variations of some importance.

The first complete vernacular Book of Common Prayer was issued in 1549. It was carried through both houses of parliament by the 21st of January 1549, by an Act of Uniformity which made its use compulsory on and after the following Whit-Sunday. The exact date of the giving of the royal assent, and the question whether this Book received the assent of Convocation, is an obscure point of much difficulty and uncertainty which cannot be treated at length here.

Some of the chief points of difference between this and subsequent Prayer Books were the following: Matins and Evensong began with the Lord’s Prayer, and ended with the third collect; there were no alternative Psalm-canticles for Benedictus, Magnificat and Nunc Dimittis; the Athanasian Creed was introduced after the Benedictus on six festivals only, and in addition to the Apostles’ Creed; the Litany was placed after the Communion service, for which an alternative title was given; viz. “commonly called the Mass.” Introductions were provided for use on every Sunday and Holy-Day; after the offerio
intending communicants were directed to “tarry still in the quire or in some convenient place nigh the quire”; in the prayer “for the whole state of Christ’s church,” the blessed Virgin Mary was commemorated by name among departed saints; prayer for the departed was explicitly retained; also an invocation of the Holy Spirit before the words of institution, the prayer of oblation immediately following them. The mixed chalice was ordered to be used, and the Agnus Dei to be sung during the Communion of the people. A large selection of short scriptural post-Communions was provided. Unleavened bread was to be used and placed not in the hand but in the mouth of the communicant. The sign of the cross was to be made not only in the eucharistic consecration prayer, but also in Baptism, Confirmation, Holy Matrimony and the Visitation of the Sick. Reservation for the sick and unction of the sick were retained; and exorcism, unction, trine immersion and the chrisom were included in the baptismal service. The prayer in the burial service, as in the Communion service, contained distinct intercessions for the departed; and a form of Holy Communion was provided for use at funerals with proper introit, collect, epistle and gospel.

As to vestments, in the choir offices, the surplice only was to be used; the hood being added in cathedrals and colleges; and by all graduates when preaching, everywhere.

At Holy Communion the officiating priest was to wear “a white Albe plain with a vestment or Cope,” and the assistant clergy were to wear “Albes with tunicles.” Whenever a bishop was celebrating he was to wear, “beside his rochet, a surplice or albe, and a cope or vestment,” and also to carry “his pastoral staff in his hand, or else borne or holden by his chaplain.” The mitre was not mentioned.

The ordinal was not attached to this Prayer Book at its first appearance, but it was added under another act of parliament in the following year, 1550. It was very similar to the present ordinal except that the words for the office and work of a Priest and Bishop of the Church of God, now committed unto thee by the Imposition of our hands” were wanting, and the chalice or cup with the bread were delivered, as well as a Bible, to each newly-ordained priest.

We pass on to 1552 when a new and revised edition of the Prayer Book was introduced by an act of parliament which ordered that it should come into use on All Saints’ Day (Nov. 1). The alterations made in it were many and important, and as they represent the furthest point ever reached by the Prayer Book in a Protestant direction, they deserve special mention and attention.

1. The introductory sentences, exhortation, confession and absolution were prefixed to the Order for Morning Prayer daily throughout the year and ordered to be read before Evening Prayer as well. Alternative Psalms were provided for Benedictus, Magnificat and Nunc Dimitis.

2. Numerous and most important alterations were made in the Order for Holy Communion, in the title of which the words “commonly called the Mass” were left out. (a) The Introits were omitted. (b) Gloria in excelsis was transferred from near the beginning to near the end of the service. (c) The ten commandments with an expanded tenfold Kyrie eleison were introduced. (d) The long new English canon of 1540 was split up into three parts: the first part becoming the prayer for the church militant; the second part becoming the prayer of consecration, the third part, or prayer of oblation, becoming the first post-Communion collect; the epiklesis or invocation of the Holy Ghost upon the elements was entirely omitted. (e) The mixed chalice, the use of the sign of the cross in the consecration prayer; the commemoration of the blessed Virgin Mary and of various classes of saints were omitted. (f) The Agnus Dei and the post-Communion anthems were omitted. (g) The words of administration in the 1549 book were abolished, viz.: “The body of our Lord Jesus Christ which was given for thee, preserve thy body and soul unto everlasting life,” and “The blood of our Lord Jesus Christ which was shed for thee preserve thy body and soul unto everlasting life,” and the following words were substituted: “Take and eat this in remembrance that Christ died for thee, and feed on him in thy heart by faith, with thanksgiving,” and “Drink this in remembrance that Christ’s blood was shed for thee, and be thankful.” (i) A long rubric was added at the end of the service explanatory of the attitude of kneeling at the reception of Holy Communion, in which it was stated that “it is not meant hereby that any adoration is done, or ought to be done, either unto the sacramental bread and wine there bodily received, or to any real and essential presence there being of Christ’s natural flesh and blood,” etc. (i) Exorcism, unction, trine immersion and the chrisom were omitted from the baptismal service. (j) UNCTION and communion with the reserved sacrament were removed from the services for the visitation and the communion of the sick. (k) Prayers for the dead and provision for celebration of Holy Communion at a funeral were removed from the burial service. (m) The vestments retained and ordered under the Prayer Book of 1549 were abolished by a new rubric which directed that both at the time of Communion and at all other times of ministration a bishop should wear a rochet and that a priest or deacon should have and wear a surplice only; (n) on the other hand, the directions as to daily service were extended to all clergy and made much stricter, (o) and the number of days on which the Athanasian Creed was to be used was raised from six to thirteen.

The main objects of these drastic alterations have been thought to have been two-fold.

1. To abolish all ritual for which there was not scriptural warrant. If this was their object it was not consistently or completely carried out. No scriptural warrant can be found for the use of the surplice, or for the use of the sign of the cross in baptism, both of which were retained.

2. To make the services as unlike the pre-Reformation services as possible. This object too was not fully attained; no liturgical precedent can be found for the violent dislocation of certain parts of the Order for Holy Communion, especially in the case of the prayer of oblation and of the Gloria in Excelsis; but the orders for Morning and Evening Prayer and the Holy Communion retained features of the Breviary and Missal services, the bulk of their component material being still drawn from them. While the alterations, therefore, were violent enough to alarm and offend the Catholic party, they were not violent enough to satisfy the extreme Puritan party, who would no doubt have agitated for and would probably have obtained still further reformation and revision. But this Prayer Book only lived for eight months. It came into use on All Saints’ Day (Nov. 1) 1552, and on the 6th of July 1553 Edward VI. died and was succeeded by his sister Mary, under whom the Prayer Book was abolished and the Old Latin services and service books resumed their place.

On the death of Queen Mary and the accession of her sister Elizabeth (Nov. 17, 1558) all was reversed, and the Book of Common Prayer was restored into use again.

The Act of Uniformity, which obtained final parliamentary authority on the 28th of April 1559, ordered that the Prayer Book should come again into use on St John the Baptist’s Day (June 24, 1559). This was the second Prayer Book of King Edward VI., with the following few but important alterations, which, like all the alterations introduced at subsequent dates into the Prayer Book, were in a Catholic rather than in a Protestant direction.

1. Morning and Evening Prayer were directed to be “used in the accustomed place of the church, chapel or chanter, instead of “in such place as the people may best hear.”

2. The rubric ordering the use of the rochet only by the bishop and of surplice only by a priest or deacon was abolished. The eucharistic vestments ordered in the first Prayer Book of Edward VI. were brought back by a new rubric which directed that “the minister at the time of the communion and at all other times in his ministration, shall use such vestments in the church as were in use by authority of parliament in the second year of the reign of King Edward the VI. according to the act of parliament set in the beginning of this book.

3. In the Litany the following petition found in both the
Edwardian Prayer Books was omitted “from the tyranny of the bishop of Rome and all his detestable enormities, good Lord deliver us.”

4. In the Communion service the two clauses of administration found in the first and second Prayer Books of King Edward’s reign were combined.

5. The rubric explanatory of “kneeling for reception,” commonly known as “the Black Rubric” was omitted.

6. In the Ordinal in the rubric before the oath of the queen’s sovereignty the words “against the power and authority of all foreign potentates” were substituted for “against the usurped power and authority of the Bishop of Rome,” and in the oath itself four references to the bishop of Rome, by name, were omitted.

There were a few more minor alterations, without doctrinal or political significance which need not be described in detail here.

The only further addition or alteration made in Queen Elizabeth’s reign was in 1561, when all the present black letter Holy Days were added to the Kalendar except St George (April 23) Lammas (Aug. 1), St Laurence (Aug. 10) and St Clement (Nov. 22), which already existed, and except St Enuruchus (Sept. 7), added in 1604, and the Venerable Bede (May 27) and St Alban (June 17) added in 1662.

A smouldering and growing Puritan discontent with the Prayer Book, suppressed with a firm hand under Queen Elizabeth, burst out into a flame on the accession of King James I. in 1603. A petition called the millenary petition, because signed by no less than one thousand ministers, was soon presented to him, asking, among other things, for various alterations in the Prayer Book and specifying the alterations desired. As a result the king summoned a conference of leading Puritan divines, and of bishops and other leading Anglican divines, which met under his presidency at Hampton Court in January 1604. After both sides had been heard, certain alterations were determined upon and were ordered by royal authority, with the general assent of Convocation. These alterations were not very numerous and of great importance, but such as they were they all went in the direction of catholicizing rather than of puritanizing the Prayer Book; the one exception being the substitution of some chapters of the canonical scriptures for some chapters of the Apocrypha, especially of the book of Tobit. Other changes were:

1. The addition of one more black letter Saint’s Day, viz.: Enuruchus (by error for Evuritus) on the 7th of September. This was a small but a very extraordinary and an inexplicable change to make. The only explanation offered, which is a pure guess and seems barely possible, is that it was desired to place some mark of dignity upon a day which during the late reign had been kept with great festivity as the birthday of Queen Elizabeth.

2. The words, “The absolution to be pronounced by the minister alone,” at Morning and Evening Prayer, were altered to “The Absolution, or Remission of Sins, to be pronounced by the priest alone, standing; the people still kneeling.”

3. A prayer for the royal family was added after the prayer for the king, and a petition was added in the Litany to the same effect, both exhibiting slight verbal differences from the prayer and petition as used to-day.

4. Thanksgiving prayers were added for rain, for fair weather, for plenty, for peace and victory.

5. Important alterations were introduced into the service for the private baptism of children in houses, with the object of doing away with lay baptism and securing the administration by the minister of the parish, or some other lawful minister.

6. The confirmation service was entitled and explained thus: “The Order of Confirmation, or Laying on of Hands upon Children Baptized, and able to render an account of their faith according to the Catechism following.”

7. The concluding portion of the Catechism, consisting of eleven questions on the sacraments, was now added.

There were other slight changes of a verbal kind, involving no doctrinal or political significance and which therefore need not be described here.

The next important stage in the history of the Prayer Book was its total suppression in 1645 for a period of fifteen years. “The Directory for the Public Worship in England and the Three Kingdoms” being established in its place. The restoration of King Charles II. in 1660 brought with it toleration at once, and soon afterwards complete restoration of the Prayer Book, but not exactly in the same form which it had before. Nonconformists pressed upon the king, either that the Prayer Book should not be re-introduced, or that if it were re-introduced, features which they objected to might be removed. The result was that a conference was held in 1661, known from its place of meeting as the Savoy Conference, the church being represented by twelve bishops and the Nonconformists by twelve eminent Presbyterian divines, each side accompanied by nine coadjutors.

The objections raised from the Nonconformist point of view were numerous and varied, but they were thoroughly discussed between the first meeting on the 15th of April and the last on the 24th of July 1661; the bishops agreeing to meet the Puritan wishes on a few minor points but on none of fundamental importance. Later in the year, between the 20th of November and the 20th of December, an act of parliament undertaken the revision of the Prayer Book. In the earlier part of the following year the book so revised came before parliament. No amendment was made in it in either house and it finally received the royal assent on the 19th of May 1662, being annexed to an Act of Uniformity which provided for its coming into general and compulsory use on St Bartholomew’s Day (Aug. 24).

The alterations thus introduced were very numerous, amounting to many hundreds, and many of them were more important than any which had been introduced into the Prayer Book since 1552. Their general tendency was distinctly in a Catholic as opposed to a Puritan direction, and the two thousand Puritan incumbents who vacated their benefices on St Bartholomew’s Day rather than accept the altered Prayer Book bear eloquent testimony to that fact.

It is impossible to give here an exhaustive list of the alterations; but the following were some of the principal changes made in 1662.

(a) The preface “It hath been the wisdom of the Church of England,” composed by Sandys, bishop of Lincoln, was prefixed to the Prayer Book.

(b) The authorized version of the Bible of 1611 was taken into use, except in the case of the Psalms, where the great Bible of 1539-1540 was retained as much smoother for singing, and in parts of the Consecration service.

(c) The rubric preceding the absolution in Morning and Evening Prayer was altered to “The Absolution to be pronounced by the minister alone,” was altered into “The Absolution, or Remission of Sins, to be pronounced by the priest alone, standing; the people still kneeling.”

(d) In the Litany theALTARS, PRIESTS, and Bishops were altered to “Bishops, Priests and Deacons,” and in the clause commencing “From all sedition and privy conspiracy,” etc., the words “rebellion” and “schism” were added. (e) Among the “Prayers and Thanksgivings upon several occasions,” were added the two Ember week prayers, the prayer for the high court of parliament, the collect or prayer for all conditions of men, the general thanksgiving, and that For restoring Public Peace at Home.

(f) In the Consecration service, two rubrics were prefixed to the prayer for the whole state of Christ’s Church militant here on earth “ordering the humble presentation and placing of the alms upon the Holy Table, and the placing thereon then of so much Bread and Wine as the priest shall think sufficient for the communion of the clergy and the communicants of the said church, and the consecration of the same.”

(g) The words to the real and essential real presence of Christ’s natural flesh and blood were altered to “unto any Corporal Presence of Christ’s natural Flesh and Blood”—a very important and significant alteration which affected the meaning of the whole rubric, and which was condemned by the Council of Trent.

(h) Rubrics concerning the communion by the priest in the prayer of consecration, and the covering of the same, and the remaining of the consecrated elements after Communion with a fair linen cloth. (i) A new office was added for the Ministration of Baptism, which was to be used “for any that die unbaptized, or excommunicate, or have laid violent hands upon themselves.” (j) In the Office for the Clergy of the Roman Church the rubric for ordination, after the words, “Receive the Holy Ghost,” these words were added: “for the Office and Work of a Priest (or Bishop) in the Church of God, now committed unto thee by the Imposition of our hands.” (k) The ornaments rubric, regulating the vesture of the
clergy was thrown into its present shape, referring back not to 1604 or 1559 or 1552, but to the first Prayer Book of Edward VI. in 1549 for the rule to be followed.

The above are the important alterations, among numerous others of minor significance, introduced into the Prayer Book in 1662. Their general trend is obvious. It is not in the Puritan direction, but intended to emphasize and to make more clear church doctrine and discipline, which in recent years had become obscured or decayed. No substantial alteration has been made in the Prayer Book since 1662, but two alterations must be chronicled as having obtained the sanction of the Convocations of Canterbury and York, and also legal force by act of parliament. In 1871 a new Lectionary was substituted for the previously existing one, into the merits and demerits of which it is not possible to enter here; and in 1872, by the Act of Uniformity Amendment Act, a shortened form of service was provided instead of the present form of Morning and Evening Prayer for optional use in other than cathedral churches on all days except Sunday, Christmas Day, Ash Wednesday, Good Friday and Ascension Day; provision was also statutorily made for the separation of services, and for additional services, to be taken, however, except so far as anthems and hymns are concerned, entirely out of the Bible and the Book of Common Prayer.

In the year 1907 letters of business were issued by the Crown to the Convocations inviting and enabling them to make alterations in the Prayer Book (afterwards to be embodied in an act of parliament). These letters were issued in compliance with the second recommendation (1906) of the Royal Commission on Ecclesiastical Discipline, viz.: that “Letters of business should be issued to the Convocations with instructions: (a) to consider the preparation of a new rubric regulating the ornaments (that is to say, the vesture) of the ministers of the church, at the times of their ministrations, with a view to its enactment by parliament; and (b) to frame, with a view to their enactment of parliament, such modifications in the existing law relating to the conduct of Divine Service, and to the ornaments and fittings of churches as may tend to secure the greater elasticity which a reasonable recognition of the comprehensiveness of the Church of England and of its present needs seems to demand.”

A few words are added in conclusion about the state services. Until the year 1859 they were four in number.

1. A Form of Prayer with Thanksgiving to be used yearly upon the Fifth Day of November, to commemorate the happy deliverance of King James I. and the Three Estates of England from the Gunpowder Plot in 1604.
2. A Form of Prayer with Fasting to be used yearly on the Thirtieth Day of January, to commemorate the Martyrdom of the Blessed Charles, later King Charles the First, in 1649.
3. A Form of Prayer with Thanksgiving to be used yearly on the Twenty-ninth Day of May, to commemorate the Restoration to the throne of King Charles the Second in 1660.
4. A Form of Prayer with Thanksgiving to be used yearly on the Day of the Accession of the reigning Monarch.

The first three of these services were abolished in 1859 by royal warrant—that is to say by the exercise of the same authority which had instituted them. The fourth form of service was retained in its existing form when a new form, or rather new forms of service, having been prepared by Convocation, were authorized by royal warrant on the 9th of November.

(F. E. W.)

PRAYERS FOR THE DEAD. Wherever there is a belief in the continued existence of man’s personality through and after death, religion naturally concerns itself with the relations between the living and the dead. And where the idea of a future judgment obtains, prayers are often offered on their behalf to the Higher Powers. Prayers for the dead are mentioned in 2 Mac- cabees xii. 43-45, where the writer is uncertain whether to regard the sacrifice offered by Judas as a propitiatory sin-offering or as a memorial thank-offering, a distinction of great importance in the later history of the practice. Prayers for the dead form part of the authorized Jewish services. The form in use in England contains the following passage: “Have mercy upon him; pardon all his transgressions . . . Shelter his soul in the shadow of Thy wings. Make known to him the path of life.” The only passage in the New Testament which is held to bear directly on the subject is 2 Tim. i. 18, where, however, it is not certain that Onesiphorus, for whom St Paul prayed, was dead. Outside the Bible the proof of the early use of prayers for the dead has been carried a step farther by Professor Ramsay’s discoveries, for it is now impossible to doubt the genuineness of the copy (contained in the spurious acts of the saint) of the inscription on the tomb of Abercius of Hierapolis in Phrygia (see Lightfoot, Apostolic Fathers, pt. ii. vol. i. p. 492 sqq.). The 10th line of the inscription runs thus: “Let every friend who observeth this pray for me,” i.e. Abercius, who throughout speaks in the first person: he died in the latter part of the 2nd century. The inscriptions in the Roman catacombs bear similar witness to the practice, by the occurrence of such phrases as “Mayst thou live among the saints” (3rd century); “May God refresh the soul of . . . ; “Peace be with them.” Among Church writers Tertullian is the first to mention prayers for the dead, and that not as a concession to natural sentiment, but as a duty: “The widow who does not pray for her dead husband has as good as divorced him.” This passage occurs in one of his later Montanistic writings, dating from the beginning of the 3rd century. Subsequent writers similarly make incidental mention of the practice as prevalent, but not as unlawful or even disputed (until Aelius challenged it towards the end of the 4th century). The most famous instance is St Augustine’s prayer for his mother, Monica, at the end of the 9th book of his Confessions.

An important element in the liturgies of the various Churches consisted of the dyptichs or lists of names of living and dead who were to be commemorated at the Eucharist. To be inserted in these lists was an honour, and out of the practice grew the canonization of saints; on the other hand, to be excluded was a condemnation. In the middle of the 3rd century we find Cyprian enjoining that there should be no oblivion or public prayer made for a deceased layman who had broken a Church rule by appointing a cleric trustee under his will: “He ought not to be named in the priests’ prayer who has done his best to detain the clergy from the altar.” Although it is not possible, as a rule, to name dates for the exact words used in the ancient liturgies, yet the universal occurrence of these dyptichs and of definite prayers for the dead in all parts of the Church in the 4th and 5th centuries tends to show how primitive such prayers were. The language used in the prayers for the departed is very reserved, and contains no suggestion of a place or state of pain. We may cite the following from the so-called liturgy of St James:—

“Remember, O Lord, the God of Spirits and of all Flesh, those whom we have remembered and those whom we have not remembered, men of the true faith, from righteous Abel unto-day; do thou thyself give them rest there in the land of the living, in thy kingdom, in the delight of Paradise, in the bosom of Abraham, Isaac and Jacob, our holy fathers, from whence pain and sorrow and sighing have fled away, where the light of thy countenance visiteth them and always shineth upon them.”

Public prayers were only offered for those who were believed to have died as faithful members of Christ. But Perpetua, who was martyred in 202, believed herself to have been encouraged by a voice, and those who were convinced that their friend who had died in his eighth year, almost certainly unbaptized; and a later vision assured her that her prayer had been answered and she translated from punishment. St Augustine thought it needful to point out that the narrative was not canonical Scripture, and contended that the child had perhaps been baptized. Similarly, a medieval legend relates that Gregory the Great was so struck with the justice of the emperor Trajan, that he prayed for him, and in consequence he was admitted to Paradise (cf. Dante, Purg. x., Parad. xx.).

As time went on, further developments took place. Petitions to God that he would hear the intercessions of the departed became direct requests to them to pray (Ora pro nobis); and, finally, the saints were asked themselves to grant grace and help. Again, men felt difficulty in supposing that one who repented at the close of a wicked life could at once enjoy the fellowship of the saints in Paradise (St Luke xxiii. 43), and it seemed unfair that they should be made equal with those who bore the
burden and heat of the day (St Matt. xx. 12). And so the simple severance between good and bad indicated in St Luke vi. 26, became the threefold division made familiar by Dante. These speculations were further fixed by the growth of the theory of satisfaction and of Indulgences: each forgiven soul was supposed to have to endure an amount of suffering in proportion to the guilt of its sins, and the prayers and pious acts of the living availed to shorten that penance time in Purgatory (see Indul-
gences). It thus came about that prayers for the dead were regarded only as aiding at the deliverance of souls from pur-
gatorial fires; and that application of the Eucharist seems to have overshadowed all others. The Council of Trent attempted certain reforms in the matter, with more or less success; but, broadly speaking, the system still remains in the Roman Catholic Church, and masses for the dead are a very important part of its acts of worship.

The Reformation took its rise in a righteous protest against the sale of Indulgences; and by a natural reaction the Protestants, in rejecting the Roman doctrine of Purgatory, were inclined to disuse all prayers for the dead. Important changes have been made, in the successive revisions of the Prayer Book, in the commemorations of the dead at the Eucharist and in the Burial Service.

In the Communion Service of 1549, after praise and thanks were offered for all the saints, chiefly the Blessed Virgin, came the following: “We commend into thy mercy all other thy servants, which are departed hence from us with the sign of faith and now do rest in the sleep of peace: grant unto them, we beseech thee, thy mercy and everlasting peace.” The Burial Service of the same date contained explicit prayers for the deceased, and introit, collect, epistle and gospel were provided for the Celebration of the Holy Communion when there is a Burial of the Dead.” In 1552, under the influence of Bucer, all mention of the dead, whether commemorative or intercessory, was cut out of the Eucharist; the prayers in the Burial Service were brought into their present form; and the provision for Holy Communion at a Burial was omitted. The thankful commemoration of the dead in the Eucharist was restored in 1661, but prayers for them remained, if they remained at all, veiled in ambiguous phrases.

The Church of England has never forbidden prayers for the dead, however little she has used them in her public services. It was proposed in 1532 to condemn the scholastic doctrine De precatione pro defunctis in what is now the 22nd of the Thirty-Nine Articles, but the proposal was rejected. And these inter-
cessions have been used in private by a long list of English divines, among whom Andrews, Cosin, Ken, Wesley and Keble form an almost complete chain down to the present day. On the 28th of November Bishop Barrow (1680) stands a request to passers-by to pray for their fellow-servant. And in a suit (1838) as to the lawfulness of an inscription, “Pray for the soul of . . .,” the Court decided that “no authority or canon has been pointed out by which the practice of praying for the dead has been expressly prohibited.” As Jeremy Taylor put it (Dissuasive from Popery, I. iv.), “General prayers for the dead the Church of England never did condemn by any express articles, but left it in the middle.”

**PRAYING WHEEL,** a mechanical apparatus used by the Lamaist Buddhists in Tibet and elsewhere for offering prayers. Strips of paper bearing a manifold repetition of the words “The Jewel in the Lotus, Amen,” are wrapped round cylinders of all sizes—from hand-mills to wind- or water-mills. As the wheels revolve these uncoil and the prayer is considered to be offered.

**PREACHING** (Fr. prêcher, from Lat. praedicare, to proclaim), the proclamation of a Divine message both to those who have not heard it, and to those who, having heard it, have not accepted it, and the regular instruction of the converted in the doctrines and duties of the faith, is a distinctive though not a peculiar feature of the Christian religion. The Mahometans exercise it freely, and it is not unknown among the Buddhists. The history of Christian preaching with which alone this article is concerned has its roots (1) in the activity of the Hebrew prophets and scribes, the former representing the broader appeal, the latter the edification of the faithful, (2) in the ministry of Jesus Christ and His apostles, where again we have both the evan-
geligal invitation and the teaching of truth and duty. Whic-
hever element is emphasized in preaching, the preacher is one who believes himself to be the ambassador of God, charged with a message which it is his duty to deliver.

1. The Patristic Age, to the Death of St Augustine, A.D. 430.—

Of the first two centuries we have very little information.
From the Acts of the Apostles we gather something as to the methods adopted by St Peter and St Paul, and these we may believe were more or less general. The Apostles who had known the Lord would naturally recall the facts of His life, and the story of His words and works would form a great deal of their preaching. After they had passed away and before the Christian Scriptures were canonically sifted and collected there was a gap which for us is only slenderly filled by such productions as the so-called 2nd Epistle of Clement, really a rambling homily on repentance and confession (see Clementine Literature), and by what we can imagine was the practice of men like Ignatius and, on the other hand, the Apologists. Most of these were primarily writers, but Justin Martyr has left a reputation for speaking, especially in debate, as well. Some of the writings of Tertullian (c. 200), e.g. those on *Patience and Penitence,* read as though they had been spoken, and it is hard to believe that this brilliant rhetorician did not consecrate his powers of address to his new faith. Cyprian (d. 258), too, was a finished speaker; his *Epistle to Donatus* emphasizes the need of a simple and un-
dercorated style in the proclamation of the gospel. None of his sermons, however, unless we regard his book on the Lord’s Prayer as a homily, has come down to us.

By this time the canon of the New Testament Scripture was fairly settled, and with Origen (d. 254) we find the beginning of preaching as an explanation and application of definite texts. Origen was pre-eminent a teacher, and the didactic side of preaching is thus more conspicuous in his work. When we allow for his excessive use of the allegorical method, there is still left a great deal of power and suggestiveness. In his hands, as may be seen from the 10 homilies on Jeremiah that have been preserved in the Greek (and others in the Latin of Rufinus), the crude homily of his predecessors began to take a more dignified, orderly and impressive form. Alongside Origen we may rank Hippolytus of Rome on the strength of the one sermon of his which is extant, a panegyric on baptism based on the theophany which marked the baptism of Jesus. The 4th century marks the culmination of early Christian preaching. The imperial patronage had made education and social distinctions a greater possibility for the preacher, and the decline of political eloquence furnished an opening for pulpil oratory. The didactic element was no longer in sole possession of the field, for the inrush of multitudes to the Christian faith and the building of large churches necessitated a return to the evangelical or proclamatory type of sermon. It was the age of doctrinal controversy, and the intellectual presentation of the Christian position was thus sharpened and developed. The Antiochene school had set a worthy example of careful exegesis of scripture. It was in the East especially that preaching flourished: Eusebius of Caesarea, Eusebius of Elmes, Athanasius, Macarius, Cyril of Jerusalem, Ephraem Syrus among the ortho-
dox; and of the Africans, Arius himself and Ulfilas the great pastor of the Goths were all of high quality; but above even these stand out the three Cappadocians Basil (q.v.), of Caesarea, cultured, devout and practical; his brother Gregory (q.v.) of Nyssa, more inclined to the speculative and metaphysical, and Gregory (q.v.) of Nazianzus, richly endowed with poetic and oratorial gifts, the finest preacher of the three. At the apex of the pyramid stands John of Antioch, Chrysostom (q.v.), who in 387, at the age of 40, began his 12 years’ ministry in his native city and in 399, the six memorable years in Constantinople, where he loved
of the poor, withstood tyranny and preached with amazing power. His sermons, says Dr E. C. Dargan, "show the native oratorical instinct highly trained by study and practice, a careful and sensible (not greatly allegorical) interpretation of Scripture, a deep concern for the spiritual welfare of his charge, and a thorough consecration to his work. His style is impetuous, rich, torrential at times; his thought is practical and imaginative rather than deeply philosophical. His knowledge of human nature is keen and ample, and his sermons are a remarkable reflection of the manners and customs of his age. His ethical appeal is constant and stimulating."

In the West the allegorical method of Alexander had more influence than the historical exegesis of Antioch. This is seen in Ambrose of Milan, with whom may be named Hilary of Poitiers and Gaudentius of Brescia, the friend of Chrysostom, and a link between him and Ambrose. But the only name of first rank in preaching is that of Augustine, and even he is curiously unequal. His fondness for the allegorical and his manifest carelessness of preparation disappoint as often as his profundity, his devout mysticism, his practical application attract and satisfy. Augustine's De doctrina Christiana, bk. iv., is the first attempt to formulate the principles of homiletic. August's De opera et officiis, who, with the days of Chrysostom and Augustine there was a great decline of preaching. With the poor exceptions of one or two names like those of Theodore of Mopsuestia and John of Damascus, the Eastern Church produced no preachers of distinction. The causes of the ebb were both internal and external. Within the Church there was a departure from the great experimental truths of the Gospel, their place being taken by the preaching of nature and morality on a theistic basis. To this we may add a fantastic and absurd allegorisation, the indiscriminate laudation of saints and martyrs, polemical strife, the hardening of the doctrine into dogma, the development of a narrow ecclesiasticism, and the failure of the missionary spirit in the orthodox section of the Eastern Church (as contrasted with the marvellous evangelistic activity of the Nestorians q.v.). Outside the Church the break-up of old civilizations, the confused beginnings of medieval kingdoms, with the attendant war and rapine, the inroads of the Saracens and the rise of Islam, were all effective silencers of the pulpit. Very the nightly stories rather than the stories of the Church, and Augustine, Leo the Great and Gregory the Great could preach, and the missionaries Patrick, Columba, Columbanus, Augustine, Wilfrid, Willibrord, Gall and Boniface are known by their fruits. The homilies of Beda are marked by a tender devoutness, and here and there rise to glowing eloquence. In the 8th century Charlemagne, through the Capitularies, tried in vain to galvanize preaching; such specimens as we have show the sermons of the times to be marked by superstition, ignorance, formality and plagiarism. It was the age when the papacy was growing out of the ruins of the old Roman Empire, and the best talents were devoted to the organization of ecclesiasticism rather than to the preaching of the Word. Liturgies were taking shape, penance was deemed of more importance than repentance, and there was more insistence on discipline than on Christian morality. Towards the end of the period we note the beginnings of the triple division of medieval preaching into cloisteral, parochial and missionary or popular preaching, a division based at first on audiences rather than on subject-matter, the general character of which—legends as popular stories rather than as comment on Scripture—was much the same everywhere. About this time, no doubt, some preachers began to use the vernacular, though no examples of such a practice have been preserved.

There are few great names in the 9th, 10th and 11th centuries: Anselm was a great Churchman, but no great preacher; perhaps the most worthy of mention is Anskar, the missionary to the Scandinavians. Rabanus Maurus published an adaptation of Augustine's De doctrina Christiana, bk. iv. But certain forces were at work which were destined to bring about a great revival, viz. the rise of the scholastic theology, the reforms of Pope Hildebrand, and the preaching of the First Crusade by Pope Urban II. (d. 1099) and Peter the Hermit.

3. The Later Medieval Age, 1100-1300.—In the 12th century the significant feature is the growing use of the various national languages in competition with the hitherto universal Latin. The most eminent preacher of the century was Bernard of Clairvaux (1091-1153), esteemed alike by gentle and simple, and summing up the popular scholastic and mystical types of preaching. His homilies, though tediously minute, still breathe a charm and power (see Bernard, St.).

Alongside Bernard may be placed the two mystics of St Victor, Hugo and Richard, and a little later Peter Waldo of Lyons, who, like Henry of Lausanne, preached a plain message to the poor and lowly. The 13th century saw the culmination of medieval preaching, especially in the rise of the two great mendicant orders of Francis and Dominic. Representative Franciscan names are Antony of Padua (d. 1231), who travelled and preached through southern Europe; Berthold of Regensburg (d. 1272), who, with his wit and pathos, imagination and insight, drew huge crowds all over Germany, as in homeliest vernacular he denounced sin with all the severity of a John the Baptist; and Francis Bonaventura, the schoolman and mystic, who wrote a little book on The Art of Preaching. Of the Dominicans Thomas Aquinas (d. 1274), the theologian, was perhaps also the greatest preacher of the 13th century. Yet the whole of the preaching and the order, the mendicant preaching, is struck; but on the whole there was a drop from the high level of the 13th. In Italy Bernardino of Siena on the scholastic side, Robert of Lecce and Gabriel Barletta on the popular, are the chief names; in Germany these phases are represented by John Gritsch and John Geller of Kaiserburg respectively. Among the popular preachers vigour was often blended with coarseness and vulgarity. Mysticism is represented by Suso, Meister Eckhart, above all Johann Tauler (q.v.) of Strassburg (d. 1461), a true prophet in an age of degeneration. Towards the close of the century comes John Wycliffe (q.v.) and his English travelling preachers, who passed the torch to Hus and the Bohemians, and in the next age Savonarola, who was to Florence what Jeremiah had been to Jerusalem.

4. The Reformation Period, 1500-1700.—It is here that the story of modern preaching may be said to begin. The Reformers gave the sermon a higher place in the ordinary service than it had previously held, and they laid special stress upon the interpretation and explication of Scripture. The controversy with Rome, and the appeal to the reason and conscience of the individual, together with the spread of the New Learning, gave preaching a new force and influence which reacted upon the old faith, as John Wild (d. 1554), one of the best Roman Catholic preachers of the day, a man noted for his "emphasis on Scripture, his grasp of evangelical truth, his earnest piety, amiable character and sustained power in the pulpit," fully admitted. Other famous preachers on the same side were the Spaniards Luis de Granada and Thomas of Villanueva, the Italians Cornelio Musso, Egidio of Viterbo and Carlo Borromeo, and the German Peter Canisius. Among the Reformers were, of course, Martin Luther and most of his German collaborators; the Swiss Zwingli, Bullinger, Farel and Calvin; the English Latimer, John Bradford, John Jewel; the Scot John Knox. Nor can even so cursory a sketch omit to mention Bernardino Ochino and the Anabaptist Hübmaier. In all these cases fuller details will be found in the articles bearing their names. Most of the Reformation preachers read their sermons, in contrast to the practice of earlier ages. The English Book of Homilies was compiled because competent preachers were so rare. The 17th-century preaching was, generally speaking, a continuation of that of the 16th century, the pattern having been set by the Council of Trent and by the principles and practice of the Reformers. In Spain and Germany, however, there was a decline of power, in marked contrast to the vigour manifested in France and England. In France, indeed, the Catholic pulpit now came to its perfection, stimulated, no doubt, by the toleration accorded to the Huguenots up to 1685 and by the patronage of Louis XIV. The names of Bossuet, Fléchier, Bourdaloue, Fénelon and Massillon, all supreme preachers, despite a certain artificial pomposity, belong here, and on the reformed side.
are Jean Claude (d. 1687), author of the Essay on the Sermon, and Jacques Saurin (d. 1736). In England the rivalry was not between a Reformer, but between Anglican and Nonconformist, or, if we may use the wide but less correct term, Puritan. On the one hand are Andrewes, Hall, Chillingworth, Jeremy Taylor, Barrow and South; on the other Baxter, Calamy, the Goodwins, Howe, Owen, Bunyan, in each case but a few names out of many. The sermons of these men were largely scriptural, the cardinal evangelical truths being emphasized with reality and vigour, but with a tendency to abstract theology rather than concrete religion. The danger was felt by the university of Cambridge, which in 1674 passed a statute forbidding its preachers to read their sermons.

Germany, harassed by the Thirty Years' War and deadened by a rigid Lutheranism, can show little besides Andrea and Johann Arndt until the coming of the Pietists (see Pietism). A. H. Francke and Philipp Spencer, with Paul Gerhardt and his cousin Johann. The early years of the 18th century were a time of dreadness as regards preaching. The Illumination in Germany and Deism in England were largely responsible for this, though the names of J. A. Bengel (better known as a commentator), Zinzendorf, Butler and the Erskines helped to redeem the time from the despair of being the dark age of Protestantism. In the Roman Catholic Church the greatest force was Bridaine in France, a popular preacher of high worth. But, generally speaking, there was no heart in preaching, sermons were unimpassioned, stilted and formal presentations of ethics and apologetics, seldom delivered extempore.

5. The Modern Period may be said to begin in 1738, the year in which John Wesley began his memorable work. Preaching once more was based on the Bible, which was expounded with force and earnestness, and though throughout the century there remained a good many pulpits who produced nothing but solemn fudge, the example and stimulus given by Wesley and Whitefield was alone immeasurably productive. Whitefield was the greater orator, Wesley the better thinker; but, diverse in temperament as they were, they alike laid emphasis on open-air preaching. In their train came the great field preachers of the Westerns, like John Eliot and Christmas Evans, and later the Primitive Methodists, who by their camp meetings and itineraries kept religious enthusiasm alive when Wesleyan Methodism was in peril of hardening. Meanwhile, in America the Puritan tradition, adapted to the new conditions, is represented by Cotton Mather, and later by Jonathan Edwards, the great preacher of his time and country. Whitefield's visits raised a band of pioneer preachers, cultured and uncultured, men who knew their Bibles but often interpreted them awry.

In the early 19th century the pulpit had a great power, especially in Wales, where it was the vehicle of almost every kind of knowledge. And it may be doubted whether, all in all, preaching has ever reached so uniformly high a level or been so powerful a force as during the 19th century, and this in spite of other forces similarly making for enlightenment and morality. It shared to the full in all the quickening that transformed so many departments of civilization during that epoch, and has been specially influenced by the missionary enterprise, the discoveries of science, the fuller knowledge of the Bible, the awakened zeal for social service. Modern preaching, like ancient preaching, has been so varied, depending, as it so largely does, on the personality of the preacher, that it is not possible to speak of its characteristics. Nor can one do more than enumerate a few outstanding modern names, exclusive of living preachers. In the Roman Catholic Church are the Italians Ventura and Curci, the Germans Diepenbrock and Foerster, the French Lacordaire, Dupanloup, Loyou (Père Hyacinthe) and Henri de Lubac (Père Anatole); German preachers, Claus Harms, Tholuck and F. W. Krummacher; France, Vinet and the Monods. In England representative Anglican preachers were Newman (whose best preaching preceded his obedience to Rome), T. Arnold, F. W. Robertson, Liddon, Farrar, Magee; of Free Churchmen, T. Binney, Thomas Jones, R. W. Dale and Joseph Parker (Congregationalist); Robert Hall, C. H. Spurgeon and Alexander Maclaren (Baptists); W. M. Punshon, Hugh Price Hughes and Peter Mackenzie (Wesleyan); James Martineau (Unitarian). The Scottish Churches gave Edward Irving, Thos. Chalmers, R. S. Candlish, R. M. McCheyne and John Caird. In America, honoured names are those of W. E. Channing, Henry Ward Beecher, Horace Bushnell, Phillips Brooks, to mention only a few.

See J. M. Neale, Medieval Preachers and Preaching (1857); R. Roth, Geschichte der Predigt vom Anfang bis auf Schleiermacher (1881); J. P. Mahaffy, Decay of Modern Preaching (1882); E. C. Dungan, A History of Preaching (1906), and preface to The Pulpit Encyclopaedia, vol. i. (1900);) and the various volumes of the Yale Lectures on Preaching. Also sermon.

PREAMBLE (Med. Lat. præambulum, from præambulare, to walk before), an introductory statement, a preliminary explanation. The term is particularly applied to the opening paragraph of a statute which summarizes the intention of the legislature in passing the measure, thus the preamble of the statute, which the title is the Children Act 1908, is as follows: "An Act to consolidate and amend the Law relating to the Protection of Children and Young Persons, Reformatory and Industrial Schools and Juvenile Offenders, and otherwise to amend the Law with respect to Children and Young Persons." The procedure in the British parliament differs in regard to the preambles of public and private bills. The second reading of a public bill affirms the principle, and therefore in committee the preamble stands postponed till after the consideration of the clauses, when it is considered in reference to those clauses as amended and altered if need be (Standing Order 35). On the other hand, the preamble of a private bill, if opposed, is considered first in committee, and counsel for the bill deals with the expediency of the bill, calls witnesses for the allegation in the preamble, and petitions against the bill are then heard; if the preamble is negatived the bill is dropped, if affirmed it is gone through clause by clause. On the passage of a private bill, the preamble has also to be proved, more especially with regard to whether the clauses required by the standing orders are inserted (see May, Parliamentary Practice, 1906, pp. 483, 488 seq.).

PREANGER, a residence of the island of Java, Dutch East Indies, bounded S. by the Indian Ocean, W. by Bantam, N. by Batavia and Krawang, and N.E. and E. by Cheribon and Banyumas. It is officially termed the Preanger Regencies, of which there are five, covering the several administrative divisions. It also includes the small island of Nusa Were. The natives are Sundanese. The whole residency is mountainous, but there are two main parallel ranges of peaks along the northern boundary and through the middle. Among these are to be found a singularly large number of both active and inactive volcanoes, including the well-known Salak and Gedee in the north, and bunched together at the eastern end the Chikorai, Papandayan, Wayang, Malabar, Guntur, &c., ranging from 6000 to 10,000 ft. in height. The rivers of the province belong to the basins of the Indian Ocean and the Java Sea respectively, the water-parting being formed by the western and eastern ends respectively of the northern and southern lines of mountain peaks. The two which drain the largest basin are the Chi Manuk and the Chi Tarum, both rising in the eastern end of the province and flowing north-east and north-west respectively to the Java Sea. The Chi Tandui, also rising here, flows south-east to the Indian Ocean, and alone of all the rivers in this province is navigable. Large stretches of marsh occur on each side of this river, as well as here and there among the hills where inland lakes formerly existed, as, for instance, near Bandung. Crater lakes are Telaga (lake) Budas, in the crater of the volcano of the same name in the south-east, and Telaga Waru, on the slopes of the Gedee, with its beautiful tinting. On the same side of the Gedee is the health resort of Sindanglaya (founded 1859-1860), with a mineral spring containing salt, and close by is the country residence of Chipanas, belonging to the governor-general.

Numerous warm springs are scattered about this volcanic region. Petroleum and coal have been worked, and there is a rich yield of chalk, while a good quality of bricks is made from the
red clay. The soil is in general very fertile, the principal products being rice, maize and pulse (*kachang*) in the lower grounds, and cinchona, coffee and tea, as well as cocoa, tobacco and fibrous plants in the hills. The coffee cultivation has, however, considerably diminished. Forest culture, mat-making, weaving and fish-breeding are also practised, the last-named in the marshes after the rice harvest. The plantations are almost entirely owned by the government and Europeans, but the rice mills are in the hands of Chinese. Irrigation works have been carried out in various parts. The principal towns are Bandung, the capital of the residency, Sukabumi, Cianjur, Sumedang, Chichalengka, Garut, Tasik Malaya and Manon Jaya, all with the exception of Sumedang connected by railway.

**PREBENDARY** (Lat. *praebenda* = give or grant, through Low Lat. *praebenda*), one who holds a prebend, namely an endowment in land, or pension in money, given to a cathedral or conventual church in *praebenda*—that is, for the maintenance of a secular priest or regular canons. In the early Church the title had a more general signification. The word *praebenda* originally signified the daily rations given to soldiers, whence it passed to indicate daily distributions of food and drink to monks, canons, &c. It became a frequent custom to grant such a prebend from the resources of a monastery to certain poor people or to the founder. Such persons were, literally, *prebendaries*. At a later date, when the custom in collegiate churches of living in common had become less general, a certain amount of the church revenue was divided among the clergy serving such a church, and each portion (no longer of meat or drink only) was called a *prebend*. The clergy of such churches were generally canons, and the titles *canon* and *prebendary* were, and are, sometimes used as synonymous. A member of such a college is a canon in virtue of the spiritual duties which he has to perform, and the assignation of a portion of his income in church and a place in chapter; he is a prebendary in virtue of his benefice. In the Roman Catholic Church the duties of a prebendary as such generally consist in his attendance at choral office in his church. In the Anglican Church he usually bears his part in the conducting of the ordinary church services, except when he has a vicar, as in the old cathedral foundations (see CATHEDRAL). A prebendary may be either simple or a dignity. In the former case he has no cure and no more than his revenue for his support; in the latter he has always a jurisdiction annexed. In the Anglican Church the bishop is of common right patron of all prebends, and if a prebend is in the gift of a lay patron he must present his candidate to the bishop who institutes as to other benefices. No person may hold more than one prebend in the same church; therefore, if a prebendary accepts a deanship in his church, the prebend becomes void by cession. A prebend is practically a sinecure, and the holder has no cure of souls as such. He may, and often does, accept a parochial office or chaplaincy in addition.

In the middle ages there were many less regular kinds of prebends; e.g. *praebenda doctoralis*, with which teaching duties were connected, *praebenda lectoralis*, *praebenda missarum*, to which the duty of saying a mass was attached, *praebenda mortuaria*, founded for the saying of masses for the dead. Chantries belonged to this class. All these prebends were generally assigned to special holders, but there were also *praebenda currentis*, which were not held by any persons in particular. Sometimes prebends were held by boys who sang in choir, *praebenda puellis*. Occasionally the name of prebendary was applied to those servants in a monastery who attended to the food. In England the word *praebendary* was sometimes used as synonymous with *prebend*, as *prebend* was occasionally used for *prebendary*.

Du Cange, *Glossarium mediae et infimae latinitatis*, ed. L. Favre (Niort, 1883, 8c.); Mignet, *Encyclopédie théologique*, 1st series, vol. x. (s. a. in particular). Sometimes prebends were held by boys who sang in choir, *praebenda puellis*. Occasionally the name of prebendary was applied to those servants in a monastery who attended to the food. In England the word *praebendary* was sometimes used as synonymous with *prebend*, as *prebend* was occasionally used for *prebendary*.

**PRE-CAMBRIAN.** In geology, the enormously long and indistinctly defined period of time anterior to the Cambrian period. In the restricted sense in which it is now often employed it embraces a period or group of periods subsequent to the Archean (q.v.) and anterior to the Cambrian, although some writers still prefer to include the former. The superior limit of pre-Cambrian rocks is fixed by the *Olenellus* fauna, although at the base of the Cambrian (some geologists speak of certain pre-Olenellus beds as *eco-Cambrian*); the lower limit has not yet been generally established, though it is sufficiently clear in certain regions. The rocks of this period are much more obviously of sedimentary origin than those of the Archean; they include conglomerates, sandstones, greywackes, quartzites, slates, limestones and dolomites, which appear to have formed under conditions similar to those obtained in later epochs. Although the sediments prevail, they are often very highly metamorphosed and distorted by crustal movements; igneous rocks occur in great bulk in some regions. Fossils are usually extremely rare and very ill-preserved; but indications of protozoa, coelenterates, echinoderms, mollusks, mullusca, worms and arthropods have been distinguished. The name pre-Cambrian is the equivalent of the "Algonkian" of the United States Geological Survey, and of the "Protozoic" of other American authorities; the term "pre-Cambrian" is more generally used in Europe. Some archaics and others have also been applied to the same period.

Three or more great stratigraphical breaks have been recognized within the system of pre-Cambrian rocks; but how far these breaks ascertain in widely separated regions where they are found is difficult to determine in the absence of good palaeontological evidence.

The most striking development of pre-Cambrian rocks in Great Britain is the Torridonian (q.v.) group of the north-west highlands of Scotland, which lies with strong unconformability between the Lewisian gneiss and the basal quartzite of the Cambrian. The Elder or Dalradian (q.v.) strata of Scotland and their equivalents in Ireland and Anglesey may be in part, at least, of the same age.

In Shropshire, in the neighbourhood of the Welsh border, is the remnant of an ancient ridge now forming the Longmynd and the smaller hills to the west, Cader Caradoc, the Wrekin, and the Cardinghills, etc. The latter are built mainly of much altered porphyries and tuffs which C. Callaway named the Uriconian series; this series is clearly of pre-Cambrian age. The great mass of girta, flags and hornstones of the Longmynd cannot yet be definitely assigned to this period. The name Uriconian was given by J. F. N. Green (q. J. Geol. Soc., 1908, 64, p. 363) to denote that there is an upper Uradian (Rhyolitic) group, and a Lower Uradian (Trachytic) group, and that Hick's "Dimetian," the St Davids Group, and the Llandow Group are more or less intrusive in the Uradian. Both the pre-Cambrian volcanic rocks and the intruded granite are separated from the Cambrian by an unconformity.

In Finno-Scandinavia pre-Cambrian rocks are well developed. In the provinces of Finland瑞典, and Norway pre-Cambrian quartzite and Schistite formations; the latter, a coarse-grained felspathic sandstone, is very similar to the Torridonian of Scotland; it occurs also in Enonteki in Finland. Next in descending order come the Jotnian sandstones of Norway and Sweden, which are generally associated with pebbly conglomerates and slates and intrusive diabase and the Rappakivi granite. The Jutian group rests unconformably upon the Jatulian quartzites and schists, with slates, dolomite and carbonaceous beds (north of Lake Onega is a bed of anthracite 2 metres thick). Outflows of diabase and gabbro occur in this series, which extends from 1600 to 2000 metres in thickness. Below the Jutulian is another group of schistose sediments, the Kavalian, more strongly folded than the Jotnian, and probably analogous to the Shia Formation, and follow by unconformable junctions. These rocks are regarded by J. J. Soderholm as older than the Huronian of North America (possibly analogous to the Kewatin formation), and yet several groups of these rocks are included in the Jatulian series, so that the boundary between the Kavalian series and the granitic (Archean) complex is arbitrary.

Pre-Cambrian rocks occupy large areas and attain an enormous thickness in North America; all types of sediment are represented in various stages of metamorphism, and with these are igneous rocks, often developed upon a vast scale. They have been subdivided into the following groups or formations: an upper Keweanan
and a lower Huronian group; the latter is subdivided into an upper Anikian (north-east Minnesota) or Penokean (north-west Wisconsin); a middle and a lower division. Each of these four groups is separated by marked unconformity from the rocks above and below. Huronian rocks are well developed in the district which is the region of northern Michigan, comprising quartzites, slates and conglomerates, with important iron-bearing slates and schists and ferruginous cherts; in the Menominee district of Michigan and Wisconsin similar rocks occur; the Penokee-Gogebic district contains quartzites and conglomerates, with beds of diabase and olivine-gabbro; the same rocks occur in the Crystal Falls, north Michigan; the Mesabi and Vermilion districts, Minnesota, and north of Lake Michigan rock and are an important mining district. The various types of Mesabi, Penokee-Gogebic and Menominee belong mainly to the Amilikean group; in the Penokee rocks of this age vast thicknesses of igneous rocks constitute the greater part of the formations. Such rocks as granite and gneiss, together with the metamorphosed eugeosynclinal and the metamorphic orogenic rocks, have been, and limestones, with beds and dike of diabase and olivine-gabbro; the same rocks occur in the Crystal Falls, north Michigan; the Mesabi and Vermilion districts, Minnesota, and north of Lake Michigan rock and are an important mining district. The various types of Mesabi, Penokee-Gogebic and Menominee belong mainly to the Amilikean group; in the Penokee rocks of this age vast thicknesses of igneous rocks constitute the greater part of the formations. custom." Of the sovereign's will and pleasure the appropriate method of announcement is by warrant under the sign-manual, or letters patent under the great seal. But, although the Crown has at all periods very frequently conceded special privileges of rank and place to particular persons, its interference with the scale of general precedence has been rare and exceptional. In 1540 it was provided by warrant from Henry VIII. that certain officers of the household therein named should precede the secretaries of state when and if they were under the degree of barons.1 In 1612 James I. directed by letters patent, not without long and elaborate argument in the Star Chamber, that baronets, then newly created, should be ranked after the younger sons of viscounts and barons, and that a number of political and judicial functionaries should be ranked between knights of the Garter and such knights baronets as should be made by the sovereign in person "under his standard displayed in an army royal in open war." 2 Four years later he further directed, also by letters patent, that the sons of baronets and their wives and the daughters of baronets should be placed before the sons of knights and their wives and the daughters of knights "of what degree or order soever."3 And again in 1672, the same by a "solemn argument before his majesty" that the younger sons of earls should precede knights of the privy council and knights of the Garter not being "barons or of a higher degree."4 If we add to these ordinances the provisions relating to precedence contained in the statutes of several of the orders of knighthood which since then have been instituted or reconstructed, we shall nearly, if not quite, exhaust the catalogue of the interpositions of the sovereign with regard to the rank and place of classes as distinguished from individuals. Of "ancient usage and established custom" the records of the College of Arms furnish the fullest and most trustworthy evidence. Among them in particular there is a collection of early tables of precedence which were published by authority at intervals from the end of the 13th to the end of the 15th century, and to which peculiar weight has been attached by many successive generations of heralds. On them, indeed, as illustrative of and supplementary to the action of parliament and the Crown, all subsequent tables of precedence have been in great measure founded. The eldest is the "Order of All Estates in the Kingdom of England," apparently for the coronation of Henry IV. in 1399, under the supervision of Ralph Neville, earl of Westmorland and earl marshal; and the next is the "Order of All States of Worship and Gentry," prepared, as announced in the heading, for the coronation of Henry VI. in 1429, under the supervision of the lord protector Humphrey, duke of Gloucester, and the earl marshal, John Mowbray, duke of Norfolk. Two more are of the reign of Edward IV., and were severally issued by John Tiptoft, earl of Worcester and lord high constable, in 1467, and by Anthony Widville, Earl Rivers and lord high constable, in 1479. The latest is commonly and shortly known as the "Series Ordinum," and was drawn up by a special commission presided over by Jasper Tudor, duke of Bedford, it is presumed for observance at the marriage of Henry VII. and Elizabeth of York in 1486. To these may be added the "Order for the Placing of Lords and Ladies," taken at a grand entertainment given by command of Henry VIII. at the king's manor-house of Richmond in 1509 by Charles Somerset, earl of Worcester, lord chancellor of the household to the French ambassador Olivier de la Vernade, seigneur de la Bâtie; the "Precedency of All Estates," arranged in 1594 by the commissioners for executing the office of earl marshal; and the "Roll of the King's Majesty's Most Royal Proceeding through London" from the 7th Dublin Whitehall in the coronation of James I., also arranged by the commissioners for the said office of earl marshal. On many isolated points, too, of more or less importance, special declaratory decisions have been from time to time propounded by the earl marshal, their substitutes and deputies; for example, in 1594, when the younger sons of dukes were placed before viscounts; in 1625, when the rank of knights of the Bath and their wives was fixed; and in 1615 and 1671, when the eldest sons of the younger sons of peers were placed before the eldest sons of knights and of baronets. It is from these miscellaneous sources that the precedence among others of all peeresses, the eldest sons and their wives and the daughters of all peers, and the younger sons and their wives of all dukes, marquesses and earls is ascertained and established. And further, for the purpose of proving continuity of practice and disposing of minor questions not otherwise and more conclusively set at rest, the official programmes and accounts preserved by the heralds of different public solemnities and processions, such as coronations, royal marriages, state funerals, national thanksgivings and so on, have always been considered to be of great historical and technical value.5

1. General Precedence of Men. The sovereign; (1) prince of Wales; (2) younger sons of the sovereign; (3) grandsons of the sovereign; (4) brothers of the sovereign; (5) uncles of the sovereign; (6) nephews of the sovereign; (7) ambassadors; (8) archbishop of Canterbury, primate of all England; (9) lord high chancellor of Great Britain or lord keeper of the great seal; (10) archbishop of York, primate of England; (11) prime minister; (12) lord high treasurer of Great Britain.

2. Precedence of the Royal Family depends on their relationship to the reigning sovereign and not on their relationship to any of the predecessors of the reigning sovereign. It is provided by 31 Hen. VIII. c. 10 that no person, except only the King's children, shall have place "at the side of the Cloth of Estate in the Parliament Chamber," and that "the King's Son, the King's Brother, the King's Nephew, or the King's Brother's or Sister's Sons," shall have place before all prelates, great officers of state and peers. Lord Chief Justice Coke was of opinion that the king's nephew meant the king's grandson or nepos (Institutes, vol. iv. ch. 77). But, as Mr Justice Blackstone says, "under the description of the King's children his grandsons are held to be included without having recourse to Sir Edward Coke's interpretation of nepos" (Commentaries, vol. i. ch. 4). Besides, a grandson of the king would be the king's grandson if the king's grandson would be placed after the king's brother. The prince of Wales is not specifically mentioned in the statute "for the placing of the Lords," but, as he is always, whether the son or the grandson of the sovereign, he has the priority of the sovereign or the queen-consort. With the exception of the prince of Wales, all the male relations of the sovereign are ranked first in the order of their degrees of consanguinity with him or her, and secondly, in the last appointment to the lord chancellorship was that the members of the several groups into which the royal family is divided take precedence according to their own seniority and the seniority of their fathers or mothers, the sons of the sons or brothers of the sovereign being before the offspring of the sovereign by his consorts.

1. By 31 Hen. VIII. c. 10, the king's vicerect "for good and due ministration of justice in all causes and cases touching the realm, and for the better execution of the orders of the lord protector of Great Britain, the archbishop of Canterbury. The office of vicerect or vicar-general was then held by Thomas, Lord Cromwell, afterwards earl of Essex, together with that of lord privy seal, and it was never conferred on any man but the earl of Essex, the second brother of Edward VI. The bishops of Ireland had place next to the archbishops of England, and if consecrated before and not after the disestablishment of the Church in Ireland they retain this position under the Irish Church Act of 1869. At the coronation of William IV. the lord chancellor of Ireland walked before the lord chancellor of England and before the lord president of the council and lord privy seal. In Ireland, if he is a peer he has precedence between the archbishops of Armagh and Dublin, and if he is not a peer after the archbishop of Armagh, and if he has the rank of a peer, after the earl of Ormonde. The position of the lord chancellor of Great Britain or the lord keeper of the great seal is the same whether he is a peer or a commoner. The lord keeper has the same precedence as the lord chancellor under 8 Eliz. But if the last appointment to the lord chancellorship was that of Sir Robert Henley, afterwards Lord Henley, lord chancellor, and earl of Northlington, in 1757, and the office is not likely to be revived.
Britain; (13) lord president of the privy council; (14) lord keeper of the privy seal; (15) lord great master of Scotland; (16) lord high constable of England; (17) earl marshal; (18) lord high admiral; (19) lord steward of the household; (20) lord chamberlain of the household; (21) dukes; (22) marquesses; (23) dukes' eldest sons; (24) earls; (25) marquesses' eldest sons; (26) dukes' younger sons; (27) viscounts; (28) earls' eldest sons; (29) marquesses' younger sons.

The lord president of the council and the lord privy seal, if they are peers, are placed by 31 Hen. VIII. c. 10 before all dukes except dukes of the blood royal, and dukes of the blood royal are placed before the consanguinity specified in the act. And, since the holders of these offices have been and are always peers, their proper precedence if they are-commoners has never been determined.

In 1843, the Great Master of the Constables of Scotland, the Great Master of the Constable, the Marshal, the Lord Admiral, the Great Master or Lord Steward, and the King's Chamberlain shall sit and be placed after the Lord Privy Seal in manner and form following: that is to say, every one of them shall sit and be placed above all other personages being of the same estates or degrees that they shall happen to be of, that is to say, the Great Chamberlain first, the Constable next, the Marshal third, the Lord Admiral fourth, the Grand Master or Lord Steward fifth, and the King's Chamberlain sixth. The office of lord high steward of England, then under attainer, is not mentioned in the act for the placing of the Lords, "because it was intended," Lord Chief Justice Coke says, "that when the use of him was abhorrent, he should be removed from the precedence of the peers." (Inst. iv. 77). But it may be noted that, when his office is called out of abeyance for coronations or trials by the House of Lords, the lord high steward is the greatest of all the great officers of state in England. The office of the lord constable has been hereditary in the coheirs of the last duke of Ancaster, which inherited it from the De Veres, earls of Oxford, in whose line it had descended from the reign of Henry I. The office of lord high constable of England is the seniority degree; and the lord high steward, precedence being suspended coronations only. The office of earl marshal is hereditary in the Howards, dukes of Norfolk, premier earls and, as earls of Arundel, premier earls of England, under a grant in special tail male from the crown of England. The office of lord high treasurer, if the office of lord high treasurer, is practically exact as a dignity. Since the reign of Queen Anne there has been only one lord high admiral, namely, William, duke of Clarence, afterwards William IV., for a few years, in 1815, admiral, and the lord chamberlain of the household are always peers, and have seldom been under the degree of earls. We may here remark that both the Scottish and Irish Acts of Union make no reference to the precedence of the great officers of state of Scotland and Ireland. Not to mention the prince of Wales, who is by birth steward of Scotland, the earl of Shrewsbury is hereditary great seneschal of Ireland; the duke of Argyll is hereditary master of the household; the earl of Exeter is hereditary constable and marshal; and the lord high constable of Scotland has been placed next to the earl marshal of England, and, although no rank has been assigned on these occasions to the hereditary great seneschal of Ireland, the lord high constable of Scotland appointed for the ceremony has been at all or most of them placed next to the lord constable of Scotland. It is worthy of notice, however, that Sir George Mackenzie, writing when lord admiral of Scotland, lists the rank of the constable and marshal to take place as officers of the Crown but according to their creation as Earls, and he moreover expresses the opinion that "it seems very strange that these who ride upon the spheres, and are; who are by birth and by birth of high birth, and who guard the Parliament itself, and the Honours, should have no precedence by their offices." (Observations, &c., &c., p. 25, in Guillim's Display of Heraldry, p. 461 seq.; but see also Wood-Douglas, Peerage of Scotland, vol. i. 226). Hence it is that the earls are ranked after the dukes, because they are younger sons, whose rank is uncertain, whereas the eldest sons succeed to the dignity and rank of their fathers. The eldest sons of peers of any given degree are of the same rank as, and are to be placed immediately after, peers of the first degree under that of their fathers; and the younger sons of peers of any given degree are of the same rank as, and are to be placed after peers of the second degree and the eldest sons of peers of the first degree under that of their fathers.

The eldest sons of peers, if they are barons, precede all other barons under 31 Hen. VIII. c. 10. But if they are of any higher degree their rank is not influenced by their official position.

Under 1 Will. and Mary, c. 21, being the only commissioners for the execution of any office who have precedence assigned to them.

The officers of the household, under Henry VIII.'s warrant of 1540, precede the secretaries of state have been for a long time always ranked second in order to the lords of the admiralty, and usually far higher, than their official rank. The practical result is, in fact, that the great seal is only very rarely indeed in possession, that the secretaries of state, when they are commoners whose personal precedence is otherwise not significant, are ranked by the speaker of the House of Commons. The principal secretaries, for so they are all designated, are officially equal to one another in dignity, and are placed among themselves according to seniority.

During more than two centuries only one commissioner has been indebted for his precedence to his election into the order, and that was Sir Robert Walpole, the minister, who at the coronation of George III., was created a knighthood of the garter by the queen before privy councillors. The proper precedence of both knights of the Thistle and knights of St Patrick is undecided.

Privy councilors of Great Britain and of Ireland take precedence according to the dignity of their personages, and in precedence to admission. The chancellors of the exchequer and the archbishop of Canterbury are ranked after the dukes of Lancashire and after the privy councillors.
justice of England; (47) master of the rolls; (48) lords justices of appeal; (49) judges of the High Court of Justice; (50) knights bannermen made by the sovereign in person; (51) viscounts, viscount barons, and baronets, sons; (52) baronets' younger sons; (53) sons of lords of appeal; (54) baronets; (55) knights bannermen not made by the sovereign in person; (56) knights of the first class of the Bath, the Star of India, St Michael and St George; (57) the Indian Empire, the Royal Victorian Order; (58) knights of the second class of the Bath, the Star of India, St Michael and St George; (59) other orders K.C.I.E., & c.; (60) knights bachelors; (61) judges of county courts; (62) eldest sons of the younger sons of peers; (63) baronets' eldest sons; (64) knights' eldest sons; (65) baronets' younger sons; (66) knights' younger sons; of England, the master of the rolls, and the lords justices of appeal are always members of the privy council, and have rank and place as privy councillors, if they are not also peers.

1 The lords justices of appeal have precedence among themselves according to their respective appointments. Until recently they were preceded by the lord chief justice of the common pleas and the lord chief baron of the exchequer (divisions of the High Court of Justice). But under existing arrangements these offices have fallen into abeyance, and the order of precedence is not taken into consideration by the chancellors used to follow the lords justices of appeal; but, in spite of the fact that there is still one vice-chancellor remaining, the office of vice-chancellor is extinct and will altogether disappear on his death, no successor being appointed, as the office is no longer filled up. The judges holding these offices are invariably privy councillors, however, they are ranked accordingly. And it is the same with regard to the lord justices of appeal as to the masters of the rolls. The masters of the rolls are always included in the order of precedence among themselves, and they have their own rules for the time of their elections and the order of precedence among themselves, in order to be before the orders of chief justice of the common pleas and chief baron of the exchequer are suspended.

By warrants of the 30th of March 1868, although lords of appeal and hereditary barons in order of creation, their sons stand in a class by themselves.

4 It is a question whether baronets ought or ought not to have precedence, like peers, according as they are of England, Scotland, Great Britain, Ireland or the British Empire. In fact, whether the Scottish or the Irish Act of Union; and Sir Bernard Burke contends that, since the Acts of Union are silent with regard to them, they are still entitled to whatever precedence was originally conferred upon them. He is therefore of the opinion that the order of precedence among themselves is determined by the dates of their several creations, and in this he appears to have both law and reason on his side.

These knights consist of grand crosses of the first, grand crosses of the second, and grand crosses of the third order, and have precedence in their respective orders according to seniority of creation. By the statutes of the order of the Bath, as revised in 1847, it is ordained that the knights grand crosses are to be placed on the rank and precedence of baronets, and their successors of the next degree under that of their grandfathers. Sir Charles Young says that "by decision (Chap. Coll. Armes of 1860) if the eldest son of an earl died in his father's lifetime leaving a son and heir, such son and heir during the life of the earl his grandfather is (67) companions of the Bath, the Star of India, St Michael and St George and the Indian Empire; (68) members of the 4th class of the Royal Victorian Order; (69) companions of the Distinguished Service Order; (70) members of the 4th class of the Royal Victorian Order; (71) esquires; (72) gentlemen.

2. General Precedence of Women

The Queen: (1) queen dowager; (2) princess of Wales; (3) daughters of the sovereign; (4) wives of the sovereign's younger sons; (5) granddaughters of the sovereign; (6) wives of the sovereign's grandsons; (7) sisters of the sovereign; (8) wives of the sovereign's brothers; (9) aunts of the sovereign; (10) wives of the sovereign's uncles; (11) nieces of the sovereign; entitled to the same place and precedence as was due to his father; so had the father been summoned to parliament as the eldest son of a peer the grandson would succeed to the dignity even during the grandfather's lifetime "(Order of Precedence, p. 27). And, of course, the queen-consort and heir of an earl applies equally to the grandsons and heirs of dukes and marquesses. But the grandsons and heirs of viscounts and barons are differently situated, and have neither honorary additions to their names nor any ascendant support of any kind. Some of the eldest sons are in the order of precedence but not in the order of precedence of their own assigned to them. Similarly the eldest sons of the younger sons of peers and the eldest sons of baronets and of knights who are not esquires, have a particular precedence of their own assigned to them. All of them are placed before esquires as a specific grade in the scale of general precedence, and have precedence of all esquires. Thus, if a younger son of baronets and of knights who are not esquires, have a particular precedence of their own assigned to them. All of them are placed before esquires as a specific grade in the scale of general precedence, and have precedence of all esquires. The queen's eldest sons of peers, on the ground that under their statutes they are entitled to precede "all Esquires of the Realm." But the sons of peers themselves—the eldest as well as the younger sons, are placed not before any other persons who, whether they or are not esquires, have a definite and settled rank which is superior to that of the specific grade in the scale of general precedence.

10 It appears to be admitted on all hands that the following persons are esquires and ought to be so described in all legal documents and processes: first, the eldest sons of peers in the lifetime of their fathers, and the younger sons of peers both in and after the lifetime of their fathers; second, the eldest sons of baronets, and their younger sons; third, the eldest sons of baronets and of knights who are not esquires, have a particular precedence of their own assigned to them. All of them are placed before esquires as a specific grade in the scale of general precedence, and have precedence of all esquires. Thus, if a younger son of baronets and of knights who are not esquires, have a particular precedence of their own assigned to them. All of them are placed before esquires as a specific grade in the scale of general precedence, and have precedence of all esquires. The queen's eldest sons of peers, on the ground that under their statutes they are entitled to precede "all Esquires of the Realm." But the sons of peers themselves—the eldest as well as the younger sons, are placed not before any other persons who, whether they or are not esquires, have a definite and settled rank which is superior to that of the specific grade in the scale of general precedence.
(12) wives of the sovereign's nephews; (13) wives of princes of the blood royal; (14) duchesses; (15) wives of eldest sons of dukes of the blood royal; (16) marchionesses; (17) wives of the eldest sons of dukes; (18) dukes' daughters; (19) countesses; (20) wives of younger sons of dukes of the blood royal; (21) wives of the eldest sons of marquesses; (22) marquesses' daughters; (23) wives of the younger sons of dukes; (24) viscountesses; (25) wives of the eldest sons of earls; (26) earls' daughters; (27) wives of the younger sons of marquesses; (28) baronesses; (29) wives of the eldest sons of viscounts; (30) viscounts' daughters; (31) wives of the younger sons of earls; (32) wives of the eldest sons of barons; (33) barons' daughters; (34) maids of honour to the queen; (35) wives of knights of the Garter; (36) wives of knights baronets made by the sovereign in person; (37) wives of the younger sons of viscounts; (38) wives of the younger sons of baronets; (39) wives of knights baronets not made by the sovereign in person; (40) wives of knights of the Thistle; (41) wives of knights of St Patrick; (42) wives of knights grand cross of the Bath, grand commanders of the Star of India, and grand cross of St Michael and St George; (43) wives of knights commanders of the Bath, the Star of India, and St Michael and St George; (44) knights bachelors' wives; (45) wives of the eldest sons of the younger sons of peers; (47) daughters of the younger sons of peers; (48) wives of the eldest sons of baronets; (49) baronets' daughters; (50) wives of the younger sons of knights; (51) knights' daughters; (52) wives of the younger sons of baronets; (53) wives of the younger sons of knights; (54) wives of commanders of the Royal Victorian Order, companions of the Bath, the Star of India, St Michael and St George, and the Indian Empire; (55) wives of members of the 4th class Royal Victorian Order; (56) wives of esquires; (57) gentlewomen.

A special table of precedence in Scotland is regulated by a royal warrant dated the 16th of March 1905, and a special table of precedence in Ireland was set forth by authority of the Lord Lieutenant (Jan. 2, 1895). Both contain errors and will probably be revised.

Attention to the foregoing tables will show that general precedence is of different kinds as well as of several degrees. It is first either personal or official, and secondly either substantive or derivative. Personal precedence belongs to the royal family, the peerage and certain specified classes of the commonalty. Official precedence belongs to such of the dignitaries of the Church and such of the ministers of state and the household as have had rank and place accorded to them by parliament or the Crown, to the speaker of the House of Commons and to the members of the privy council and the judicature. Substantive precedence, which may be either personal or official, belongs to all those whose rank and place are enjoyed by them independently of their connexion with anybody else, as by the archbishop of Canterbury, the lord high chancellor or the lord great chamberlain, peers and peeresses, baronets, knights and some esquires. Derivative precedence, which can only be personal, belongs to all those whose rank and place are determined by their consanguinity with or affinity to somebody else, as the lineal descendants of baronets, sons and daughters-in-law of peers and peeresses in their own right, and the wives, sons, daughters and daughters-in-law of baronets, knights and some esquires.

Bearing the above definitions and explanations in mind, the following canons or rules may be found practically useful:

1. Anybody who is entitled to both personal and official precedence is to be placed according to that which implies the higher rank. If, for example, a baron and a baronet are both privy councillors, the precedence of the first is that of a baron and the precedence of the second is that of a privy councillor. And similarly, except as hereafter stated, with respect to the holders of two or more personal or two or more official dignities.

2. Save in the case of the sovereign, official rank can never supply the foundation for derivative rank. Hence the official precedence of a husband or father affords no indication of the peerage or higher rank of his wife or her children, for example, of the archbishop of Canterbury, the lord high chancellor or the speaker of the House of Commons do not participate in their official rank but only in their personal rank, whatever it may be.

3. Among subjects men alone can convey derivative rank, except in the case of the daughters and sisters of the sovereign, or of peeresses in their own right. But no man can acquire any rank or place by marriage. The sons-in-law or brothers-in-law of the sovereign and the husbands of peeresses in their own right have as such no precedence whatever. And the daughter and heiress of the premier duke of England, unless she happens to be also a peeress in her own right, does not transmit any rank or place to her children.

The limits of the peerage derivative rank is as a rule always merged in personal, as distinguished from official, substantive rank. If, for example, the younger son of a duke is created a baron or inherits a barony, his precedence ceases to be that of a duke's younger son and becomes that of a baron. But where the eldest son of a duke, a marquess or an earl is summoned to the House of Lords in a barony of his father's, or succeeds as or is created a baron, he is still, as before, "commonly called" by some superior title of peerage, as marquess, earl or viscount, and retains his derivative precedence on all occasions, except in parliament or at ceremonies which he attends in his character as a peer. The younger sons of all peers, however, who are created or who inherit peerages—which they often do under special limitations—are everywhere placed according to their substantive rank, no matter how inferior it may be to their derivative rank. But if the son of a duke or
marquess, whether eldest or younger, or the eldest son of an earl is consecrated a bishop his derivative rank is not merged in his substantive rank, because it is official, and his derivative and personal rank implies the higher precedence. Again, the daughters of dukes, marquesses and earls who become peeresses by marriage or creation, or who inherit as peeresses, are placed according to their substantive and not according to their derivative rank, although they may thereby be assigned a far lower precedence than that to which their birth entitles them.

5. The widows of peers and baronets have precedence immediately before the wives or widows of the next successors in their husbands' dignities. But the sons and daughters of peers and baronets have precedence immediately before the sons and daughters of the holders of the dignities to whom their fathers succeeded. The reason of this is that the first are senior in the dignities and the second are nearer in the line of succession to them.

6. The widows of peers who marry again either share the precedence of their second husbands or resume the precedence belonging to them independently of their marriage with their first husbands. Thus, if the daughter of a duke or an esquire marries first an earl and secondly a baron, although she remains a peeress, she is placed as a baroness instead of a countess. But if either of them should marry a commoner as her second husband, whatever may be his rank or degree, she should be a peeress. While, however, the duke's daughter, if her second husband were not the eldest son of a duke, would resume her precedence as the daughter of a duke, the esquire's daughter would share the precedence of her second husband, whether he were a peer's son, a baronet, a knight or an esquire. The widows of peers have long kept their former rank in society, but they have no such right unless by permission of the sovereign, which permission has on several recent occasions been refused.

7. The widows of the eldest and younger sons of dukes and marquesses and of the eldest sons of earls, and also the widows of baronets and knights who marry again, are permitted by the etiquette of society to keep the titles and rank acquired by their first marriage if their second marriage is with a commoner whose precedence is considerably lower. But the widows of the younger sons of earls and of the eldest and younger sons of viscounts and barons, although their precedence is higher than that of the widows of baronets and knights, are not allowed to retain it, under any circumstances, after a second marriage.

8. Marriage does not affect the precedence of peeresses in their own right unless their husbands are peers whose peerages are of a higher degree, or, being of the same degree, are of more ancient creation than their own. If, for example, a baroness in her own right marries a viscount she is placed and described as a viscountess, or if she marries a baron whose barony is older than hers she is placed in his precedence and described by his title. But if she marries a baron whose barony is junior to hers she keeps her own precedence and title.

9. The daughters of peers, sons of peers, baronets and knights retain after marriage the precedence they derive from their fathers, unless they marry peers of any rank or commoners of higher rank than their own. Hence, for example, the daughter of a duke who marries the eldest son of a marquess is placed as a duke's daughter, not as the wife of a marquess's eldest son, and the daughter of a baronet who marries the younger son of a knight is placed as a baronet's daughter and not as the wife of a knight's younger son.

10. What are termed "titles of courtesy" are borne by all the sons and daughters of peers and peeresses in their own right, who in this connexion stand on exactly the same footing. The eldest sons of dukes, marquesses and earls are designated by the names of one or other of the inferior peerages of their fathers; usually a marquessate or an earldom in the first, an earldom or a viscounty in the second and a viscounty or barony in the third case. The rule applicable in former times, still adhered to by the older English dignities, was that a duke's eldest son was styled earl, the son of a marquess, viscount, the son of an earl, baron. No such rule obtained in Scotland. But, whatever it may be, it is altogether without effect on the rank and place of the heir, which are those belonging to him as the eldest son of his father. The younger sons of dukes and marquesses are styled "lords," followed by both their Christian names and surnames. The younger sons of earls and both the eldest and the younger sons of viscounts and barons are described as "honourable" before both their Christian names and surnames. The daughters of dukes, marquesses and earls are styled "ladies" before both their Christian names and surnames. The daughters of viscounts and barons are described as "honourable" before both their Christian names and surnames. If the eldest son of a marquess or an earl marries a woman of rank equal or inferior to his own, she takes his title and precedence; but if she is of superior rank she retains, with her own precedence, the prefix "lady" before her Christian name followed by the name of her husband's title of courtesy. Again, if the younger son of a duke or a marquess marries a woman of rank equal or inferior to his own, she is called "lady," with his Christian and surname following, and is placed in his precedence, but, if she is of superior rank, she retains, with her own precedence, the prefix "lady" before her Christian name and his surname. If the daughter of a duke, a marquess or an earl marries the younger son of an earl, the eldest or younger son of a viscount or baron, a viscount or baron, or a knight, she takes his surname, with her own precedence, the prefix "lady" before her Christian name and her husband's surname. If the daughter of a viscount marries the younger son of an earl or anybody of inferior rank to him, or the daughter of a baron marries the younger son of a viscount or anybody of inferior rank to him, she retains her own precedence with the prefix "honourable" before the addition "Mrs" and his surname or Christian name and surname. But, if her husband is a baronet or a knight, she is called the Honourable Lady Smith or the Honourable Lady Jones, as the case may be. The wives of the younger sons of earls and of the eldest and younger sons of viscounts and barons, if they are of inferior rank to their husbands, take their precedence and are described as the Honourable Mrs, with the surnames or Christian names and surnames of their husbands following. The Judges were placed by James I. before the younger sons of viscounts and barons and accorded the title of "honourable" (q.v.). But in this addition their wives do not participate, since it is merely an official distinction.

It is manifest on even a cursory examination of the tables we have given that, although they embody the only scheme of general precedence under the Crown, wherein various public functionaries walk and have for the occasion certain places assigned to them, but which they may not at all times find the same, as it by no means follows that they are always entitled to the same place for life; that there is to a certain extent precedence furnished thereby, and in some cases the uniformity of precedence in regard to one class over another has in such cases become established. This applies, for instance, to the places of the Gentlemen of the Bedchamber and Master of the Horse, the Masters of the Ordnance and Six Clerks in Chancery, who have no definite or fixed place in the tables of precedence regulating the general orders of society, though in reference to State ceremonies they have certain places assigned in the order of procession in right of their offices, which, however, give them no general rank. Upon such occasions, nevertheless, the legal rank and precedence which they hold in the Courts of Law is observed, and so far establishes among themselves, and in respect to their several classes, their precedence " (Sir Charles Young, Order of Precedence, &c., pp. 59-60).
the scale of general precedence for men. If, indeed, it includes the queen’s maids of honour and the wives of the companions of the knightly orders, there certainly does not seem to be any good reason why it should omit the mistress of the robes and the ladies of the bedchamber, or the ladies of the royal order of Victoria and Albert and the imperial order of the Crown of India. But these are trifling matters in themselves, and concern only a minute fraction of the community. The scale of general precedence for men is now in substantially the same condition as that in which it has been for between two and three centuries, and the political, to say nothing of the social, arrangements to which it was framed to apply have in the interval undergone an almost complete transformation. The consequence is that a good deal of it has come down to us in the shape of a survival, and has ceased to be of any practical use for the purpose it was originally designed to effect. While it comprises several official and personal dignities which are virtually obsolete and extinguished, it entirely omits the great majority of the members of Government in its existing form, and whole sections of society on a less exalted level, to whom it is universally felt that some rank and place at all events are both in public and in private justly due. And, when it does confess the presence of any of the sovereign’s principal ministers, it commonly places them in positions which are out of all keeping with their actual eminence and importance. It ranks the lord president of the council and the lord privy seal before dukes, while it places the chancellor of the exchequer after the younger sons of earls and the eldest sons of barons, and the secretaries of state after the master of the horse and the vice-chamberlain of the household. The lord chancellor still has precedence as the first of the great officers of state, which was allotted to him not as what he is, the head of the judicature, but as what he once was, the prime minister of the sovereign; and the lord chief justice, who is next to him in regular judicial rank, as presiding over the common law courts, as he presides over the courts of equity, is placed after the chancellors of the exchequer and of the duchy of Lancaster, who still have the precedence which was allotted to them not as ministers, which they are, but as judges, which they are no longer. Neither the lord-lieutenant of Ireland, the viceroy of India, nor the governor-general of Canada has any rank or place at St James’s, where, as well as at Westminster, the lord steward or the lord chamberlain of the household is a much greater and more splendid personage. Again, in the scale of general precedence there are no clergymen except bishops, no lawyers except judges, and no officers of either the army or the navy from field marshals and admirals of the fleet downwards. Nor, of course, are any colonial governors or lieutenant-governors entered on it. It contains no mention of under-secretaries of state, chairmen or commissioners of administrative boards, comptrollers or secretaries of government departments, lordlieutenants or sheriffs of counties, deputy lieutenants or justices of the peace, members of the House of Commons or graduates of the universities. It is true that among some of these classes departmental appointments hold precedence over the persons holding appointments in the East Indies. In order to fix the same, and prevent all disputes, We do hereby declare that it is Our will and pleasure that the following Table be observed with respect to the Rank and Precedence of the personages therein mentioned.

** Governer-General and Viceroy of India.**

** Governor of Madras.**

** Governor of Bombay.**

President of the Council of the Governor-General, Lieutenant-Governor of Bengal. Lieutenant-Governor of North-Western Provinces. Lieutenant-Governor of the Punjab. Commander-in-Chief in India, when a Member of Council. Chief Justice of Bengal. Bishop of Calcutta, Metropolitan of India. Chief Justices of Madras, Bombay and North-Western Provinces. Commanders-in-Chief in Madras and Bombay, when also Members of Council. Commanders-in-Chief of the Provinces of Bombay and Madras.

** Governor-General, Bishops of Madras and Bombay.**

** Ordinary Members of Council in Madras and Bombay.**

** Commander-in-Chief in India, when not a Member of Council.**

** Judges of the High Courts of Calcutta, Madras, Bombay and North-Western Provinces.**

** Commanders-in-Chief, Madras and Bombay, when not Members of Council.**

** Chief Commissioners and Resident at Hyderabad.**

** Military Officers above rank of Major-General.**

** Additional Members of the Council of the Governor-General when assembled to make laws.**

** Commodore commanding Her Majesty’s Naval Forces in India.**

** Judge Advocate General of India.**

** Secretaries to the Government of India.**

** Additional Members of the Council of the Governor-General when assembled to make laws.**

** Members of the Legislative Council of the Lieutenant-Governor of Bengal.**

** Agents to the Governor-General in Rajputana and Central India.**

** Commissioner in Sind. Judges of the Chief Court, Punjab.**

** Chief Secretaries to the Governments of Madras and Bombay.**

** FIRST CLASS**

Civilians of 28 years’ standing to rank with Major-Generals.

** Valuation of postage stamps.**

** Financial Commissioners in the Punjab, Oude and Central Provinces.**

** Archdeacon of Calcutta.**

** Secretary to Council of Governor-General for making Laws.**

** Officers Commanding Brigades.**

---

1 This subject was considered by the House of Lords in February 1628, on the proposition of a committee that no foreign nobility has right of precedence within this realm before any peer of this kingdom.
SECOND CLASS

Civilians of 20 years' standing ranking with Colonels.

THIRD CLASS

FOURTH CLASS

Civilians of 8 years' standing ranking with Majors. Assistant Political Agents. Officers, 2nd Grade, Geological Survey. Officers, 3rd Grade, Education Department. Officers, 3rd Grade, Financial Department. Superintendents, 2nd Grade, Telegraph Department. Government Solicitors.

FIFTH CLASS

Civilians of 4 years' standing ranking with Captains. Junior Chaplains. Officers, 4th Grade, Education Department.

SIXTH CLASS

Civilians of less than 4 years' standing to rank with Subalterns.

Note 1.—Commissioners of Divisions within their own Divisions, and Assistants and Political Agents with the limits of their respective charges, to take precedence immediately before Civilians of the 1st Class.

Note 2.—Collectors and Magistrates of Districts, and Deputy Collectors of Districts, and the Chief of each Office in Presidency Municipalities, to take precedence within their respective charges before the 3rd Class and Lieutenant-Colonels in the Army. Sheriffs to rank within their charges immediately after Lieutenant-Colonels in the Army.

All Officers not mentioned in the above table, whose rank is regulated by comparison with rank in the Army, have the same rank with reference to Civil Servants as is enjoyed by Military Officers of equal grades.

All persons who may not be mentioned in this table to take rank according to general usage, which is to be explained and determined by the Governor-General in Council in case any question shall arise.

Nothing in the foregoing rules to disturb the existing practice relating to precedence at Native Courts, or on occasions of intercourse with Natives, and the Governor-General in Council to be empowered to make rules for such occasions in case any dispute shall arise.

All ladies to take place according to the rank herein assigned to their respective husbands, with the exception of wives of Peers, and of ladies having precedence in England, independently of their husbands, and who are not in rank below the daughters of Barons; such ladies to take place according to their several ranks, with reference to such precedence in England, immediately after the wives of Members of Council at the Presidencies in India.

Given at Our Court at Windsor, this sixth day of May, in the year of our Lord one thousand eight hundred and seventy-one, and in the thirty-fourth year of our Reign.

By Her Majesty's Command.
(Signed) ARGYLL. (F. Dr.; W. A. L.)

PRECENTOR—PRECESSION OF THE EQUINOXES

PRECENTOR (Late Lat. præcentor, from praecipere, to sing before, lead in singing), the title of the principal director of the singing or musical portions of the service in a cathedral or cathedral church. In the English Church in cathedrals of the "Old Foundation" the precentor is a member of the cathedral chapter and officially ranks next to the dean. His musical duties are usually performed by the "successor," one of the vicars choral. In cathedrals of the "New Foundation" the "precentor" is not a member of the chapter, but is one of the minor canons.

PRECEPT (Lat. praecipium, a rule, from praecipere, literally to take beforehand, to give rules, instructions or orders), a command or rule, especially one with regard to conduct or action, a moral rule or injunction, a maxim. Apart from this general use, the word was used, in law, of many orders in writing issuing from a court or other legal authority; it is now chiefly used of an order demanding the payment of money under a rate by poor law or other local authorities (see RATE). The Latin form praecipe, i.e. enjoin, command, is used of the note of instructions delivered by a plaintiff or his solicitor to be filed by the officer of the court, giving the name of the plaintiff and defendant, the nature of the writ, &c. For the obsolete writ of praecipe quand redat see Writt.

PRECEPTOR, a teacher or instructor, the classical meaning of the Latin præceptor, from praecipere, literally to take in advance, hence to give rules or "precepts," advise, teach. As an educational term in English the word is familiar through the College of Preceptors, a chartered society chiefly composed of private teachers; it was incorporated in 1849 and was one of the first professional bodies to institute regular courses of pedagogic lectures and to award after examination the titles of licentiate and associate to teachers. It also holds examinations for pupils. In post-classical Latin præceptor meant a commander, praecipere, to order, enjoin, and the term was adopted by the Knights Templars for the heads of the provincial communities of knights established on their estates. These communities and the estates themselves were known as "preceptories," and answered to the "commanderies" of the Hospitallers.

PRECESSION OF THE EQUINOXES, in astronomy, the term assigned to the progressive motion of the equinox, because it takes place in a direction from east towards west, opposite to that in which planets move, and in which longitudes are measured. The equinox being defined as the point of intersection of the equator and ecliptic, its motion arises from the fact that both of these great circles are in continuous though slow motion. The motion of the ecliptic is due to the action of the planets on the earth, which produces a slow progressive change in the position of the plane of the earth's orbit, and therefore of the ecliptic. This motion takes place round a diameter of the celestial sphere as an axis or nodal line, which intersects the sphere in two points, which are at present in longitudes about 173° and 335°. The direction of the motion around this axis is such that from the limits 355° through o° to 173°, which includes the vernal equinox, the motion is towards the south, whereas from the limits 173° to 335°, which includes the autumnal equinox, the motion is towards the north. At the present time the rate of the motion is 54.7" per century. In consequence of the smallness of the angle, 79°, which the axis of motion makes with the line of the equinoctial, its effect on the precession is quite small, now amounting to only 0.14" per annum. Owing to its cause this small part of the precession is called "planetary."

The motion of the equator is due to the combined action of the sun and moon on the equatorial protuberance of the earth (see Astronomy). Owing to its cause this largest part of the precession is called "juni-solar." Its fundamental law is that the mean celestial pole at each instant (see NUTATION) moves at right angles to the circle joining it to the pole of the ecliptic as that instant. Hence if the pole of the ecliptic were fixed, the celestial pole would revolve around it in a circle at a constant distance equal to the obliquity of the ecliptic. Owing, however, to the slow change in the position of the pole of the ecliptic, the motion is only approximately in a circle, and the obliquity
varies slowly from century to century. At the present time the rate of motion measured on a great circle is about 20" per year; that is to say both the pole and the plane of the equator move through this angle annually. But when measured around the pole of the ecliptic as a centre the motion is about 2.5 times this or, at present, 50-37" annually. This is the present amount of the luni-solar precession, if it remained constant, would carry the pole completely round in a period of 25,730 years. But the exact period varies slightly, owing to the motion of the pole of the ecliptic. The combined effect of the luni-solar and planetary precession or the total motion of the equinox is called the general precession. Its annual amount during our time is 50-259+0-02220" T, being the time reckoned from 1000 in centuries.

**PRECESSION** (from Lat. praecingere, to encircle, enclose, surround, prae, and cingere, to gird), an enclosure, a space within the boundaries, marked by walls or fences or by an imaginary line, of a building or group of buildings, especially used of such a space belonging to a cathedral or other religious building. The word is frequently used, indefinitely, of the neighbourhood or environs of a place or building. In the United States of America it is applied to various minor territorial divisions or districts, for electoral or judicial purposes. In some of the states they correspond to the "towship" as the principal subdivision of the "county."

**PRECIOUS** (O. Fr. précieux, mod. précieux, Lat. præciosus, of high value or price, preium), costly or of high value, particularly used in political economy of those metals which are "value enough to be used as a standard of value and abundant enough for coinage" (The Century Dictionary). The term is thus practically confined to gold and silver. Platinum in theory may be included as it was used for coinage in Russia in 1828; the fluctuations in the value of the metal caused its discontinuance in 1845 (see Gold, Silver and Money). "Precious stones" include those gems which are valued for ornament and jewelry. "Strictly speaking the only precious stones are the diamond, ruby, sapphire and emerald, though the term is often extended to the opal, notwithstanding its lack of hardness, and to the pearl ... strictly an animal product," G. F. Kunz, Gems and Precious Stones of North America (1890) (see Gem, and Lapidary and Gem-Cutting). A particular use of "precious" as meaning fastidious, over-refined, is taken from the French précieux, familiar in the appellation of Les Précieuses, given to the social and literary circle of ladies which centred round the Hôtel de Ramouillet in the 17th century (see Ramouillet; Catherine de Vivenne, Marquise de).

**PRECONIZATION** (Late Lat. preconizatio, from praeconeorare, to proclaim, Lat. præco, a public crier), a public proclamation or announcement. In this sense it is practically obsolete; but the word is still technically used of the solemn proclamation of new bishops, and of the sees to which they are appointed, made by the pope in the consistories of cardinals (see Bishop). In the English ecclesiastical courts "preconize" is also still used in the sense of "to summon by name."

**PREDELLA**, the Italian word for a footstool or kneeling-stool, hence applied to the step or platform on which an altar rests, and to a shelf raised above the altar at the back, a superaltar or gradino. The face both of the step and shelf are frequently decorated with sculpture or painting, and the term "predella" is frequently given to the sculpture or painting so used, and, further, to any painting that is a pendant to a larger work.

**PREDESTINATION** (from Lat. praedestinare, to determine beforehand; from the root sta, as in stare, stand), a theological term used in three senses: (1) God's unchangeable decision from eternity of all that is to be; (2) God's destination of men to everlasting happiness or misery; (3) God's appointment unto life or "election" (the appointment unto death being called "reprobation," and the term "foreordination" being preferred to "predestination" in regard to it). In the first sense the conception is similar to that of fate; this assumes a moral character as nemesis, or the inevitable penalty of transgression.

Sophocles represents man's life as woven with a "shuttle of adamant." (Antigone, 622-624). Stoicism formulated a doctrine of providence or necessity. Epicurus denies a divine superintendence of human affairs. A powerful influence in Scandinavian religion was exercised by the belief in "the norrin, or Fates, usually thought of as three sisters." In Brahminic thought Karma, the consequences of action, necessitates rebirth in a lower or higher mode of existence, according to guilt or merit. With some modifications this conception is taken over by Buddhism. The Chinese tao, the order of heaven, which should be the order for earth as well, may also be compared. According to Josephus (Antig. xvii. 1, 3, 4; xiii. 5, 9) the Sadducees denied fate altogether, and placed good and evil wholly in man's choice; the Pharisees, while recognizing man's freedom, laid emphasis on fate; the Essenes insisted on an absolute fate. This statement is exposed to the suspicion of attempting to assimilate to a Jewish sects to the Greeks by a process of later refinement. The orthodox theology teaches an absolute predestination, yet some teachers hold man responsible for the moral character of his acts. The freethinking school of the Mo'tazilites insisted that the righteousness of God in rewarding or punishing men for their actions could be vindicated only by the recognition of human freedom.

The theology of the relation of divine and human will has been the subject of two controversies in the Christian church, the Augustinian-Pelagian and the Calvinistic-Arminian. Pelagius maintained the free-will of man, and held that man's conduct, character, destiny are in his own hand. Grace, by enlightening, fortifying sin and strengthening his moral powers, helps him to fulfill this purpose. While grace is meant for all, men make themselves worthy of it by striving after virtue. This doctrine as minimizing grace was repugnant to Augustine. He regarded mankind as sinful, guileful, remain, incapable of any good. God alone can save. His grace is effectual and irresistible. As what God has done He has eternally willed to do, grace involves predestination. God has from eternity chosen those whom He wills to predestination, and election. In later times, things are passed over to others whom He leaves to perish ("praeterritio"). As all deserve damnation, there is no injustice in leaving them to their deserts. The reparation "of the wicked is not the cause of their sin; man's preknowledge or foreknowledge of his own sin and the consequences thereof are not, in a general way, the cause of predestination and foreknowledge are related is made plain.

The doctrine of Augustine was revived in the 19th century by Grotschalk, who taught that God's passing over the lost meant that of predestination. No such teaching, however, was noticed. This dispute would have little interest now, had not Hinnam appealed to John Scotus Eriugena, who attempted to solve the theological problem of free will and moral freedom, which he made derived from God's foreknowledge and predestination as temporal relations could be properly predicated of God as eternal; he described sin and its consequences as negatives, neither caused by nor known to God; he maintained that as evil as well as good is a real part of the world, and as such is destined to be a universal return to God. Thus the doctrine of predestination was emptied of meaning. This defense of orthodoxy was condemned as heretical. The controversy was kept up during the subsequent centuries. Thomas Aquinas followed Augustine. Duns Scotus leaned toward Semi-Pelagianism, which rejected the doctrine of predestination, and maintained a co-operation of freedom and grace. While Aquinas affirmed the positions of Augustine, he declared they were "first mover, itself unmoved." His original contribution to the subject was his theory of divine concurrence. He distinguished secondary cause as natural and necessary, and as voluntary and contingent; thought of men, are not only foreknown by God, but the natural cause to remain natural, so do the voluntary remain voluntary. But this is clearly only a verbal solution.

At the Reformation the Augustinian position was accepted by both Luther and Calvin. Melanchthon modified his earlier view in the direction of synergism, the theory of a co-operation of divine grace and human freedom. The later Lutheran doctrine is "that man, unable as he is to will any good thing, can yet use the means of grace, and that these means of grace turn not themselves into a divine power, produce a saving effect on all who do not voluntarily oppose their influence. Baptism, e.g. confers graces, which if not resisted is saving. And God, foreseeing who will not be saved, from whom he can do nothing, foreknows others to be saved with some and leave others to perish." The latter view was held by Beza and other Calvinists, and, it is said, repelled Arminians from
Calvinism, and led him to formulate the doctrine that as repentance and faith are divinely decreed conditions of eternal life, God has determined to give that life to all whom He foresees as fulfilling these conditions. According to Calvinism God's election unto salvation is without reservation which is inculcated in the New Testament and according to Arminianism it is conditional, dependent on man's use of grace. The Synod of Dort (1618-1619) which affirmed the sublapsarian without excluding the supralapsarian form of Calvinism, an explicit denial of Arminianism was made. The latter was known as Remonstrants from the remonstrance which in four articles recapitulates supralapsarianism and infralapsarianism (which regarded the fall as foreseen, but not decreed), and the doctrines of irresistible grace, predestination and unconditional election of the elect finally falling away from it, and boldly asserts the universality of grace. In the Church of Rome the Dominicans favoured Augustinianism, the Jesuits Semi-Pelagianism; the work of Molina on the agreement of free foreknowledge with grace has been invoked by other theologians as shown by the pope silenced without deciding: but which broke out again a generation later when Jansen tried to revive the declining Augs

The church of England has passed through several disputes regarding the question whether the Thirty-Nine Articles are Calvinistic or not; while there is some ambiguity in the language, it seems to favour Calvinism. At the Evangelical Revival the old questions came up, as Wesley favoured Arminianism and George Whitefield the opposite. In Scotland Calvinism was repudiated by James Morison, the founder of the Evangelical Union, who declared the three universals, God's love for all, Christ's death for all, the Holy Spirit's working for all.

While retained in the creeds of several denominations, in the public teaching of the churches the doctrine of predestination has lost its place and power. While the doctrine of election magnified God's grace, and so encouraged humility in man, it minimized man's freedom, and so produced either an over-confidence in those who believed themselves elect, or despair in those who thought themselves non-elect. Now it is recognized that God's sovereignty must be conceived as consistent with man's liberty. While God fulfils His all-embracing purpose, that fulfillment leaves room for the exercise of individual freedom; the freedom God has bestowed on man He can so restrain and direct as to overrule even its abuse for His own gracious ends. That God desires that all should be saved, and that the salvation of each depends on his own choice—these are the general convictions of modern theology. The problem now is the reconciliation of human freedom with divine foreknowledge. Martineau accepts Dugald Stewart's solution. "There is no absurdity in supposing that the deity may, for wise purposes, have chosen to open a source of contingency in the voluntary actions of his creatures, to which no prescience can possibly extend. Others hold the problem to be insoluble, and not needing to be solved. (A. & A.)"

**PREDICABLES** (Lat. prædicabilis, that which may be stated or affirmed), in scholastic logic, a term applied to a classification of the possible relations in which a predicate may stand to its subject. The list given by the schoolmen and generally adopted by modern logicians is based on the original fivefold classification given by Aristotle (Topics, a. i. 101 b. 17-22): (1) definition (D), genus (γένος), differentia (διαφορά), property (πρωτότοκος), accident (αναπτυξία). The scholastic classification, obtained from Boetius' Latin version of Porphyry's Eiseage, modified Aristotle's by substituting species (εἰςδος) for definition. Both classifications are of universals, concepts or general terms, proper names of course being excluded. There is, however, a radical difference between the two systems. The standpoint of the Aristotelian classification is the predication of one universal concerning another. The Porphyrian, by introducing species (εἰςδος) as well as predicates, makes possible a classification of the universal concerning individuals (or species is necessarily predicated of the individual), and thus created difficulties from which the Aristotelian is free (see below).

The Aristotelian classification may be briefly explained: (1) The Definition of anything is the statement of its essence (Arist. τὸ ἐστίν ἀληθεύω), i.e. that which makes it what it is: e.g. "a triangle is a three-sided rectilinear figure." (2) Genus is that part of the essence which is also predicable of other things different from it in kind. A triangle is a rectilinear figure; i.e. in fixing the genus of a thing, we subsume it under a higher universal, of which it is a species. (3) Differentia is that part of the essence which distinguishes one species from another. As compared with quadrilaterals, hexagons, &c., all of which are rectilinear figures, a triangle is differentiated as having three sides. (4) A Property is an attribute which is common to all the members of a class, but is not part of its essence (i.e. need not be given in its definition). The fact that the interior angles of all triangles are equal to two right angles is not part of the definition, but is universally true. (5) A Species is a class of things which may or may not belong to a subject. The colour of the human hair is an accident, for it belongs in no way to the essence of humanity.

This classification, though it is of high value in the clearing up of the various modes of predication, is defective. In the first place, the relation of genus, differentia and definition and so forth, is of more significance in connexion with abstract sciences, especially mathematics, than for the physical sciences. It is superior on the face of it to the modern logic. Secondly it is said by some that such a classification has been said it classifies universals as predicates of individuals and thus involves the difficulties which gave rise to the controversy between realism and nominalism (q.v.). How are we to distinguish species from genus? Napoleon was a Frenchman, a man, an animal. In the second place how do we distinguish property and accident? Many so-called accidents are predictable necessarily of any particular persons. This difficulty gave rise to the distinction of separable and inseparable accidents, which is one of considerable difficulty.

See the modern logic textbooks.

**PREDICAMENT**, now used only in the sense of a dangerous or unpleasant position or situation. It meant properly that which is "predicated" or affirmed (Lat. prædicare) of anything, in logic, one of the ten Aristotelian categories (see Category), and so any definite state or condition. The use of "predicament" in the sense of "bad predicament," without the limiting adjective, is paralleled by "plight," "for bad plight," "success" for "good success."

**PREDICATION** (from Lat. prædicare, to state, assert), in logic, the term which denotes the joining of a predicate to a subject in a judgment or proposition. The statement "all men are mortal" is a predication, in which the subject "men" is in one way, the predicate "mortal" in another way. In other words a judgment is made up of a subject and a predicate joined by a copula. The true unit of thought is the judgment, since all concepts or universals exist only in continuous thinking (judging), the theory of predication is a fundamental part of logic. The true relation of subject and predicate has not been determined with unanimity, various logicians emphasizing different aspects of the process (see Logic). The logical use of "predicate" is to be distinguished from the grammatical, which includes the verb, whether it be the verb "to be" in its various forms, or another verb. The simple grammatical sentence "he strokes the dog" the first word is the subject, while "strokes the dog" is the predicate, including verb and object. In logic every proposition is reducible to the form "A is B," "B" being the predicate. Thus the logical form of "he strokes the dog" would be "he is the dog" or some other paraphrase which liberates and determines the logical predicate. The essence of the judgement which is denoted. It cannot be described simply as a third (i.e. separate part) of the judgment, because until two terms are enjoined by it they are not subject and predicate. Much discussion has raged round the question whether the use of the verb "to be" as the copula implies that existence is predicated by the subject. It may be taken as generally agreed that this is not the case (see further Logic, and the textbooks).

**PRE-EXISTENCE, DOCTRINE OF**, in theology, the doctrine that Jesus Christ had a human soul which existed before the creation of the world—the first and most perfect of created things—and subsisted, prior to His human birth, in union with the Second Person of the Godhead. It was this human soul which suffered the pain and sorrow described in the Gospels. The chief exposition of this doctrine is that of Dr Watts (Works, v. 274, &c.); it has received little support. In a wider form the doctrine has been applied to man in general—namely, that in the beginning of Creation God created the soul of all men which were subsequently as a punishment for ill-doing incarnated in physical bodies till discipline should render them fit for spiritual existence. Supporters of this doctrine, the Pre-existants or Pre-existiani, are found as early as the 2nd century, among
PREFACE—PREL

them being Justin Martyr and Origen (q.v.), and the idea not only belongs to metempsychosis and mysticism generally, but is widely prevalent in Oriental thought. It was condemned by the Council of Constantinople in 540, but has frequently reappeared in modern thought (cf. Wordsworth's *Intimations of Immortality*) being in fact the natural correlative of a belief in immortality.

**PREFACE** (Med. Lat. *praefatio*, for classical *praefatio*, *praefari*, to speak beforehand), an introduction to a book, also any preliminary or introductory statement. In liturgical use the term is applied to that portion of the Eucharistic service which immediately precedes the canon or central portion; the *preface*, which begins at the words *Vere dignum*, "It is very meet, right, &c.," is ushered in, in all liturgies, with the *Suscipere Corda*, "Lift up your hearts," and ends with the *Sanctus*, "Holy, Holy, Holy, &c." In the Western liturgies proper prefaces are prepared for particular occasions (see *LITURGY*).

**PREFECT** (prefet, in France, the title of a high official. The prefects of the department were created by a law of the 28th Pluviôse (Feb. 18) of the year VIII. (1790). The law of the 10th of August 1871, to be the chief organs of internal administration, and have, in fact, discharged this function, especially under the First and Second Empire, surviving, though with diminished importance, under the other forms of government which modern France has seen. In comparison with other French officials, they are well paid (the salary nowadays ranges from 39,000 to 18,000 francs according to the class).

In the administration of the ancien régime the term "prefect" was employed; practically the only case in which it occurs was in the organization of the establishment of institutions opened by the religious orders, in which there was generally a "prefect of the studies" (prefet des études). In the year VIII., in the discussion of the law of the 28th Pluviôse, no reason was stated for the choice of this term. But like the Tribunes and Consuls of the constitution of the year VIII., it was taken from the Roman institutions where they were the fashionable (sustainable). It may also be recalled that Voltaire had used the term "prefecture" in speaking of the authority of Louis XIV. over the free towns of Alsace.

The prefect has to a certain extent a double character and two series of functions. Firstly he is the general representative of the department, whose duty is to ensure execution of the government's decrees, as well as the direction of all branches of the public service in the department. In so far the rôle of the prefect is essentially political; he guarantees the direct and legal action of the government in his department. He has the supervision of all the services in his department, which procures the necessary uniformity in the working of the services, each of which is specialized within a narrow sphere. He serves as a local source of information to the government, and transmits to it the criticisms and complaints of his department's arrangements. In the name of the state he exercises a certain administrative control over the local authorities, such as the conseil général, the mayors and the municipal councils. This control, though not one of power, is of the greatest importance, and it is also exercised over the subprefects, who are those from whom he received his appointment. The prefect has the complete right to make regulations (règlements) both on special points, in virtue of various laws, and for the general administration of the police.

When prefects were created in the year VIII. the intendants of provinces of the ancien régime were taken as a model, and there is a great resemblance between their respective functions. The prefect, however, is no more an intendant in miniature, being only at the head of a department, whereas the intendant was chief of a province. The one was a much larger district than the other. In the same way the sous-prefets correspond to the subdélégués of the intendants, with the difference that they are actual officials subordinate to the prefects, while the subdélégués were merely the representative of the departmental intendants. The duty of the prefect is to establish this respect which has been reduced under the third Republic. This has chiefly been the effect of the law of the 10th of August 1871, which has led to decentralization, by increasing the powers of the conseils généraux. The law created a departmental committee (comité départemental) by which, in the interval of the sessions of the latter, takes part in matters concerning the administration of the departmental interests, either in virtue of the law, or by a delegation of powers from the conseil général.

The sous-prefets, having very limited powers of deciding questions, serve above all as intermediaries between the prefect and the persons under his administration. This function was most useful to them in the days of the First Empire, when communications were difficult, or even impossible, in a department, but nowadays it only leads to complications. As a matter of fact their chief service to the administration lies in keeping up good relations with the maires of the communes of the department, and the sous-prefects are frequently the only officials who have any influence over them. The National Assembly, which passed the law of the 10th of August 1871, had also decided to suppress the sous-prefets, but M. Thiers, who was then president of the Republic, persuaded them to consider this decision. Since then the Chamber of Deputies has on several occasions taken advantage of the budget to attempt the suppression of the sous-prefets by refusing to vote the money necessary for the payment of their salaries. But the government has always opposed this unconstitutional measure, holding that the suppression could only be done by an organic law, and that it would necessarily involve a remodelling of the administrative organization. So far their view has prevailed in the Chambers.

**PREHNITE**, a mineral consisting of calcium hydrogen orthosilicate, \(\text{H}_2\text{Ca}_2\text{Al}_2\text{Si}_6\text{O}_{18}\). It crystallizes in the hemimorphic class of the orthorhombic system, but the hemimorphic character is only observed when the crystals are generally platy in habit, but they rarely occur singly and are often shaped like a globular, or in a crystalline aggregate. They are generally found in a strata or as an accessory mineral in various rocks, including granite, gneiss, and in the formations of the Lake Superior region. In the French (at Le Bourg d'Oisans) and Tyrolean Alps it occurs with anthite, epidote, felspar, &c., in granite and gneiss and in the bedrock of the Alps, and in the Cape Colony, from which locality it was brought in the 18th century, by Colonel Prehn, the governor of the colony; hence the name Cape chrysolite and prehnite (of A. G. Werner, 1789).

Prehnite is sometimes cut and polished for small ornaments; it then somewhat resembles chrysolite in appearance.

**PREJUDICE** (Lat. *prajudicium*), literally judgment or decision beforehand, which in classical usage meant a precedent, a preceding judgment, also a special form of judicial examination precedent to a trial, especially in matters relating to *status*. The transferred sense, of injury or damage inflicted by decisions or judgments disregarding interests affected, does not appear till post-classical times in Latin. This last use of damage appears in English in relation to legal matters, especially in the phrase "without prejudice," i.e. without detriment to rights or claims. When two parties are negotiating for the settlement of a dispute, statements or admissions made by or on behalf of either, with a stipulation, expressed or implied, that the statements are made "without prejudice" to the party's claims in the dispute, cannot be put in evidence in litigation to settle the dispute (see Evidence). The general meaning of the word is that of judgment, favourable or hostile, based on prepossessions, and therefore biased or unreasonable.

**PREL, KARL ERHERR VON** (1839-1890). German philosopher, born at Landshut on the 3rd of April 1839. After studying at the university of Munich he served in the Bavarian
army from 1859 to 1872, when he retired with the rank of captain. He then gave himself up to philosophical work, especially in connexion with the theory of organic evolution, and originating from the modern psychological standpoint. He attempted to deduce the existence of spirit, apart from, and yet entering from time to time into connexion with, the phenomena of the senses, by an examination of the relation between the ego of thought and the age of sensible experience as understood by Kant. In 1868 he received the degree of doctor from the university of Tübingen in recognition of a treatise on the psychology of Dreams (Oneirokritikon. Der Traum vom Standpunkte des transcendentalen Idealismus).

Subsequently, he published numerous works on various psychological and scientific subjects, of which the more important are: Der gesunde Menschenverstand vor den Problemen der Wissenschaft (1872); Der Kampf ums Dasein um die Welt (1874), republished in 1882 under the title Entwicklungsgeschichte des Weltalls; Die planetenbewohner und die Nebularkapelle (1880); Die Philosophie der Mystik (1885); Justus von Leiningen and the Seher von Sigmaringen (1886); Die monistische Seelenlehre (1888); Die Mystik der alten Griechen (1890); Kants mystische Weltauskunft (1890). Studies aus dem Gebiete der Geheimwissenschaften (1890); Der Spiritismus (1893); Die Entdeckung des Seelen durch die Geheimwissenschaften (1894–1895).

In Der Kampf ums Dasein am Himmel von von Kampspon, he applies the Darwinian doctrine of organic evolution not only to the sphere of consciousness but also even more widely as the philosophical principle of the world. He was one of a large number of German thinkers who during the latter half of the 19th century strove to treat the mind as a mechanism.

He died on the 4th of August 1890.

See Evolution: in Philosophy.

PRELATE (Lat. prælatus, set above, from praeréo, prefer), an ecclesiastical dignity of high rank. In the early middle ages the title prelate was applied to secular persons in high positions and thence it passed to persons having ecclesiastical authority. The De prælatis of Valerian is concerned with secular princes, and even as late as the 14th century the title was occasionally applied to secular magistrates. In medieval ecclesiastical usage the term might be applied to almost any person having ecclesiastical authority; it was very commonly given to the more dignified clergy of a cathedral church, but often also to ordinary priests charged with the cure of souls and, in the early days of monasticism, to monastic superiors, even to superiors of convents of women. The term occurs very frequently in the Rule of St Benedict and other early monastic rules.

In more modern usage in the Roman Catholic Church prelates, properly so-called, are those who have jurisdiction in foro externo, but a liberal interpretation has given the title a more extended application. Prelacy in the sense of "pre-eminence with jurisdiction" (praeminentium cum jurisdictione), and the idea supposes an episcopal or quasi-episcopal jurisdiction. But gradually the title was extended to ecclesiastical persons having a prominent office even without jurisdiction, and later still it has come to be applied to ecclesiastical persons marked by some special honour though without any definite office or jurisdiction.

We may therefore distinguish "true" from "titular" prelates. The true prelacy is composed of the persons who constitute the ecclesiastical hierarchy; jurisdiction is inherent in their office and gives pre-eminence, as with patriarchs, archbishops and bishops. A good example of the dependence of prelacy on jurisdiction is found in those religious orders, such as the Dominicans, who have authority is strictly elective and temporary. Thus a Dominican prior ranks ipso facto as a prelate during his three years of office, but, if not re-elected, loses this dignity with his jurisdiction.

The true, no less than the titular, prelates have their various ranks, differing as regards title, precedence, clothing and other insignia. The dressing colour of a prelate's clothing is violet; the form, like the gown or less use of violet, depends on the rank of the prelate. Four classes may be distinguished:

1. Great prelates, e.g. cardinals, archbishops and bishops.
2. Exempt prelates (prælati nullius dioecesiis, prælati nullius), i.e. abbots and religious superiors, who are withdrawn from the ordinary diocesan jurisdiction and themselves possess episcopal jurisdiction (jurisdición quasi episcopalis).
3. Roman prelates, (a) active and (b) honorary. The title is applied to numerous ecclesiastics attached by some dignity, active or honorary, to the Roman court (see CURIA ROMANA). In the list of these prelates are protonotaries apostolic, domestic prelates, private chaplains, participanti and supernumerary. Of these last there are two kinds, honorary and honorary extra urbem. Only protonotaries and domestic prelates are for life; the others lose their dignity at the death of the pope who appointed them. A special class of Roman prelates exist at Rome, endowed as a kind of ecclesiastical majority to which those members of certain families who are destined for the clerical life naturally succeed.

In the reformed churches the title was retained in England, Sweden, Denmark and Germany. The cathedral chapter of Brandenburg consists of two prelates, the dean and the senior, besides eight other members. The chapter of Merseburg contains five prelates, viz. the dean, senior, provost, custos and scholasticus. In Baden the general synod is presided over by the prelate (prælatus), i.e. the principal "superintendent." In the Church of England the term prelate has been since the Reformation applied only to archbishops and bishops. The word "prelacy," meaning no more originally than the office and dignity of a prelate, came to be applied in Presbyterian Scotland and Puritan England—especially during the 17th century—to the episcopal form of church government, being used in a derogatory sense.

See Du Cange, Glossarium medice et infimae latinitatis (new ed., by L. Favre, Niort, 1883); Paul Hinschius, Kirchenrecht (Berlin, 1869); F. H. Veringer, professor of law at Prague, Lehrbuch des katholischen, orientalischen und protestantischen Kirchenrechts (1893).

(P. G. O'N.)

PRELLER, FRIEDRICH (1804–1878), German landscape-painter, was born at Eisenach on the 25th of April 1804. After studying drawing at Weimar, he went in 1821, on Goethe's advice, to Dresden, where in 1824 he was invited to accompany the grand duke of Weimar to Belgium. He became a pupil in the academy at Antwerp. From 1827 to 1831 he studied in Italy, and in 1831 received an appointment in the Weimar school of art. In 1834–1836 he executed in tempera six pictures on subjects taken from the Odyssey in the "Roman House" at Leipzig, in 1836–1837 the landscapes with scenes from Oberon in the Wieland room in the grand-ducal palace at Weimar, and in 1836–1848 six frescoes on Thuringian subjects commissioned by the grand duchess. In 1840 he visited Norway and produced a large number of sketches, some of which are preserved at Weimar. In 1859 he revisited Italy, and on his return in 1861 he completed for the grand-ducal museum the frescoes illustrative of the Odyssey, which are held to constitute his chief claim to fame. Preller, who was also a successful etcher, died at Weimar on the 23rd of April 1878.

PRELLER, LUDWIG (1800–1881), German philologist and antiquarian, was born at Hamburg on the 15th of September 1800. After having studied at Leipzig, Berlin and Göttingen, in 1838 he was appointed to the professorship of philology at Dorpat, which, however, he resigned in 1843. He afterwards spent some time in Italy, but settled in Jena in 1844, where he became professor in 1846. In the same year he removed as head librarian to Weimar, where he died on the 21st of June 1861. His chief works are: Demeter u. Persephone (1837); Griechische Mythologie (1854–1855; 4th ed., by C. Robert, 1887 seq.); and Römische Mythologie (1858; 3rd ed. by H. Jordan, 1881–1883). He also co-operated with H. Ritter in the preparation of the most useful Historia philosophiae graecae et romanae ex fontibus locis contexta (1838; ed. H. Wellman, 1838). He contributed extensively to Ersa and Gruber's Allgemeine Enzyklopädie and Die Religion der klassischen Altertumsmwissenschaft. A complete list of his works will be found in Ausgewählte Aufsätze aus dem Gebiete der klassischen Altertumswissenschaft (ed. R. Köhler, 1864).

See G. T. Stichel, Ludwig Preller. Eine Gedächtnissrede (Weimar, 1863); C. Bursian, Geschichte der klassischen Philologie in Deutschland (1853).
PREMIUM—PRERAU

PREMIUM (Lat. præmium, profit, reward, praemium, to buy), in general, a reward or prize; a consideration. In the law of insurance, the sum of money or consideration (either annual or in a lump sum) which the insured pays the insurers in order to gain a certain amount in the event of some specific loss happening is termed a premium. The word is applied to the fee paid in consideration of being taught a trade or profession. It is also used in the sense of “bonus,” as something beyond or additional, as in the phrases, “premium bonus system,” “premium system,” where a bonus or sum is given in addition to wages in proportion to the value of the work done. On the stock exchange, when a security has not yet been fully paid up, it is customary to quote its price at par, or so much premium or discount. Par represents the amount actually paid up on it, while if it is above the level it is said to be at a premium of so much, or if below at a discount.

PREMONITION (from Lat. præ, before, monere, to advise or warn), an impression relating to a future event. Strictly the word should mean a warning proceeding from an external source. Its modern extension to all forms of impression supposed to convey information as to the future is justified on the assumption that such intimations commonly originate in the subliminal consciousness of the percipient and are thence transferred to the ordinary consciousness. In modern times the best attested premonitions are those relating to events about to occur in the subject’s own organism. It was observed by the animal-magnetists at the beginning of the 19th century in France and Germany, that certain of their subjects, when in the “magnetic” trance, could foretell accurately the course of their diseases, the date of the occurrence of a crisis and the length of time needed to effect a cure. Similar observations were subsequently recorded in Great Britain and in America (see, for instance, the case of Anna Winsor, 1860–1865, reported by Dr. Ira Barrows). The power of prediction possessed by the subject in such cases may be explained in two ways: (1) As due to an abnormal power of perception possessed by certain persons, when in the hypnotic trance, of the working of their own pathological processes; or (2) more probably, as the result of self-suggestion; the organism is “set” to explode at a given date in a crisis, or to develop the fore-ordained symptoms.

Apart from these cases there are two types of alleged premonitions. (1) The future event may be foreshadowed by a symbol. Amongst the best known of these symbolic impressions are banishes, corpse lights, phantom funeral processions, ominous animals or sounds and symbolic dreams (e.g. of teeth falling out). Of all such cases it is enough to say that it is impossible for the serious inquirer to establish any causal connection between the omen and the event which it is presumed to foreshadow. (2) There are many instances, recorded by educated witnesses, of dreams, visions, warning voices, &c., giving precise information as to coming events. In some of these cases, the dream, &c., has been put on record before its “fulfilment” is known, chance is sufficient to explain the coincidence, as in the recorded cases of dreams foretelling the winner of the Derby of 1896. In cases where such an explanation is precluded by the nature of the details foreshadowed, the evidence is found to be defective, generally from the absence of contemporary documents. The persistent belief on the part of the narrators in the genuineness of their previsions indicates that in some cases there may be a hallucination of memory, analogous to the well-known feeling of “false recognition.” Prof. Josiah Royce has suggested for this supposed form of hallucination the term “pseudo-presentiment.”

PREMONSTRATENSIA, also called Norbertines, and in English White Canons, from the colour of the habit: an order of Augustinian Canons founded in 1120 by St. Norbert, afterwards archbishop of Magdeburg. He had made various efforts to introduce a strict form of canonical life in various communities of canons in Germany; in 1120 he was working in the diocese of Laon, and there in a desert place, called Prémontré, in Aisne, he and thirteen companions established a monastery to be the cradle of a new order. They were canons regular and followed the so-called Rule of St. Augustine (see Augustinians), but with supplementary statutes that made the life one of great austerity. St. Norbert was a friend of St. Bernard of Clairvaux—and he was largely influenced by the Cistercian ideals as to both the manner of life and the government of his order. But as the Premonstratensians were not monks but canons regular, their work was preaching and the exercise of the pastoral office, and they served a large number of parishes incorporated in their monasteries. The order was founded in 1120; in 1126, when it received papal approbation, there were nine houses; and others were established in quick succession throughout western Europe, so that at the middle of the 14th century there are said to have been over 1,500 monasteries of men and 400 of women. The Premonstratensians played a predominant part in the conversion of the Wends and the Christianizing and civilizing of the territories of the Elbe and the Oder. In time mitigations and relaxations crept in, and these gave rise to reforms and semi-independent congregations within the order. The Premonstratensians came into England (c. 1143) first at Newhouse in Lincoln, and before the dissolution under Henry VIII. there were 35 houses. At the beginning of the 19th century the order had been almost exterminated, only eight houses surviving, all in the Austrian dominions. There are now some 20 monasteries and 1000 canons, who serve numerous parishes; and there are two or three small houses in England. The strength of the order now lies in Belgium, where at Tongerloo is a great Premonstratensian abbey that still maintains a semblance of its medieval state.

Welte Kirchenlexicon (2nd ed.); and Herzog Realencyklopädie (3rd ed.). The best special study is F. Winter, Die Prémonstratenser des 16. Jahrh. und ihre Bedeutung für das nordöstliche Deutschland (1895, 2 vols.).

PRÉMYSL, the reputed ancestor of the line of dukes and kings which ruled in Bohemia from 873 or earlier until the murder of Wenceslaus III. in 1306, and which was known as the Préggy slide dynasty. According to legend Prémysl was a peasant of Staditz who attracted the notice of Libussa, daughter of a certain Krok, who ruled over a large part of Bohemia, and is said to have been descended from Samo. Prémysl married Libussa, the traditional-foundress of Prague, and during the 8th century became prince of the Bohemian Čechs. His family became extinct when Wenceslaus III. died, but through females the title to Bohemia passed from the Préggyslides to the house of Luxembourg and later to the house of Habsburg.

PRENZLAU, or PRENLOW, a town of Germany, in the Prussin province of Brandenburg. It lies on the lower Ucker See, 30 m. W. by S. of Stettin by rail. Pop. (1885), 20,920. The Gothic church of St. Mary (Evangelical), dating from 1340, is one of the finest churches in the district, and the remains of the town gates, walls and towers are also interesting. The industries include wool-spinning, iron-founding, brewing and sugar-refining. Tobacco is grown in the neighbourhood, and cigars are manufactured in the town.

Prenzlau is first mentioned in a document of the close of the 12th century, and received its municipal charter in 1255. As the capital of the old Uckermark it was a frequent object of dispute between Pomerania and Brandenburg until incorporated with the latter about 1480. At Prenzlau Prince Hohenlohe, with his corps of 12,000 men, surrendered to Murat on the retreat after the battle of Jena in October 1806.

See I. Ziegler, Prenzlau, die ehemalige Hauptstadt der Uckermark (Prenzlau, 1886).

PRERAU (Czech, Přerov), a town of Austria, in Moravia, 56 m. E.N.E. of Brünn by rail. Pop. (1900), 16,738, chiefly
PREROGATIVE

Czech. It is one of the oldest towns in Moravia, and possesses a Gothic town-hall and an old castle, once occupied by Matthias Corvinus. It has an important cloth industry, and manufactures of sugar refineries, machinery and agricultural implements. Prešov was once the one time the chief seat of the Moravian Brethren.

PREROGATIVE, in law, an exclusive privilege of the Crown.

The word, originally an adjective, is derived from the centurió prærogat, or century which voted first on a proposed law (regalia) in the Roman comitia centuriata. In English law, Blackstone says, "by the word prerogative we are to understand the character and power which the sovereign hath over and above all other persons, in right of his regal dignity; and which, though part of the common law of the country, is out of its ordinary course. This is expressed in its very name, for it signifies, in its etymology, something that is required or demanded before, or in preference to, all others" (Stephen's Comm. vol. ii. bk. iv. pt. i. ch. vii.). The prerogative is sometimes called jura regalia or regalia, the regalia being either majora, the regal dignity and power, or minora, the revenue of the Crown.

The theory of English law as to the prerogative of the king seems to be not quite consistent. On the one hand, he is a perfect and irresponsible being, holding his office by divine right; George V., "by the Grace of God of Great Britain and Ireland King," is still the heading on his charters. On the other hand, his prerogatives are limited by law. This is laid down as early as the 13th century (Bracton, ch. 8). A consequence of this is that the prerogative may be confined or extended by the supreme legislative authority, and that the courts have jurisdiction to decide whether or not any alleged right falls within the prerogative. The prerogative of the Crown, still of great extent, has been gradually limited by a long series of enactments, the most worthy of notice being Magna carta, Confirmatio cartarum, Praerogativa regis, the Petition of Right, the Habeas Corpus Act, the Bill of Rights and the Act of Settlement. The most important of the obsolete prerogatives which have been at one time claimed and exercised are the following: (1) the right to impose a tax upon the subject without the consent of parliament. (2) The right to dispense with the obligation of statutes, by the insertion in a grant of the clause non obstante statuto (see Dispensation). (3) The right of purveyance and pre-emption—that is, of buying up provisions at a valuation without the consent of the owner—and the right of impressing carriages and horses (see Purveyance). (4) The authority to erect tribunals not proceeding according to the ordinary course of justice, e.g., declaring illegal by 16 Car. I. the act (taking the Star Chamber) with the consent of the marches of Wales, and the court of the president and council of the north. (5) The revenue from first-fruits and tenths (see Annates). (6) The right of corodity—that is, of sending one of the royal chaplains to be maintained by a bishop until the bishop promotes him to a benefice—has become obsolete by disuse. (7) The right by forfeiture to the property of a convict upon his conviction for treason or felony was abolished by the Felony Act 1870. (8) The immunity of the Crown from payment of costs has been taken away in almost all cases. (9) The right to alienate crown lands by grant at pleasure was taken away by 1 Anne c. 8. In very few cases has the prerogative been extended by statute; the Regulation of the Forces Act was an example of such extension. By that act the jurisdiction of lords-lieutenant of counties over the auxiliary forces was revested in the Crown.

The prerogative may be exercised in person or by delegation. The prerogative of conferring honours is generally (though not necessarily) exercised by the king in person, as in the case of investment with knighthood and military or civil decorations.

The delegation of the prerogative often takes place by commission, issued with or without a joint address from both houses of parliament. Parts of the prerogative—generally in the nature of profit, and so in derogation of the revenue of the Crown—may be

1 There is no difference in the prerogative as exercised by a king or a queen regnant, so that the word "king" in its constitutional sense includes queen. That the queen regnant has the same rights as a king was declared by 1 Mary sess. 3, c. 1.

2 The word "sovereign" is frequently applied to the king in legal works. It should be borne in mind at the same time that the king is not a sovereign in the strict sense in which the term is used by Austin.
of parliament. The king, as head of the state, is in supreme command of the army and navy for the defence of the realm. This right, contested by the Long Parliament, was finally declared by 13 Car. II, c. 6 to be in the king alone. The right of command carried with it, through various enactments and judicial decisions, the right to impress seamen in case of necessity, and to prohibit the importation of munitions of war (39 & 40 Vict. c. 36, s. 43), also the right to the soil of the foreshore and of estuaries of rivers, and the jurisdiction over territorial waters. Other rights may fall under the prerogative of war, such as the right to impress, in the name of the king, seamen employed in commerce, or the right to impress them to bear arms; or he may constitute the courts of admiralty, including the coining of money, the regulating of weights and measures, the establishing of markets and fairs, and the erecting of beacons, lighthouses and sea-marks. As parens patriae he is ex officio sovereign of the counties, and he may, by warrant, appoint a conservator of the commons of the counties, Right. Nor can he add to the jurisdiction of courts; thus he cannot give a spiritual court temporal powers. The king was in theory supposed to be present in court. Actions in the king's bench were until modern times said to be coram rege ipso, and the king could have issued a warrant for the arrest of a man not appearing by his attorney. The courts of the county and hundred elect the sheriff, who represents the executive authority. As supreme conservator of the peace, the king, through the lord-lieutenant in counties, and through the justices in cities and boroughs, appoints justices of the peace. In the same capacity he is the prosecutor of crimes. All indictments still conclude with the words "against the peace of our lord the king, his crown and dignity and all his realm and every one of them." The king's command can order the commission of a crime, the king has, as the offended party, the power of remission. The king cannot be sued by ordinary action. He may sue by ordinary action, but he has the advantage of being able to use the prerogative of war, as in the case of the earl of Strafford, who was dispossessed of his estate and sentenced to death without the king's permission to elect (see CONGÉ D'ELIRE). When any benefice is vacant by the promotion of the incumbent to a bishopric other than a colonial bishopric the king has the patronage of the bishopric. The king cannot create new ecclesiastical jurisdiction in England or in colonies other than crown colonies. Where a new bishopric is created it is under the powers of an act of parliament.

Fiscal.—The theory of the constitution is that the king, being entrusted with the defence of the realm and the administration of justice, has the right of taxing the kingdom. The bulk of the revenue of the Norman and Plantagenet kings was derived from crown lands and feudal dues. At the present day the rents of crown lands form a very small part of the revenue, and the feudal dues do not exist except in the pecuniarily unimportant cases of escheat,不在，wedlock, wrong of the crown, &c. Of the revenue a comparatively small part (the civil list) is paid to the king in person, the rest (the consolidated fund) is applied to public purposes.

Prerogative Proctor is the name given to certain methods of procedure by which the Crown alone has the right of using; such are inquest of office (an inquiry by jury concerning the right of the Crown to land or goods, extent (a mode of execution), scire facias (for the resumption of a grant), and information (by which process the king, in the name of the Crown, by a writ to the attorney-general, can obtain a public warning or for injury to crown property).

Prerogative Writs.—Certain writs are called "prerogative writs," as distinguished from writs of right, because it is within the prerogative of the Crown alone to make or issue them. Besides the authorities cited, see Allen, Inquiry into the Rise and Growth of the Royal Prerogative in England; Chitty, The Prerogative of the Crown; Staunforde, Exposition of the King's Prerogative; Comyn, Constitutional Law; and the works of W. Bagenet, S. Low, A. V. Dicey and Sir W. Anson, on the Constitution.

**PREROGATIVE COURTS**

The name given to the English provincial courts of Canterbury and York, as far as regards their jurisdiction over the estates of deceased persons. They had jurisdiction to grant probate or administration where the diocesan courts could not entertain the case owing to the deceased having died possessed of goods above the value of £5 (bona notabilia) in each of two or more dioceses. The jurisdiction of the prerogative courts was transferred to the Court of Probate in 1857 by the Prerogative Courts Act 1857. The Divorce and Admiralty Division of the High Court of Justice by the Judicature Act 1875. In the state of New Jersey, United States, the court having jurisdiction over probate matters is called the Prerogative Court.

**PREBYSHERY.** (Gr. πρεσβυτερίον, elder, the comparative of πρεσβύς, old man), the title borne from very early times by certain officers or ministers of the Christian Church intermediate between the bishop and the deacon. The specialized use of the word as implying not only age, but consequently wisdom and authority, is analogous to that of "senate" (from senior), of "gerousia" (from γερός, and of "elder." It is the original form of priest (q.v.). The word is not found in pre-Christian writings except in the Septuagint, though as Deissmann has shown it is found on the Papyri as an official title for the village magistrates of Egypt and the members of the γερουσία, or senate, of many towns in Asia Minor. The office is, however, closely analogous to, and perhaps founded on, a similar office in the Jewish synagogue organization among the officials of which were the sekenim, or elders, sometimes identified with the archiepiscopal bishops. In the New Testament the Greek word is used both for the ancient Jewish official and for the Christian elder. On Jewish tombstones of the Hellenistic period the title is frequently found, sometimes applied to women. The head official of the English Jews prior to their expulsion bore the title of Presbyter judaorum; opinions differ as to whether this officer was ecclesiastical or had merely the secular duty of supervising the exchequer of the Jews (see further The Jewish Encyclopedia.

The history of presbyterial government as opposed to episcopal and patriarchal (see PAPIST) is discussed in detail. After the Reformation, however, it was adopted by Calvin and his followers, who created that system which has ever since been known as Presbyterianism (q.v.). There are many theories as to the origin of the office of presbyter in the Christian Church. (1) The theory adopted by the majority of English historians is, while refusing to accept the connexion between the presbyters and the seven, to regard the office as distinctively primitive and say that it was taken over by the earliest Christian community at Jerusalem from its Greek source. (2) There is also an opinion that the office of presbyter is a misnomer for prophet or prophet; and a few other modern scholars maintain that the office of presbyter did not come into existence till the 2nd century. During the last quarter of the 1st century, a three-fold organization is found in the Christian Church: (a) a number of apostles, including the twelve and prophets and teachers who had been awakened by the spirit and by the spirit endowed; (b) an administrative organization, "for the care of the poor, for worship, for correspondence, the congregation necessary," (c) a more formal organization of the clergy, and bishops, the former for higher, the latter for inferior services; (d) a patriarchal organization based upon the natural deference of the younger to the elders of the members of the Church. The senior members of the fellowship who became known as presbyters or bishops were chosen by the conduct and guided the actions of the younger and less experienced portion of the Church, though they held no official position and were not appointed for any particular work like the bishops and deacons. In the 2nd century the patriarchal element in the organization was merged in the administrative, and the presbyters
became a definite order in the ministry. The time at which the change occurred cannot be definitely fixed. "In some congregations," as Harnack says, "it may have been long before the elders were chosen, in others this may have come very soon; in some the sphere of the presbyters and deacons has been quite indefinite and in others more precise." Harnack's theory is based upon the following arguments: (a) The silence of the genuine Epistles of St Paul and the Epistle to the Hebrews. In the case of the latter (also of Colossians) that C. H. and other presbyters, teachers, miracles, gifts of healing, helps, governments; but of presbyters he has not a word to say. Even from passages where he is speaking of the jurisdiction of the congregation, as for example in 1 Cor. vi, the presbyters are absent, while in Phil. i. 1 it is the bishops and deacons that he mentions. (b) The documents in which presbyters are mentioned in an official sense, viz. the Epistle of James, the first Epistle of Peter, the Acts of the Apostles and the Pastoral Epistles belong to a later age and reflect the constitution and functions of the day rather than those of the Jerusalem Church. (c) Even Clement of Rome does not say that the apostles had appointed presbyters in the congregation, he speaks only of bishops and deacons. For this reason the statement in Acts xiv. 23 that the churches in Asia acknowledged such a position. These arguments are not absolutely decisive. It is true that presbyters are not mentioned in the genuine Epistles of St Paul, but there are hints that similar offices existed in some of the churches founded by him, viz. his three emissaries, which seems to be practically the case. But his absence of presbyters were practically identical, there is of course a specific reference to them in Phil. i. 1. The "leaders" who are mentioned three times in Hebrews xii. were also "presbyters" under the name of "elders." Harnack does not regard the validity upon certain conclusions with regard to the date of James and 1 Peter, which are not universally accepted. Few English scholars, for instance, would accept as late a date as 120-140 for the former or as early as 100 A.D. for the latter as he himself admits, though he prefers a date in the reign of Domitian. If this possibility in regard to 1 Peter is granted, it is fatal to the theory, because at the time when the epistle was written official presbyters were not yet established. The second and degeneration had begun to creep into the sphere of the elders, in the exiguity of "lording it over their heritage" and making a profit out of their office (1 Pet. v. 1-5). With regard to the testimony of Acts, the only question, since Harnack admits the Lukan authorship of the second stage of the organization of the church as it existed at the time of the events recorded or reflecting the arrangements which prevailed at the time when the book was written. It is difficult to see how Luke can have been wrong with regard to the apostolic elders, if he can be trusted as in Acts x, v. 2-12 to tell us more than the occasion (xx. 15-17). The only mistake that seems possible is that he may have conferred a later title upon the emissaries of the Church of Ephesus. This is not likely, but, at all events, the influence would have been proved to have existed at Ephesus, for otherwise Luke could not possibly have put into the mouth of Paul the address which follows. Neither is there prima facie ground for objecting to the statements with regard to the Council of Jerusalem as being later than the Lukan age of the church. The apse of any official, it is highly probable that those officials bore the name and took over the functions of the elders of the synagogue. The statement in Acts xiv. 23, that Paul and Barnabas appointed elders in the churches with such commission, these arguments to the contrary, perhaps, owing to the silence of the Epistle to the Galatians. With regard to the evidence of the Epistle of Clement, Harnack seems to be incorrect in his conclusions. Scholars of such opposite schools of thought as Harnack and Schmiedel, who in the name of C. H. and that contains the most explicit references to presbyters of the official type. The crucial passage (xiv. 4-6) seems to bear out their contention. It will be no light sin for us if we thrust out of the overruling possibility that these who have offered the gifts unlearned and holy, blessed who are those presbyters have gone before ... for they have no fear lest any one should remove them from their appointed place (ἀπὸ τοῦ δικτάτου τοῦ τόπου). There is an equally explicit reference in iv. 2: "Only let the flock of Christ keep in step with its duly-appointed presbyters (υἱοῦ τῶν καθολικῶν ἀρχιερεῶν)."

The conclusions which we seem to reach are as follows: (1) In the earliest stage (between 30 and 60) there is no uniform organization in the Christian Church. Presbyters are found in Jerusalem from primitive times. In the Pauline churches the name is not found except at Ephesus and possibly in south Galatia, though there are traces of the office, at any rate in germ, under different titles. In the Acts of the Apostles we are told that there were 60 and 100 there is an increasing tendency towards uniformity. The title is found definitely mentioned in connexion with the churches of Asia Minor (1 Pet. i. 1), Corinth (Epistle of Clement) and Crete (Titus). In the second stage (between 60 and 200) the term "bishops," the former denoting the office, the latter the function (exercising the oversight). The substantial identity of the two titles cannot be doubted in the light of such passages as Acts xx. 17, 28; 1 Pet. v. 1, 2; 1 Tim. iii. 7-17 and Titus i. 5-7.

There is far less controversy with regard to the later history of the presbyters. The third stage of the development of the office is marked by the rise of the single episcopus as the head of the individual church (see Bishop; Episcopacy). The first trace of this is to be found in the Epistle of Ignatius, which proves that by the year 115 the three orders as they were afterwards called—bishop, presbyters and deacons—already existed, not indeed universally, but in a large proportion of the churches. The presbyters occupied an intermediate position between the bishop and the deacons. They constituted "the council of the bishop." It was some time before the threefold ministry became universal. The Didache knows nothing of the presbyters; bishops and deacons are mentioned, but there is no reference to the second order. The Shepherd of Hermas knows nothing of the single bishop; the churches are under the control of a body of presbyter-bishops. Before the close of the 2nd century however the three orders were established almost everywhere. The sources of the Apostolic Canons which date between 140-180 lay down the rule that even the smallest community of Christians, though it contain only twelve members, must have its bishop and its presbyters. The original equality of bishops and presbyters was still however theoretically maintained. The Canons of Hippolytus which belong to the 2nd century declare that at the ordination of a presbyter everything is to be done as in the case of a bishop, save that he does not sit himself upon the throne. The same prayer shall also be said as for a bishop, the name of the bishop only being left out. The presbyter shall in all things be equal with the bishop, save in the matter of presiding and ordaining, for the power to ordain is not given him. The presbyters formed the governing body of the church. It was their duty to maintain order, exercise discipline, and superintend the affairs of the Church. At the beginning of the 3rd century, if we are to believe Tertullian, they had no spiritual authority of their own, at any rate as far as the sacraments are concerned. The right to baptize and celebrate the communion was delegated to them by the bishop.

In the fourth stage we find the presbyters, like the bishops, becoming endowed with special sacerdotal powers and functions. Up to the end of the 2nd century the universal priesthood of all believers was the accepted doctrine of the Church. It was not till the middle of the 3rd century that the priesthood was restricted to the clergy. Cyprian is largely responsible for the change, though traces of it are found during the previous half century. Cyprian bestows the highest sacerdotal terms upon the bishops of course, but his references to the priestly character of the office of presbyter are also most definite. Henceforth presbyters are recognized as the secondum sacerdotium in the Church.

With the rise of the diocesan bishops the position of the presbyters became more important. The charge of the individual church was entrusted to them and gradually they took the place of the local bishops of earlier days, so that in the 5th and 6th centuries an organization was reached which approximated in general outline to the system which prevails in the Anglican Church to-day.

See Hatch, Organization of the Early Christian Churches (2nd ed., 1882), and Harnack's "excursus" in the German edition of this work.

1 Hort translates ἀρχίερεῖς those who care for you, but 1 Tim. ii. 7, where ἀρχιερεῖς evidently refers to "the president of the church," and in a recently discovered papyrus which Ramsay dates to a certain bishop is described as ἀρχιερείας, Studien in Röm. Provenzesse, pp. 125-126.

2 Apol. i. 67, ἀρχιερεῖς evidently refers to "the president of the church," and in a recently discovered papyrus which Ramsay dates to a certain bishop is described as ἀρχιερείας, Studien in Röm. Provenzesse, pp. 125-126.

5 Tertull. De bapt., 17: "Baptismi dandi habebit jus sumus sacramentes qui est episcopus; dehcipresbyteri . . . non tamens sine episcopi auctoritate.

6 Cf. Ep. 38: "Presbyteri eum episcopo sacerdotali honore conjuncti."
PRESBYTERIANISM, a highly organized form of church government in which presbyters or elders occupy a prominent place. As one of the three principal systems of ecclesiastical polity known to the Christian Church, Presbyterianism occupies an intermediate position between episcopacy and congregationalism. A brief comparison with these will indicate its salient features. In episcopacy the supreme authority is a diocesan bishop; in congregationalism it is the members of the congregation assembled in church meeting; in Presbyterianism it is a church council composed of representative presbyters. In episcopacy the control of church affairs is almost entirely withdrawn from the people; in congregationalism it is almost entirely exercised by the people; in Presbyterianism it rests with a council composed of duly appointed office-bearers chosen by the people. The ecclesiastical unit in episcopacy is a diocese, in presbyterianism it is the presbytery, in congregationalism it is a single church, self-governed and entirely independent of all others; in Presbyterianism it is a presbytery or council composed of ministers and elders representing all the churches within a specified district. It may be said broadly, therefore, that in episcopacy the government is monarchical; in congregationalism, democratic; and in Presbyterianism, aristocratic or representative.

1.—THE SYSTEM DESCRIBED

As compared with the Church of England (Episcopal) in which there are three orders of clergy—bishops, priests and deacons, the Presbyterian Church recognizes but one spiritual order, viz. presbyters. These are ecclesiastically of equal rank, though differentiated, according to their duties, as ministers who preach and administer the sacraments, and as elders who are associated with the ministers in the oversight of the people. There are deacons in Presbyterianism inferior in rank to presbyters, their duties being regarded as non-spiritual.

The membership of a Presbyterian Church consists of all who are enrolled as communicants, together with their families. Others who worship regularly, without becoming communicants are called adherents. Only communicants exercise the rights of membership. They elect the minister and other office-bearers. But, in contrast with Congregationalism, when they elect and "call" a minister their action has to be sustained by the presbytery, which judges of his fitness for that particular sphere, of the measure of the congregation's unanimity, and of the adequacy of financial support. When satisfied, the presbytery proceeds with the ordination and induction. The ordination and induction of ministers is always the act of a presbytery. The ordination and induction of elders in some branches of the Church is the act of the kirk-session; in others it is the act of the presbytery.

The kirk-session is the first of a series of councils or church courts which are an essential feature of Presbyterianism. It is the council of the church, the "kirk," when it is not sitting as a court. The kirk-session is ex officio president or moderator. Without his presence or the presence of his duly-appointed deputy the meeting would not be in order nor its proceedings valid. The moderator has not a deliberative, but only a presiding, role. (This is true of the moderator in all the church courts.) Neither the session nor the congregation has jurisdiction over the minister. He holds his office at vocation out pulpitum; he cannot demit it or be deprived of it, except in some very exceptional cases. He is, in the last analysis, a layman, though he exercises an influence among the people to whom he ministers is to a large extent secured. The kirk-session has oversight in regard to such matters as the hours of public worship, the arrangement for the execution of church office, and the exercise of church discipline. New members are either catechumens or members transferred from other churches. The former are received after special instruction and profession of faith; the latter on presenting a certificate of church membership from the church which they have left. Though the admission of new members is, strictly speaking, the act of the session, this duty usually devolves upon the minister, who reports his procedure to the session for approval and confirmation. Matters about which there is any doubt or difficulty, or division of opinion in the session, may be carried for settlement to the next higher court, the presbytery.

The presbytery consists of all the ministers and a selection of the ruling elders from the congregations within a prescribed area. The presbytery chooses its moderator periodically from among its ministerial members. His duty is to see that the principles and procedures upon which Presbyterianism rests are understood and respected. The presbytery has no special power or authority over its brethren, but is honoured and obeyed as primus inter pares. The work of the presbytery is episcopal. It has the right and power to suspend a minister for delinquency, to take references from kirk-sessions or appeals from individual members; sanctions the formation of new congregations; supervises the education of students for the ministry; stimulates and guides preaching and sound expository preaching within the bounds of the presbytery. It can annul the proceedings of two or more members of presbytery, for the transgression of two or more members of presbytery, for the transaction of business which has suddenly emerged. The first question considered at a pro re nata meeting is the action of the moderator of the presbytery, and the second to be discussed in the same meeting proceeds, if the meeting is dissolved. Appeals and complaints may be taken from the presbytery to the synod.

The synod is a provincial council which consists of the ministers and elders sent from the presbyteries. It reviews the proceedings of all the presbyteries within a specified number of presbyteries, in the same way as the presbytery is representative of a specified number of churches. Though higher in rank and larger in membership than the presbytery, its function is to represent, and not to exercise authority over, the presbytery. It is a court of first instance, and yet, like the general assembly, a court of final appeal. The synod at its first meeting chooses a minister as its moderator whose duties, though somewhat administrative, are largely ceremonial. His position is one of great honour and influence, but he remains a simple presbyter, without any special rule or jurisdiction. The general assembly reviews all the work of the Church; settles controversies; makes administrative laws; directs and controls the mission and other spiritual work; appoints professors of theology; admits to the ministry applicants from other churches; hears and decides complaints, references and appeals which have come up through the synod and presbytery; determines the position of the Church's interests or with the general welfare of the people. As a judicatory it is the final court of appeal; and by it alone can the graver censures of church discipline be reviewed and annulled. This branch of the Church's court is held at the time and place agreed upon and appointed by its predecessor.

By means of these series of conciliar courts the unity of the Church is secured and made manifest; the combined, simultaneous effort of all the Church's members is directed to bringing out what they agree on, are carried for settlement to a larger and higher judiciary, free from local feeling and prejudice. As access to the church courts is the right of all, and involves but slight expense, the liberation of even the humblest member of the Church is safeguarded, and local oppression or injustice is rendered difficult.

The weak point in the system is that episcopal superintendence and discipline is not in the Church. There is no hierarchy in the Presbyterian Church; there is no one, moderator or senior member, whose special duty it is to take initial action when the unpleasant work of judicial or ecclesiastical discipline becomes necessary. This is left to the judgment of the Church, and the judgment is a more responsible and impartial one. The presbytery is given greater responsibility and has its period of office prolonged; should be made, in fact, more of a bishop in the Anglican sense of the word.

Though the jus divinum of presbytery is not now insisted upon as in some former times, Presbyterians claim that it is the Church polity set forth in the New Testament. The case is usually stated somewhat as follows. With the sanction and under the
Presbyterianism

PRESBYTERIANISM

6 These and appointed in synagogue expressly expositors.

The elders were in every Christian church a plurality of elders. The elders were different from the deacons, but there is no indication that any one elder was of higher rank than the others. The elder was not an officer in the church, but an officer in the church; the elder was a bishop. The two titles are applied to the same persons. See Acts xx. 17, 28; “he sent and called for the elders of the church, . . . Take heed to all the flock over which the Holy Ghost hath made you bishops. See also Tit. 5, 6. Order elders for . . . a bishop must be blameless.” This is now adopted by modern expositors. The elders were chosen by the people. This is not expressly stated in the New Testament but is regarded as a necessary inference. When an apostle was about to be chosen as successor to a bishop, the office was partly in the hands of the people and when deacons were about to be appointed the Apostles asked the people to make the choice. It is inferred that elders were similarly chosen. It is worthy of notice that there is no account at all of the ordination of the first generation of bishops. Probably the recognition and appointment of elders was simply the transfer from the synagogue to the Church of a usage which was regarded as essential among Jews; and the Gentile churches naturally followed the example of the Jewish Christians. The elders thus chosen by the people and inducted to their office by the Apostles as a church court. Only thus could a plurality of rulers of equal rank act in an efficient and orderly way. They would discharge their pastoral care by the Holy Spirit, and in the same way as a synod or council was called together for the purpose. The action of Paul and Barnabas at Antioch seems to accord with Presbyterian rather than Congregational polity. The latter would have required that the church of the Gentiles should have been settled by the church at Antioch instead of being referred to Jerusalem. And the decision of the council at Jerusalem was evidently more than advisory; it was authoritative and meant to be binding on all the churches.

The principle of ministerial parity which is fundamental in Presbyterianism is founded not merely on apostolic example but on the words of Christ Himself: “Ye know that the princes of the Gentiles exercise dominion over them, and they that are great exercise authority upon them. It shall be according to their reward.”

From the foregoing outline it will be seen that Presbyterianism may be said to consist in the government of the Church by representative assemblies composed of the two classes of presbyters, ministers and elders, and so arranged as to manifest and realize the visible unity of the whole Church. Or it may be described as denying (1) that the apostolic office is perpetual and should still exist in the Christian Church; (2) that all church power should be vested in the clergy; (3) that each congregation should be independent of all the rest; and as asserting (1) that the people ought to have a substantial part in the government of the Church; (2) that presbyters, i.e. elders or bishops, are the highest permanent officers in the Church and are of equal rank; (3) that an outward and visible Church is one in the sense that a smaller part is controlled by a larger and all the parts by the whole.

Though Presbyterians are unanimous in adopting the general shape of the Church polity as here outlined, and in claiming New Testament authority for it, there are certain differences of view in regard to details which may be noticed. There is no doubt that considerable indefiniteness in regard to the precise status and rank of the ruling elder is common prevalent. When ministers and elders are associated in the membership of a church court their equality is admitted; no such idea as voting by orders is ever entertained. Yet even in a church court inequality, generally speaking, is visible to the extent that an elder is not usually eligible for the moderator’s chair. In some other respects also a certain disparity is apparent between a minister and his elders. Practically the minister is regarded as of higher standing. The duty of teaching and of administering the sacraments and of always presiding in church courts being strictly reserved to him invests his office with a dignity and influence greater than that of the elder. It was inevitable, therefore, that this question as to the exact status of the ruling elder should claim attention in the discussions of the Pan-Presbyterian Alliance. At its meeting in Belfast in 1884 a report was submitted by a “committee on the eldership” which had been previously appointed. According to this committee there are prevalent three distinct theories in regard to the office and function of ruling elders:

I. That while the New Testament recognizes but one order of presbyters there are in this order two degrees or classes, known as teaching elders and ruling elders. In teaching, it dispenses the sacraments, in presiding over public worship, and in the pastoral function, that is to say, as the head of the church, he presides over the instruction and the improvement of the people committed to his care, a pastor acts within his parish (or congregation) according to his own discretion; and for the discharge of all the duties proper to one accountable for the discipline of a people. This is the teaching of the first-named elders. They have no right to teach or to dispense the sacraments, and on this account they fill an office in the Presbyterian Church inferior in rank and power to that of the pastors. Their peculiar business is to exercise the term “ruling elders.”

II. A second theory is contended for by Principal Campbell in his treatise on the eldership, and by others also, that there is no warrant in Scripture for the eldership as it exists in the Presbyterian Church; that the ruling elder is not, and is not designed to be, a counterpart of the New Testament elder; in other words, that he is not a presbyter, but only a layman chosen to represent the laity in the church courts and permitted to assist in the government of the church in the name of the laity.

III. A third theory, advanced by Professor Withrow and others, is that the modern elder is intended to be, and should be, recognized as a copy of the scriptural presbyter. Those who take this view regard the “first-named elders” as mere clergy and “ruling elders” as officers who are to perform the same duties. They take the argument that the word “elder” in the New Testament always designates a clergyman as to title and function, and they are in favor of the term “ruling elders.”

The practice of the Presbyterian churches of the present day is in accord with the first-named theory. Where attempts are made to reduce the third theory to practice the result is not satisfactory. Nor is the first-named theory less in harmony with teaching than the third. In the initial stages of the Apostolic Church it was no doubt sufficient to have a plurality of presbyters with absolutely similar duties and powers. At first, indeed, this may have been the only possible course. But apparently it soon became desirable and perhaps necessary to specialize the work of teaching by setting apart for that duty one presbyter who should withdraw from secular occupation and devote his whole time to the work of the ministry. There seems to be evidence of this in the later writings of the New Testament. It is now held by all Presbyterian churches that one presbyter in every congregation should have specially committed to him the work
of teaching, administering the sacraments, visiting the flock pastorally, and taking oversight, with his fellow elders, of all the interests of the church. To share with the minister such general oversight is not regarded by intelligent and influential laity as an incongruous or unworthy office; but to identify the duties of the eldership, even in theory, with those of the minister is a sure way of deterring from accepting office many whose counsel and influence in the eldership would be invaluable. Another subject upon which there is a difference of opinion in the Presbyterian churches is the question of Church Establishments. The view, originally held by all Presbyterian churches in Great Britain and on the Continent, that union with and support by the civil government are not only lawful but also desirable, is now held only by a minority, and is practically exemplified among English-speaking Presbyterians only in the Church of Scotland (see Scotland, CHURCH OF). The lawfulness of Church Establishments with due qualifications is perhaps generally recognized in theory, but there is a growing tendency to regard connexion with the state as inexpedient, if not actually contrary to sound Presbyterian principle. That this tendency exists cannot be denied, and greatdanger to its policy. That its influence by identifying Presbyterianism with dissent in England and Scotland, is unfavourable to the general tone and character of the Presbyterian Church.

Those who favour state connexion and those who oppose it agree in claiming spiritual independence as a fundamental principle of Presbyterianism. That principle is equally opposed to Erastianism and to Papacy, to the civil power dominating the Church, and to the ecclesiastical power dominating the state. All Presbyterians admit the supremacy of the state in things secular, and they claim supremacy for the Church in things spiritual. Those who favour a Church Establishment hold that Church and state should each be supreme in its own sphere, and that on these terms a union between them is not only lawful but is the highest exemplification of Christian statesmanship. So long as these two spheres are at all points clearly distinct, and so long as there is a desire on the part of each to recognize the supremacy of the other, there is little danger of friction or collision. But when spiritual and secular interests come into unfriendly contact and conflict, the Church becomes involved in the inevitable; from which sphere, the spiritual or the civil, is the final decision to come? Before the Reformation the Church would have had the last word; since that event the right and the duty of the civil power have been generally recognized.

The origin of Presbyterianism is a question of historical interest. By some it is said to have begun at the Reformation; by some it is traced back to the days of Israel in Egypt; by most, however, it is regarded as of later Jewish origin, and as having come into existence in its present form simultaneously with the formation of the Christian Church. The last is Bishop Lightfoot's view. He connects the Christian ministry, not with the worship of the Temple, in which were priests and sacrificial ritual, but with that of the synagogue, which was a local institution providing spiritual edification by the reading and exposition of Scripture. The first Christians were regarded, even by themselves, as a Jewish sect. They were spoken of as "the way." They took with them, into the new communities which they formed, the Jewish polity or rule and oversight by elders. The appointment of these elders regarded as a matter of course, and would not seem to call for any special notice in such a narrative as the Acts of the Apostles.

But Presbyterianism was associated in the 2nd century with the concept of episcopacy. This episcopacy was at first rather congregational than diocesan; but the tendency of its growth was undoubtedly towards the latter. Hence for proof that their church polity is apostolic Presbyterians are accustomed to appeal to the New Testament and to the time when the apostles were still living; and the ancestors of the apostles, the presbyters, or early bishops, of prelacy Episcopalians appeal rather to the early Church fathers and to a time when the last of the Apostles had just passed away. It is generally admitted that distinct traces of Presbyterian polity are to be found in unexpected quarters (e.g. Ireland, Iona, the Culebres, &c.) from the early centuries of church history and throughout the medieval ages down to the Reformation of the 16th century. Only in a very modified sense, therefore, can it be correctly said to date from the Reformation.

At the Reformation the Bible was for the great mass of both priests and people a new discovery. The study of it shed floods of light upon all church questions. The leaders of the Reformation searched the New Testament not only for doctrinal truth but also to ascertain the polity of the primitive Church. This was specially true of the Reformers in Switzerland, France, Scotland, Holland and in some parts of Germany. Luther gave little attention to New Testament polity, though he believed in and clung passionately to the universal priesthood of all true Christians, and rejected the idea of a sacerdotal caste. He had no dream or vision of the Church's spiritual dominion, or that the spiritual supremacy should be with the civil power, and he believed that the work of the Reformation would in that way be best preserved and furthered. In no sense can his "consistorial" system of church government be regarded as Presbyterian.

It was different with the Reformers outside Germany. While Luther studied the Scriptures in search of true doctrine and Christian life and was indifferent to forms of church polity, they studied the New Testament not only in search of primitive church polity, but also as the decision of church polity. One is struck by the unanimity with which, working individually and often in lands far apart, they reached the same conclusions. They did not get their ideas of Church polity from another, but drew it directly from the New Testament. For example, John Row, one of the five commissioners appointed by the Scottish Privy Council to draw up what is now known as the First Book of Discipline, distinctly says that it was not their example from any kirk in the world; no, not from Geneva; but they drew their plan from the sacred Scriptures. This was true of them all. They were unanimous in rejecting the episcopacy of the Church of Rome, thesanctity of the episcopacy of the schismatic Church of the middle ages, the sacraments, the authoritative nature of the Church. They were unanimous in adopting the idea of a church in which all the members were priests under the Lord Jesus, the One High Priest and Ruler: the officers of which were not mediators between men and God, but preachers of the Word, officers, Christ's mediators, and, in salvation, not by benediction, but by the grace of God, they must be also spiritual rulers, not in virtue of any magical influence transmitted from the Apostles, but in virtue of their election by the Church and of their appointment in the name of the Lord Jesus. When the conclusions thus reached by many independent investigators were at length reduced to a system by Calvin, in his famous Institutio, it became the definite idea of church government for all the Reformed, in contradistinction to the Lutheran, churches.

Yet we do not find that the leaders of the Reformed Church succeeded in establishing at once a fully-developed Presbyterian polity. Powerful influences hindered them from realizing their ideal. We notice two. In the first place, the people generally desired that the Church should be on the model of the early Church. So dearfied had been the yoke of Rome, which they had shaken off, that they feared to submit to anything similar even under Protestant auspices. When their ministers, moved by an intense desire to keep the Church pure by means of the exercise of its discipline, visited and disciplined discipline. The second powerful influence was of a different kind, viz. municipal jealousy of church power. The municipal authority in those times claimed the right to exercise a censorship over the ministers' private lives. The use of the church to exercise discipline was resented as an intrusion. It has been a common mistake to think of Calvin and contemporary Reformers...
as introducing a discipline of stern repression which made the innocent gaieties of life impossible, and produced a dull uniformity of straitlaced manners and hypocritical morals. The discipline was there before the Reformers. There were civil laws which regular clerical conduct and supported the discipline. Hence friction, at times, between the Reformers and civic authorities friendly to the Reformation; not as to whether there should be "discipline" (that was never doubted) but as to whether it should be ecclesiastical or municipal. Hence the Reformation there were powerful influences opposed to the setting up of church government and to the exercise of church discipline after the manner of the apostolic Church; and one ceases to wonder at the absence of complete Presbyterianism in these countries which were forward to embrace and adopt the Reformation. Indeed the more favourable the secular authorities were to the Reformation the less need there was to discriminate between civil and ecclesiastical jurisdiction; hence the stricter discipline should be exercised. We look in vain, therefore, for much more than the germ and principles of Presbyterianism in the churches of the first Reformers. Its evolution and the thorough application of its principles were in these countries which were forward to embrace and adopt the Reformation. Indeed the more favourable the secular authorities were to the Reformation the less need there was to discriminate between civil and ecclesiastical jurisdiction; hence the stricter discipline should be exercised. We look in vain, therefore, for much more than the germ and principles of Presbyterianism in the churches of the first Reformers. Its evolution and the thorough application of its principles were in these countries which were forward to embrace and adopt the Reformation.

The doctrines of Presbyterianism are those generally known as evangelical and Calvinistic. The supreme standard of belief is the Word of God in the original languages.

The subordinate standards have been numerous, though marked by striking agreement in the main body of Christian doctrine which they set forth. Much has been done of late years to make these subordinate standards of reformed doctrine more generally known. The following list is fairly comprehensive:

- France. "Confession calvinica" (1559).
- Hungary. "Hungarian Confession" (1562).
- Bohemia. "Bohemian Confession" (1609).

The form of worship associated with Presbyterianism has been marked by extreme simplicity. It consists of reading of the Holy Scripture, psalmody, non-liturgical prayer and preaching. There is nothing in the standard forms of Presbyterian worship in the early books of order a few forms of prayer were given, but their use was not compulsory. On the whole, the preponderating preference has always been in favour of so-called extemporaneous, or free prayer; and the Westminster Directory of Public Worship has to a large extent stereotyped the form and order of the service in most Presbyterian churches. Within certain broad outlines much, perhaps too much, is left to the choice of individual congregations. It used to be customary among Presbyterians to stand during public prayer, and to remain seated during the acts of praise, but this peculiarity is no longer maintained. The psalms rendered into metre were formerly the only vehicle of the Church's public praise, but hymns are now also used in most Presbyterian churches. The organs used to be regarded as contrary to the New Testament example, but the use of organs is now all but universal. The public praise used to be led by an individual called the "precentor," who occupied a box in front of, and a little lower than, the pulpit. Choirs of male and female voices now lead the church praise.

Presbyterianism has two sacraments, baptism and the Lord's Supper. Baptism is administered both to infants and adults by immersion, pouring or sprinkling, but the mode is considered immaterial. The Lord's Supper, as generally observed throughout the various Presbyterian churches, is a closed communion, with a shorter service than in the Dutch Reformed Church. The "Old Hundred," and "Old 124th" mean the 100th and 124th Psalms in that old book.

The Swiss, owing to their peculiar geographical position and to certain political circumstances, early manifest independence in ecclesiastical matters, and became accustomed to the

1 Principal Rous's version is the best known and most widely used. It is an English work. Somewhat reluctantly it was accepted by Scottish Presbyterianism as a substitute for an older version with a shorter crime of metre and music. "Old Hundred," and "Old 124th" mean the 100th and 124th Psalms in that old book.

II.—HISTORY IN DIFFERENT COUNTRIES

From this general outline of Presbyterianism we now turn to consider its evolution and history in some of the countries with which it is or has been specially associated. We omit, however, one of the most important, viz. Scotland, as the history is fully covered under the separate headings of Scotland, Canada, and allied societies.

Scotland.

The Swiss, owing to their peculiar geographical position and to certain political circumstances, early manifest independence in ecclesiastical matters, and became accustomed to the
management of their church affairs. The work of Zwingli as a Reformer, important and thorough though it was, did not concern itself actually with church polity. Ecclesiastical affairs came, as a matter of course, wholly under the management of the cantonal and municipal authorities, and Zwingli was content that it should be so. The work of Farel, previous to his coming to Geneva, was almost entirely evangelistic, and his first work in Geneva was of a similar character. It was the town council which made arrangements for religious disputations, and provided for the housing and maintenance of the preachers. When Calvin,

Calvin, at Farel's invitation, settled in Geneva (1536) the work of reformation became more constructive.

"The need of the hour was organization and familiar instruction, and Calvin set himself to work at once." The first reforms he wished to see introduced concerned the Lord's Supper, church praise, religious instruction of youth and the regulation of marriage. In connexion with the first he desired that the disciplina de l'excommunication should be exercised. His plan was partly Presbyterian and partly consistorial. Owing to certain circumstances in its past history, Geneva was notoriously immoral. The rule of dissolute licentiousness and of immoral conduct and of the excommunication of the morals of the city. Even the nuns of Geneva were notorious for their conduct." Calvin suggested that men of known worth should be appointed in different quarters of the city to report to the ministers those persons in their district who lived in open sin; that the ministers should then warn such persons not to come to the communion; and that, if their warnings were unheeded, discipline should be enforced. It was on this subject of keeping pure the Lord's Table that the controversy arose between the ministers and the town councillors which ended in the banishment of Calvin, Farel and Conrad from Geneva. In 1538 the ministers took upon themselves to refuse to administer the Lord's Supper in Geneva because the city, as represented by its council, declined to submit to church discipline. The storm then broke out, and the ministers were banished (1538).

It may be convenient at this point to consider Calvin's ideal church polity, as set forth in his famous Christianae religionis institutio, the first edition of which was published in 1556. Briefly it was as follows:—

A separate ministry is an ordinance of God (Inst. iv. 3, 3).

Ministers and elders may alone preach and administer the sacraments (iv. 3, 10).

A legitimate ministry is one appointed with the consent and approbation of the people under the presidency of other pastors. The final act of ordination (with laying on of hands) shall be performed (iv. 3, 15).

Governors or persons of advanced years selected from the people and associated with the ministers in administering and executing the Church's communion is all-important, and is the special business of the governors.

His system, while preserving the democratic theory by recognizing the congregation as holding the church power, was in practice strictly aristocratic inasmuch as the congregation was invested with any direct use of power, which is invested in the whole body of elders. His great object was discipline. With regard to the relations between the Church and the civil power, Calvin was opposed to the Zwinglian idea of the civil power being handed over to the state. Calvin's refusal to administer the sacraments for which he was banished from Geneva, is important as a matter of ecclesiastical history, because it is the essence of the whole system which he subsequently introduced. It rests on the principles that the Church has the right to exclude those who are unworthy, and that she is in no way subject to the civil power in spiritual matters. During the three years of his banishment Calvin was at Strassburg, where he had been carrying out his ideas. His friends were predominant among his city's citizens and a prey to anarchy. One party threatened to return to Romanism; another threatened to sacrifice the independence of Geneva and submit to Berne. It was felt to be a political necessity that he should return, and the latter made every effort to secure that he should. These were the recognition of the Church's spiritual independence, the division of the town into parishes, and the appointment (by the municipal authority) of a consistory or council of elders in each parish for the exercise of discipline.

These terms were embodied in the famous Ordonnances ecclesiastiques de l'église de Genève (1541). The four orders mentioned in the Institutio are recognized: pastors, doctors, elders and deacons. The pastors were to preach, administer the sacraments, and in conjunction with the elders to exercise discipline. In their totality they form the venerable compagnie. A newly-made pastor was to be settled in a fixed charge by the magistrate with the consent of the congregation, after having been approved as to knowledge and manner of life by the pastors already in office. By them he was to be ordained, after vowing to be true in office, faithful to the church system, obedient to the laws and to the civil government, and ready to exercise discipline without fear or favour. The doctors were to teach the faithful in sound learning, to guard purity of doctrine, and to be amenable to discipline. The elders (Anciens, commis, ou deputés par la seigneurie ou consistoro) as the name implies, were the council or body to which the bond of union between Church and state. Their business was to supervise daily life, to warn the disorderly, and to give notice to the consistory of cases requiring discipline. To form the party, to decide the cases, and to execute the sentences was the duty of the consistory.

The early Presbyterianism of Switzerland was defective in the following respects: (1) It started from a wrong definition of the Church, which, instead of being conceived as an organized community of believers in the Lord Jesus Christ, was made to depend upon the preaching of the gospel and the administration of the sacraments. (2) The duly appointed minister, the existence of the Church was made to depend upon an organized ministry rather than an organized membership. It calls to mind the Romish formula: Ubi episcopus ibi ecclesia. (3) It did not recognize the scriptural right of the people to choose their minister and other office-bearers. (3) Its independence of civil control was very imperfect. (4) And it did not by means of church courts provide for the manifestation of the Church's unity and for the federation of its local bodies. It was left to meet every crisis.

"Calvin," says Principal Lindsay, "did three things for Geneva all of which went far beyond its walls. He gave its Church a trained ministry, its homes an educated people who could perform their duty in the pulpit, and its young men a strong tradition which was afterward to make the little town stand forth as the citadel and city of refuge for the oppressed Protestants of Europe."

France.

It is pathetic and yet inspiring to study the development of Presbyterianism in France; pathetic because it was in a time of fierce persecution that the French Protestants organized themselves into churches, and inspiring, because it showed the power which scriptural organization gave them to withstand incessant, unrelenting hostility; and the difficulty of exag- gerating the influence of Calvin upon French Pres- bantism. His Christianae religionis institutio became a standard work which his countrymen rallied in the work and battle of the Reformation. Though under thirty years of age, he became all over Europe, and in an exceptional degree in France, the leader, organizer and consolidator of the Reformation. The work which the young Frenchman did for his countrymen was immense. 3

The year 1555 may be taken as the date when French Protestantism began to be organized. A few churches had been organized earlier, at Meaux in 1546 and at Nîmes in 1547, but their members had no settled place of worship and were necessarily small. Prior to 1555 the Protestants of France had been for the most part solitary Bible students or little companies meeting together for worship without any organization. But in January, 1555, a blow was struck at the Calvinist movement. A small company had been accustomed to meet in the lodging of the sieur de la Ferrière in Paris near the Pré-au-Cleres. At one of the meetings the father of a newly-born child expressed the wish that the infant be baptized, and on the 11th of January this was done by Baptiste de Latour, the teacher of the boy and that his conscience would not permit his child to be baptized according to the rites of the Romish Church. After prayer the company constituted themselves into a church: chose Jean le Maistre to be minister, and others of their number to be elders and deacons. It seemed as if all France had been waiting for this event as a signal, for organized churches began to spring up every-
where immediately afterwards. Within two years Meaux, Poitiers, Angers, les Iles de Saintonge, Agen, Bourges, Issoudun, Aubigny, Blois, Tours, Lyon, Orleans and Rouen were organized. Thirty-six more were completely organized by 1560. According to Beza there were about this time 2540 organized churches. The later Cardinal St Croix reckoned that the Huguenots were one half of the population. One hundred and twenty-seven pastors had been sent from France to Geneva before 1567.

In 1558 a further stage in the development of the church was reached by the establishment of forty elders. It was based on a short confession drafted by Calvin in 1557, and may still be regarded, though once or twice revised, as the confession of the French Protestant Church. The book of order, Discipline ecclésiastique des églises réformées de France, was approved and published in 1567.

The First General Synod met at Paris in 1560. It consisted of representatives from, say sixty-six, others, twelve churches. It adopted a confession of faith and a book of order or discipline. The discipline was a copy of the ordinances of the French church. The body consisted of representatives of ministers and elders (anciens) from a group of congregations. Next in order was the provincial synod which consisted of a minister and an elder or deacon from each church or district. The synod was elected by the people, and the synod in its turn elected the synod of the French church. The synod was a council of elders and deacons, the members being the pastors and elders of the churches. It was the only authority in the church, and it was the only body which could make it so. When the ministry of a church became vacant the choice of a successor rested with the colloque or with the provincial synod. The people, however, might object, and if their objection was just, the two groups would refer the question to the synod. The synod of Nimes (1572) decreed that no minister might be imposed upon an unwilling people. Deacons, in addition to having charge of the poor and sick, might catechize, and occasionally offer public prayer or read the Bible. The eldership was not for life, but there was a sort of hereditary privilege. Each church was a body corporate, and each could send one representative to the synod. There was no regular synodical biology. The provincial synod met once a year, and the synod of the French church met once in two years.

The Netherlands.

From the geographical position of the Netherlands, Presbyterianism took its tone from France. In 1562 the Confessio bellica was publicly acknowledged, and in 1563 the church ordinance was arranged. In 1574 the first provincial synod of Holland and Zeeland was held, but William of Orange would not allow any action to be taken independently of the state. The Reformed churches had established themselves in independence of the state when that state was Catholic; when the government became Protestant the Church had protection and at the same time became dependent. It was a state church. By the union of Utrecht the communes and provinces had each the regulation of its own religion; hence constant conflict. In most cases it was insisted on as necessary that church discipline should remain with the civil authority. In 1576 William, with the support of Holland, Zeeland and their allies, put forth articles, by which doctors, elders and deacons were recognized; and church discipline given to the elders, subject to control by the magistrate and by the Church was placed in absolute dependence on the state. These articles, however, never came into operation; and the decisions of the synod of Dort in 1578, which made the Church independent were equally fruitless. In 1581 the Zeeland Synod divided the Church, created provincial synods and presbyteries, but could not shake off the civil power in connexion with the choice of church officers. Thus, although the congregations were Presbyterian, the civil government retained overwhelming influence. The Leiden magistrates said in 1581: "If we accept everything determined upon in the synod, we shall end by being vassals of the synod. We will not open to churchmen a door for a new mastership over government and subject us, wife and child." From 1618 a modified Presbyterian polity predominated. As a rule elders held office for only two years. The "kerk-raad" (kirk session) met weekly, the magistrate being a member ex officio. The colloque consisted of one minister and one elder from each congregation. At the annual provincial synod, held by consent of the states, two ministers and one

Presbyterianism. In 1642 the Long Parliament abolished Episcopacy (the act to come into force on the 5th of November 1643); and summoned an assembly of divines to meet at Westminster in June 1643 to advise parliament on it. This new form of government, the Westminster Assembly, through its Confession, Directory and Catechisms, has become so associated with the Presbyterian Church that it is difficult to realize that it was not a church court at all, much less a form of Presbyterianism.

It was a council created by parliament to give advice in church matters at a great crisis in the nation's history; but its acts, though from the high character and great learning of its members worthy of deep respect, did not as a parliament or church court decide any questions. It was, in a very real sense, representative of the whole country, as two members were chosen by parliament from each county. The number summoned was 151, viz. ten lords, twenty members of the House of Commons, and sixty-six other ordained ministers. The members were mostly Puritans; by their ordination, &c., Episcopalian; and for the most part strongly impressed with the desirability of nearer agreement with the Church of Scotland, and other branches of the Reformed Church on the Continent. About 180 of those present, and perhaps 250 in all, who were out-and-out Episcopalians did not attend at all. Apart from these, there were three well-defined parties: (1) those with Presbyterian ideas and sympathies, a great majority; (2) those who maintained that Dr John Pilkington, the head of the party, was no Episcopalian; (3) Independents, ten or eleven in number, led by Philip Nye, and assured of Cromwell's support. Then there were the Scottish commissioners who, though without votes, took a leading part in the discussions. The result was that the Westminster Assembly was a failure, a remarkable failure. Episcopacy, Erastianism and Independency, though of little account in the assembly, were to bulk largely in England's history during the reign of Charles II, and the character and views adopted and recommended was to be almost unknown. Judged in other ways, however, the influence of the assembly's labours has been very great. The Confession of Faith and the Larger and Shorter Catechisms, which became the basis of the Presbyterian Church in England, the Church of Scotland, and the Reformed Churches in Europe, are the result of this assembly. Where British Presbyterianism, with its sturdy characteristics, has taken root. And the Directory of Public Worship has shaped and coloured, perhaps too thoroughly, the ritual and atmosphere of our Anglo-Saxon worshippers throughout the world, except Episcopalians.

In 1646 the ordinance establishing Presbyterianism was ratified by both houses of parliament, and a few days afterwards it was ordered to be put into execution. Twelve presbyteries were erected in London; Shropshire and Lancashire were organized; and Bolton was so vigorous in the cause as to gain the name of the Genevans of Lancashire. But the system never took root. Not only were the well-known adverse influences, but the Church of England did not seem to be unconditionally approved with Scotland and England. Presbyterianism had more of the lay element. In every classis or presbytery there were two elders to each minister. The Synod of London met half-yearly from 1647 till 1655. Synods also met in the provinces, and under the Restoration came Episcopacy, and the persecution of all who were not Episcopalians; and the dream and vision of a truly Reformed England, in which the Church might play a part, was a failure.

Presbyterianism in England.

After the Revolution and during the reign of William and Mary the hatred of the Church of England to the Presbyterians and other dissenters had been obliged to lie dormant. With the accession of Anne, who began an anti-episcopal Decade.

Synd of London.

In 1665 the Synod of London met, and was dissolved by a vote of the assembly on account of the dissolution of the empire. It is the last assembly held in England till the Revolution Union of 1689.

In 1689 the union of the Presbyterian Church in England and the English congregations of the United Presbyterian Church of Scotland was brought about. All the congregations (with a few exceptions) into one church, "The Presbyterian Church of England." "What kept these bodies apart was their separate historic origin and development, but especially their national patriotism, which had grown out of the national character, and was not to be dissolved by any effort to establish a presbyterian church in every parish. These proposals were rendered abortive by the unflinching use of the queen's prerogative.

In 1690 Henderson, Baillie, Blair and Gillespie came to London as commissioners from the General Assembly in Scotland, in response to a request from ministers in London who desired to see the Church of England more closely modelled after the Reformed type. They were able men, whose preaching drew great crowds, and increased the desire for the establishment of Presbyterianism.
PRESBYTERIANISM

have been imported principally from Scotland. To English people, therefore, the Presbyterian is still the "Scotch Church," and they are as a whole slow to connect themselves with it. Efforts have been made to counteract this feeling by making the Church more distinctly English. The danger in this direction is that when Presbyterianism is modified far enough to suit the English taste it may be found less acceptable to its more stalwart supporters from beyond the Tweed. Following the lead of the Independents, who set up Mansfield College at Oxford, the Presbyterian and Ulster foundations followed Cambridge as a substitute for its Theological Hall in London. It was opened in 1890 with the view of securing a home-bred ministry more conversant with English academic life and thought.

In Protestantism, in their common explanation of the British Isles, the Presbyterian Church of England has in recent years been readjusting its relation to the Westminster Confession of Faith. Without setting aside the Confession as the church's standard, two explanations of the doctrine have been adopted. In these, no change is alleged, it has been made in regard to the substance of the Westminster doctrine, but there is an alteration of emphasis and proportion.

There are in England fourteen congregations in connection with the Church of Scotland, six of them in London and the remainder in Berwick, Northumberland, Carlisle and Lancashire.

Many Unitarians in England still call themselves Presbyterians. This is explained by a desire to be regarded as the successor from the old English Presbyterians, they retain nothing of their distinctive doctrine or polity—nothing of Presbyterianism, indeed, but the name.

Ireland.

Presbyterianism in Ireland, in modern times at least, dates from the plantation of Ulster in the reign of James I. The infusion of a considerable Scottish element into the population necessitated the formation of a congregational church. The immigrants from England took with them, in like manner, their attachment to the Episcopal Church. But these two sects, in contrast to the presbyterianism of the preponderating Roman Catholicism of the country, seemed at first inclined to draw closer together than had been thought possible in Great Britain. A confession of faith, drawn up by Archbishop Usher at the convocation of 1615, implicitly admitted the validity of Presbyterian ordinance, and denied the distinction between bishop and presbyter. Within the Episcopal Church and supported by its endowments, Robert Blair, John Livingstone and other ministers maintained a Scottish Presbyterian communion.

From 1625 to 1638 the history of Irish Presbyterians is one of bare existence. Their ministers, silenced by Wentworth, after an ineffectual attempt to reach New England, fled to Scotland, and there took a leading part in the great movement of 1638. After the Irish rebellion of 1641 the Protestant interest for a time was ruined. A majority of the Ulster Protestants were Presbyterians, and it was a great revenue from the tax on the profits of the Scottish regiments stationed in Ireland took a leading part. Kirk-sessions were formed in four regiments, and the first regular presbytery was held at Carrickfergus on the 10th of March 1642, attended by five ministers and by ruling elders from the regimental kirk-sessions.

The First Presbytery. The regiments were supplied with ministers to as many congregations as possible; and for the remainder ministers were sent from Scotland. By the end of 1643 the Ulster Church was fairly established. Notwithstanding internal divisions, there were thirty ordained ministers in fixed charges in Ulster besides the chaplains of the Scottish regiments.

At the Restoration, in which they heartily co-operated, there were in Ulster sixty ministers in fixed charges, with eighty-eight parishes or congregations containing one hundred thousand persons. There were five presbyteries holding monthly meetings and annual visitations of all the congregations within their bounds, and coming together in general synod four times a year.

Conformity with the Scottish Church was maintained, and strict discipline was enforced by pastoral visitations, kirk-sessions and presbyteries.

After the Restoration the determination of the government to put down Presbyterianism was speedily felt in Ireland. In 1661 the lords justices forbade all unlawful assemblies, and in these they included meetings of presbytery as exercising ecclesiastical jurisdiction. Under the protection of the army and of the Presbyterians, more forward was the work of persecution. The ministers refused to take the Oath of Supremacy without the qualification suggested by Usher. Their parishes were declared vacant, and episcopal clergy appointed to them. The ejected ministers were forbidden to preach or administer the sacraments. In Ulster thirty-one ministers were ejected. Of seventy only seven conformed. Under Ormonde, in 1665, ministers again permitted to revive Presbyterian worship and discipline, and for several years the Church prospered not only in Ulster but also in the south and west. In 1672 she received a yearly grant from Charles II. of £600 (regium donum), and under William III. the amount was considerably increased. It was continued till 1689.

In 1679 the rising in Scotland which ended in the battle of Bothwell Bridge brought trouble on the Irish Presbyterians in spite of their loyal addresses disowning it. It was not, however, till 1682 that they suffered persecution of a more severe kind. They were severely oppressed. They were opposed to James II., though they had benefited by his Declaration of Indulgence, and they were the first to congratulate the Prince of Orange on his arrival in Ireland. As a minority, they were not able to withstand the power of the protestation. As they were a majority of the population, and some of their ministers rendered conspicuous service. There were then in Ireland about a hundred congregations, seventy-five with settled ministers, under five presbyteries. The preponderance in Ulster and their consciousness of their great service to England led them first of all to hope that Presbyterianism might be substituted for Episcopacy in Ulster, and afterwards, that it might be placed on an equal footing with the latter.

In the 18th century Irish Presbyterianism became infected with Arianism. Under the leadership of Dr Henry Coke, a minister of rare ability and eloquence, the evangelical party triumphed in the church courts, and the Unitarians seceded and became a separate denomination. In 1782 the Synod of Ulster and the Synod of Bermuda was adopted and established the Presbyterian Church in England.

The Presbyterian Church in Ireland is the most conservative of all the Reformed Presbyterian churches in the United Kingdom. Her attitude is one of sturdy adherence to the old paths of evangelical doctrine and Presbyterian polity. She has been a zealous supporter of Irish national education, which is theoretically "uniting secular and religious instruction." The Church Act of 1866, which disestablished and disendowed the Irish Episcopal Church took away the Presbyterian "regium donum." The Irish ministers are the only ministers in the Church of Ireland who are absolute owners of their parishes, and have a great fund for the support of the Church. The communion fund thus formed is a permanent memorial of a generous and disinterested act on the part of her ministry. It amounted in 1902 to £388,028. The interest accruing from it is sufficient to meet the expenses of the Synod and its secretaries and is also a large central fund for ministerial support. Since the state endowment ceased the average income of ministers from their congregations has considerably increased.

The Irish Presbyterian Church has set an example to all her sister churches by her forwardness to care for the poor. Her "Presbyterian Orphan Society" undertakes the support of every poor orphan child throughout the Church. No Presbyterian orphan child now needs to seek workhouse relief. The orphans are educated in the homes of respectable families, and the houses are also open for the benefit of the society. A scheme of pensions for her aged poor has been instituted.

Three small communities of Presbyterians maintain a separate autonomy. In Ireland, the Reformed Presbyterian Church, with thirty-six; the Eastern Reformed, with six; and the Secessive Church, with ten congregations.

Wales.

The Presbyterian Church of Wales, commonly known as the Calvinistic Methodists, had its origin in the great evangelical revival of the 18th century. Its polity has been of gradual growth, and still retains some features peculiar to itself. In its parishes were first presbyterianly ordained and authorized to administer the sacraments. In 1834 a profession of Faith was adopted. In 1864 the two associations or synods of North and South Wales were united in a general assembly. Great attention is given to the education of the ministry, a considerable number of whom, in recent years, have taken arts degrees at Oxford and Cambridge. As far as the difference in language will permit, there is cordial fellowship and co-operation with the Presbyterian Church of England. The appetite of the Welsh people for sermons is enormous, and the preachers are characterized by an exceptionally high order of pulpit power.

United States.

Presbyterianism in the United States is a reproduction and further development of Presbyterianism in Europe. The history of the American Presbyterian churches, excluding the two "Reformed" Churches (see Reformed Church in the United States for the German body, and Reformed Church in America for the Dutch body), may be divided into three periods.

(W. Y.)
1. The Colonial Period.—The earliest Presbyterian emigration consisted of French Huguenots under the auspices of Admiral Coligny, who led a party to Royal, South Carolina, by Jean Ribault in 1622, and to Florida (near the present St Augustine) by René de Laudonnière in 1629. The enterprise was soon abandoned, and the colonists of the latter were massacred by the Spaniards. Under Pierre de Gua, sieur de Monts, Huguenots settled in Nova Scotia in 1604 but did not remain after 1607. Huguenot churches were formed on Staten Island, New York, before 1648; and in Scotland, the Presbyterian church of Monts, in 1688; at Boston, Massachusetts, in 1687; at New Rochelle, New York, in 1688; and at other places. The Charleston church alone of these early churches maintains its independence of any other establishment.

English Puritans emigrated under the auspices of the Virginia Company to the Bermudas in 1612; and in 1617 a Presbyterian church, governed by ministers and four elders, was established there by Lewis. In 1675, the last of the Puritans was expelled from Newfoundland, New Jersey, and Massachusetts. Beginning with 1620, New England was colonized by English Presbyterians of the two types which developed from the discussions of the Westminster Assembly (1643–1648) into Presbyterian and Congregationalism. The Plymouth colony was rather of the Congregational type, and the New England colonists were Presbyterian or Presbyterianized. Presbyterianism was stronger in Connecticut than in Massachusetts. Thence it crossed into the Dutch settlements on the Hudson and the Delaware, and mingled with other elements in Virginia, Maryland, and Pennsylvania. Nineteen Presbyterian churches were established on Long Island between 1640 and 1670—one at Southampton and one at Southold (originally of the Congregational type) in 1640, one at Hempstead about 1644, one at Jamaica in 1646, one at New York (now New York City) in the same century; and three Puritan Presbyterian churches were established in Westchester county, New York, between 1677 and 1685. In New York City, Francis Doughty preached to Puritan Presbyterians in 1643; in 1650 he succeeded John Dows, of Richard Denton (1650–1662). Doughty was succeeded in 1662 by John Westminster, the father of British Presbyterianism in the Middle Colonies. His work in Virginia and Maryland was carried on twenty-five years later by Francis Makemie (d. 1708).

1698. Presbyterianism was carried to America by an unknown Irish minister in 1668. Its foremost representative was Francis Makemie, already mentioned, who, in 1683, as an ordained minister of the presbytery of Laggan, was invited to minister to the Marylanders. In 1687 and 1688, New Hill, near Baltimore, Maryland, was settled; in 1704 he returned to America from a trip to Great Britain, where he had visited the Presbyterians of London, Dublin, and Glasgow in the American churches, and brought back with him two ordained ministers—John Hampton (d. 1721) and George McNish (1660–1723)—who organized the first Presbyterian church in New York City for preaching without licence, but was acquainted in 1708.

To the banks of the Delaware the clergy of New England sent missionaries: Benjamin Woodbridge went to Philadelphia in 1668 and was followed immediately by Jedediah Andrews (1674–1746), who was ordained in 1701, and under whom the first Presbyterian church in Philadelphia was organized; in 1698 John Wilson (d. 1712) became pastor of a Presbyterian Church at New Castle, Delaware; Samuel Davis (d. 1725) had preached as early as 1692 at Lewes, Delaware, and Nathaniel Taylor (d. 1710) was another of the New England missionaries along the Delaware river and bay. About 1695 Thomas Bridge, with Presbyterians from New England, came to connect with the church at New Castle, in West Jersey. These New England ministers in the Delaware, with Francis Makemie as moderator, organized in 1706 the first American presbytery, the presbytery of Philadelphia. In 1716 this presbytery became a synod by dividing itself into four "subordinate" presbyteries: the northern was Junction, the eastern was Scotch, the western was Delaware, and the southern was "Dunagall." (Donegal) was established in Lancaster county, Pennsylvania.

The parties had developed with the growth of the Church. The stricter party urged the adoption of the Westminster standards and conformity thereto; the broader party was unwilling to sacrifice their liberty. The former followed the model of the Church of Scotland; the liberal party sympathized with the London and Dublin Presbyterians. The two parties united in 1729, which adopted the Westminster symbols "as being, in all the essential and necessary articles, good forms of sound words and systems of Christian doctrine." This adopting act allowed scruples as to "articles not essential and necessary in doctrine, worship or government"—the presbytery being judge in the case and not the subscriber. In 1730–1732 the stricter party in the presbyteries of New Castle and Donegal insisted on full subscription. In 1746, in the presbytery of Allentown, they were adopting act according to their own views. The liberals put themselves on guard against the plotting of the other side. Friction was increased by a contest between Gilbert Tennent and his friends, and the Reverend Robert Rutherford, the former of Watts's Psalms; he had grown to two presbyteries and thirteen...
ministers in 1776. The Burgher Synod in 1764 sent Thomas Clarke of Ballyare, Ireland, who settled at Salem, Washington county, New York, and in 1776 sent David Telfair, of Montoelie, Scotland, who preached in Philadelphia; they united with the Associate Presbytery in Pennsylvania as to 1771. This Synod ordered the presbytery to annul its union with the Burghers, and although Dr Clarke of Salem remained in the Associate Presbytery, the Burgher ministers who immigrated later joined the Associate Reformed Church. In 1769-1772, there was a futile attempt to secure the union of the Associate Presbytery with the main American Church.

2. From the War of Independence to the Civil War.—During the War of Independence the Presbyterian churches suffered severely. Ministers and people with few exceptions—the most notable being the Scotch Highlanders who had settled in the valley of the Mohawk in New York and on Cape Fear river in North Carolina—sided with the patriot or Whig party: John Witherspoon was the only clergyman in the Continental Congress of 1776, and was otherwise a prominent leader; John Murray of the Presbytery of the Eastward was an eloquent leader in New England; and in the South the Scotch-Irish were the backbone of the American partisan forces, two of whose leaders, Daniel Morgan and Andrew Pickens, were Presbyterian elders.

At the close of the War the Presbyterian bodies began at once to reconstruct themselves. In 1782 the presbyteries of the Associate and Reformed churches united, forming the Associate and Reformed Presbyterian Synod. A large number of Church members were the result of this reunion. The differences in both bodies the older Associate and Reformed Presbyteries remained as separate units—the Associate Presbytery continued to exist under the same name until 1801, when it became the Associate Synod of North America; in 1818 it ceased to be subordinate to the Scotch General Synod. The Associate Reformed Synod added in 1794 a fourth presbytery, that of Londonerry, containing most of the New England churches, but in 1801 “disclaimed” this presbytery because it did not take a sufficiently strict view of the question of psalm-singing. The Reformed Presbytery of North America was reconstituted by two ministers from Ireland in 1798; it became a synod of three presbyteries in 1800 and a general synod in 1825; in the first decade of the century the presbytery required all members to free their slaves. The synod of New York and Philadelphia, which in 1781 had organized the presbytery of Redstone, the first of western Pennsylvania, in 1783 resolved itself into a General Assembly, which first met in Philadelphia in 1789, and after revising the chapters on church discipline and synodical in the constitutions, “containing the system of doctrine taught in the Holy Scriptures,” and they made them unalterable without the consent of two-thirds of the presbyteries and the General Assembly. In 1801 a “plan of union” proposed by the General Association (Congregational) of Connecticut was accepted by the General Assembly, and the work of home missions in the western section of the country was prosecuted jointly. The result was mixed churches in western New York and the new states west of the Alleghany Mountains, which grew into presbyteries and synods having peculiar features midway between Presbyterianism and Congregationalism.

The general strictness of the church in its requirements for ministerial education occasions it great loss in this period when the territory beyond the Appalachians was being settled so largely by Scotch-Irish and Presbyterians. The extent of the movement brought about differences which resulted in the high-handed exclusion of the revivalists. These formed themselves into the presbytery of Cumberland, on the 4th of February 1810, which grew in 1813 into a synod of three presbyteries and a General Assembly, the Cumberland Presbyterian Church. In 1813 they revised the Westminster Confession and excluded, as they claimed, fatalism and infant damnation. If they had appealed to the General Assembly they might have received justice, or perhaps it happened that the members had been under the influence of John Mitchell Mason (1770-1829), the Associate Reformed Synod combined with the General Assembly of the Presbyterian Church, but the majority was too slender to make the union thorough. The greater part of the ministers decided to remain separate, and accordingly organized three independent synods—New York, Scioto and the Carolinas. In 1858 the associate synods of the north and west united with the Associate Synod as the United Presbyterian Church. In 1833 the Reformed Presbyterian Church divided into New Lights and Old Lights in a dispute as to the propriety of Covenanters exercising the rights of citizenship under the constitution of the United States.

The separation of the southern part of the Associate Reformed Church from the northern in 1821, and the establishment of the Associate Reformed Synod of the South had not been due to slavery, but was for convenience in administration.

The "sides" remained separate throughout the remainder of this period. The North was especially agitated by the slavery question. In 1847 the synod of the Free Presbyterian Church was divided into the "north" and "south" synods, under the moderator John Ripley, O. (New School), and a part of the presbytery of Mahoning, Pa. (Old School); this synod, then numbering five presbyteries with 43 ministers, joined the New School Assembly during the Civil War. In 1850 the New School Assembly declared slave-holding, unless slavery was for "the purpose of self-support". In 1853 it asked the Southern presbytery to report what action they had taken to put themselves in accord with the resolution of 1850. The answer was: "We are a Slavery Church."

PRESBYTERIANISM

In 1858, 6 synods, 21 presbyteries and about 15,000 communicants withdrew and organized the United Synod. Just before the outbreak of the Civil War in 1861 these churches numbered:—

3. Since the beginning of the Civil War.—The Southern presbyteries of the Old School Assembly withdrew in 1861, and delegates from ten southern synods (47 presbyteries) met in Augusta, Georgia, in December, and organized as the General Assembly of the Presbyterian Church in the Confederate States of America, which included 700 ministers, 1000 churches and 75,000 communicants. Its strength was increased by the addition: in 1863 of the small Independent Presbyterian Church of South Carolina; in 1865 of the United Synod (New School), which at that time had 120 ministers, 150 churches, and 12,000 communicants; in 1867 of the presbytery of Patapoco; in 1869 of the synod of Kentuck; and in 1874 of the synod of Missouri. At the close of the Civil War this Southern Church adopted the name of the General Assembly of the Presbyterian Church in the United States.

In 1867 there was an unsuccessful attempt to combine all the Presbyterian bodies of the North. In 1869 the Old and New Schools in the North combined on the basis of the common standards; to commemorate the union a memorial fund was raised which amounted in 1871 to $7,607,492. Between 1870 and 1881 three presbyteries of the Reformed Presbyterian General Synod (in Ohio & Indiana) united with the northern General Assembly. In 1906 the greater part of the Cumberland Presbyterian Church (then having 105,770 members) united with the northern General Assembly. Although the difference of opinion on the old school and New School question had disappeared in 1869 than in 1837 during the separation the New School was conservative, the Old School liberal, in tendency—there were serious divisions in the northern church after the union. The first of these united presbyteries was that of 1855 by the adoption by certain teachers in theology of the Seminaries of the methods and results of the "higher criticism," and two famous heresy cases followed. Charles Augustus Briggs, tried for heresy for his inaugural address in 1851 as professor of biblical theology at Union Seminary (in which he attacked the inerrancy of the Bible, held the composite character of the Hexateuch and of the Book of Isaiah and taught that sanctification is not complete at death), was acquitted by the presbytery of New York, but was declared to be a heretic and was suspended from his teaching duties by the General Assembly in 1853. Henry Preserved Smith, professor of Hebrew and Old Testament exegesis in Lane Seminary, for a pamphlet published in 1851 denying the inerrancy but affirming the inspiration of the Bible, was suspended from his teaching duties by the presbytery of Cincinnati, and was unsuccessful in his appeal to the synod and to the General Assembly. Dr Briggs remained a member of the Union Seminary faculty but left the Presbyterian Church to enter the Episcopal Protestant. Dr Smith resigned his chair at Lane Seminary, and entered the Congregational ministry. In 1892-1893 there was an open break between the General Assembly and Union Seminary, which repudiated the agreement of 1870 between the seminary and the assembly; this agreement provided for the seminary's teachings and withheld financial aid from its students. In 1896 McCormick Theological Seminary (which in 1858 as New Albany Theological Seminary had come under the control of the assembly) and Auburn Seminary refused to make the changes demanded by the General Assembly, and an arrangement with McCormick was made. Lane and Auburn remained practically independent.

But although the conservative party was successful in inducing some Presbyterian seminaries to stress more strongly the verbal inerrancy of Holy Scripture and to make belief in such inerrancy a requisite of teachers in theological seminaries and of candidates for the ministry, there was in other matters an increasing disagreement. In 1902 the General Synod of the Reformed Presbyterian Church (United States) issued a Brief Statement of the Reformed Faith, not as a legal standard but as an interpretation of the confession; it repudiated the doctrine of infant damnation, insisted on the consistency of predestination with foreknowledge, the necessity of regeneration, the love of God, and missions. The Assembly of 1906 authorized (but did not make mandatory) the use of a book of common worship; the question of a liturgy had been opened in 1875 by C. W. Baird's Eutaxisi; in 1864 Charles W. Shields (1825-1900), who afterwards entered the Protestant Episcopal Church, republished and urged the adoption of the Book of Common Prayer as amended by the Westminster Divines in the royal commission on the church of 1661. Professor C. H. Currie has been prominent in the latter stage of the movement for a liturgy.

The northern General Assembly and the Cumberland Church, which united with it in 1906, are the only Presbyterians in America that have done anything tangible for Christian union in the last fifty years: the southern Assembly is much more conservative than the northern—in 1866 it suspended James Woodrow (1822-1907), professor of natural science in connexion with revealed religion, for holding evolutionary views, and it declared that Adam's body was "directly fashioned by Almighty God, without any natural animal parentage of any kind, out of matter previously created out of nothing"; and in 1897 it ordered that women were not to speak in public meetings—and its attitude toward the negro, insisting in separate church organizations for blacks and whites, makes union with the northern bodies difficult; the United Presbyterian Church in North America in 1890 refused to join the union of Presbyterian and Reformed missions in India, and its opposition to instrumental music and to the use of any songs but the psalms of the Old Testament, although this is decreasing in strength, bears to-day the stamp of the Reformed Presbyterian Church of North America. In 1888 refused to unite with the United Presbyterian Church because the latter did not object to the secular character of the constitution of the United States; and with the general synod of the Reformed Presbyterian Church the synod could not unite in 1890 because the general synod allowed and the synod did not allow its members to "incorporate" themselves with the political system of the United States. A loose union, called the "Federal Council of the Reformed Churches in America," was formed in 1894 by the churches mentioned (excepting the Southern Assembly) and the Dutch and German Reformed churches.

More or less closely connected with the Northern Church are the theological seminaries at Princeton, Auburn, Philadelphia (former Allegheny—the Western Seminary), Cincinnati (Lane), New York (Union, Chicago (McCormick), already named, in 1857), San Francisco (Presbyterian) (1851) since 1892 at San Anselmo, Cal., a theological seminary (1851) at Omaha, Nebraska, a German theological seminary (1869) at Bloomfield, New Jersey, the German Presbyterian theological seminary at Händel, Tennessee, (1852) at Dubuque, Iowa, and the Presbyterian Theological Seminary and College at Kentucky, which is under the control and supervision of the northern and southern seminaries. Seminaries of the United Church are the Theological Seminary at Richmond, Virginia, and the Columbia Theological Seminary at Columbia, South Carolina. The East Tennessee Theological Seminary, already mentioned, the Austin Presbyterian Theological Seminary (1902) at Austin, Texas, the theological department in the southwestern Presbyterian University at Clarksville, Tennessee, and, for negroes, Stillman Institute (1877), at Tuskegee, Ala. The United Presbyterian Church has two seminaries, one at Xenia, Ohio, and one at Allegheny (Pittsburg). Of the Covenanters bodies the synod of the Reformed Presbyterian Church has a theological seminary in Allegheny (Pittsburg), established in 1856; C. E. Woodrow was the general synod in 1887 organized a college at Cedarville, Ohio. The Associate Reformed Synod of the South has the Erskine Theological Seminary (1837) in Due West, South Carolina.

The foreign missions department of the Presbytery Assembly had been carried on after 1812 through the (Congregational) American Board of Commissioners for Foreign Missions (organized in 1810) until the separation of 1837, when the Old School Board established its own board of foreign missions. The old American Board was refused to work through the American board; after the union of 1869 the separate board was perpetuated and the American board transferred to it, with the contributions made to the American board by the United Synod. The American Board of Foreign Missions was organized in 1811 and 1812, and in Persia (1835). The Church now, besides these missions, others in India (1834), Siam (1840), China (1846), Colombia (1856), Brazil (1859), Japan (1859), Laos (1867), Mexico (transferred to the American Board), the Andes of Chili (transferred in 1873 by the same Board; first established in 1845), Guatemala (1882), Korea (1884) and the Philippine Islands (1869). A board of home missions was organized in 1816; a board of education in 1819; a women's board of foreign missions in 1866; a women's executive committee for home missions (which takes particular interest in the work for the freedmen) in 1878; a board of publication in 1838 (after 1887 called the board of Publication and Sunday School Work); a board of aid for colleges
PRESBYTERY—

(1883): a board of church erection in 1844; a board of work for freedmen; and a board of ministerial relief; after the union of 1869 the Board of Home Missions was removed from Philadelphia to New York City.

The Southern Church, unlike the Northern, is not working through “boards,” but through executive committees, which were formerly more loosely organized, and which left to the presbyteries the more direct control of their activities, but which now differ little from the presbyteries at the North. The Presbyterian Church (U.S.A.) has an executive committee on foreign missions (first definitely organized by the Assembly in 1877), which has missions in China (1867), Brazil (1869), Mexico (1874), Japan (1885), Congo Free State (1891), Korea (1891), and New Guinea (1893). The missions of 1865, of publication and Sabbath school work, of ministerial education and relief, of schools and colleges and of colored evangelization (formed in 1891). Permanent committees on the “sabbath schools” and “evangelistic work” report to the General Assembly annually.

The United Presbyterian Church has a board of foreign missions (reorganized in 1859) with missions in Egypt (1853), now a synod with four presbyteries (in 1909, 71 congregations, 70 ministers and 10,341 members), in the Punjab (1854), now a synod with four presbyteries (in 1909, 35 congregations, 51 ministers and 17,321 members), and in the Sudan (1901); and boards of home missions (reorganized, 1859), church extension (1850), publication (1859), education (1859), ministerial relief (1862), and missions to the freedmen (1863).

Presbyterians of different churches in the United States in 1906 numbered 8,303,555; of this total 322,542 were in Pennsylvania, where there were 248,335 members of the Presbyterian Church in the United States of America (the Northern Church), being more than one-fifth of its total membership; 56,587 members of the United Presbyterian Church of North America, being more than two-fifths of its total membership; 2,079 members of the Synod of the Reformed Presbyterian Church of the North America, three-tenths of its total membership; the entire membership of the Reformed Presbyterian Church in the United States and Canada (440), 315 members of the Welsh Calvinistic Methodist Church, nearly one-fourth of its total membership; and 265 members of the Reformed Presbyterian Church in North America, general synod, about five-ninths of its total membership. The strength of the Church in Pennsylvania is largely due to the Scotch-Irish settlements in that state.

Philadelphia is the home of the boards of publication and of Sunday schools of the Northern Church; and in Allegheny (Pittsburg) are the principal theological seminaries of the United Presbyterian body and its publishing house. In New York state there were 199,923 Presbyterians, of whom 186,278 were members of the Northern Church and 10,115 of the United Presbyterian Church of North America. In Ohio there were 135,768 Presbyterians, 1,14,722 being of the Northern and 88,336 of the United Presbyterian Church of North America, nearly one-third of its total membership. The other states in which population is one-fifth of the total membership were Illinois (115,022; 86,251 of the Northern Church; 17,208 of the Cumberland Church; 9555 of the United Presbyterian Church); New Jersey (70,812; 78,490 of the Northern Church); Tennessee (70,337; 42,446 being Cumberland Presbyterians, more than one-fifth of the total membership; 66,40 of the Cumberland Church, more than one-third of its membership; 21,300 of the Southern Church; and 6786 of the Northern Church); Missouri (71,050; 28,637 of the Cumberland Church; 25,901 of the Northern Church; 14,713 of the Northern Church; Texas (62,090; 31,598 of the Cumberland Church; 23,034 of the Southern Church; 418 of the Northern Church; and 2091 of the Cumberland Church); Iowa (60,081; 48,326 of the Northern Church; 8890 of the United Presbyterian Church); and North Carolina (55,877; 41,329 of the Southern and 14,666 of the Cumberland Church). The Northern Church had a total membership of 1,779,566. The Southern Church had a total membership of 266,345. The Cumberland Presbyterian Church had (in 1906, when it became a part of the Northern Church) 195,770 members. The Colored Cumberland Church had a membership of 18,066. The United Presbyterian Church of North America had a total membership of 130,422. The Welsh Calvinistic Methodist Church had a total membership of 13,280. The Associate Reformed Synod of the South had a membership of 13,201. The Synod of the Reformed Presbyterian Church in North America had in 1906 a membership of 1,012.

The “Reformed Presbyterian Church in North America, General Synod,” had a membership of 3620. The Associate Presbyterian Church, or Associated Synod of North America had a membership of 586. The Reformed Presbyterian Church in the United States and Canada had a membership in the United States of 440.

On American Presbyterianism, see Charles Hodge, Constitutional History of the Presbyterian Church in the United States of America, 1706–1788 (2 vols., Philadelphia, 1839–1840); Records of the Presbytery of the United States, 1738–1876 (St. Louis, 1876); W. W. B. Allen, History of the Presbyterian Church in America (1873); J. H. Chalmers, History of the Presbyterian Church in America (1870); W. H. Gilmour, History of the Presbyterian Church in America (1874). There are several bibliographies of the American Presbyterian press. There is a good bibliography on pp. xi–xiii of R. E. Thompson’s History of the Presbyterian Churches in the United States (ibid., 1895), vol. vi. of the American Church History Series; in the same series in vol. xi. are sketches of “The United Presbyterians,” by J. B. Schroeder, “The Cumberland Presbyterians,” by R. N. Foster, and “The Southern Presbyterians,” by Thomas C. Johnson. Other works on the separate churches are: E. B. Crisman, Origin and Doctrines of the Cumberland Presbyterian Church (St. Louis, 1877) and W. M. Glasgow, History of the Reformed Presbyterian Church in America (Baltimore, 1888).

PRESBYTERY, in architecture, that portion of the choir of a church in which the high altar is placed, and which is generally raised by a few steps above the rest of the church. It is reserved for the priests, and in that respect differs from the choir, the stalls in which are occasionally occupied by the laity.

In Westminster Abbey the space east of the transept is the presbytery, and the same arrangement is found in Canterbury Cathedral. In San Clemente at Rome the presbytery is enclosed with a marble balustrade or screen. For the use of the word “church” government see PRESBYTERY and PRESBYTERIANISM.

PREScotT, a market town and urban district in the Ormskirk parliamentary division of Lancashire, England, 8 m. E. of Liverpool by the London & North Western railway. Pop. (1901), 7855. It is of considerable antiquity, and received a grant for a market and fair in the 7th year of Edward III. A church existed in the 13th century. The present church of St Mary is in various styles, with a lofty tower and spire and carved timber roof. The chief industry is the making of watches, and the town has long been celebrated for the production of watch movements and tools. The industry was first introduced in 1730 by John Miller from Yorkshire. There is also a manufacture of electric cables. John Philip Kemble, the actor, was born at Prescott in 1757. To the north of the town is Knowsley Park, the demesne of the earls of Derby, with a mansion of various dates from the 13th century onward, containing a fine collection of furniture. Prescott was formerly of greater importance in relation to the now populous district of south-west Lancashire; it was also a postal centre, and it is curious to notice that such addresses as “Liverpool, near Prescott” were necessary.

PREScott, WiLLiAM HICKLING (1766–1839), American historian, was born in Salem, Massachusetts, on the 4th of May 1766. His grandfather was Colonel William Prescott (1726–1765), who commanded at the battle of Bunker Hill; and his father was a well-known lawyer. He received his earlier education in his native city, until the removal of his family in 1808 to Boston. He entered Harvard College in the autumn of 1811, but almost at the outset his career was interrupted by an accident which affected the subsequent course of his life. A hard piece of bread, flung at random in the Commons Hall, struck his left eye and destroyed the sight. After graduating honourably in 1812 he entered his father’s office as a student of law; but in January 1815 the uninjured eye showed dangerous symptoms of inflammation. While at last in the autumn he was in condition to travel, it was determined that he should pass the winter at St Michael’s and in the spring obtain medical advice in Europe. His visit to the Azores, which was constantly broken by confinement to a darkened room, is chiefly noteworthy from the fact that he there began the mental discipline which enabled him to compose and retain in memory long passages for subsequent dictation; and, apart from the gain in culture, his journey
PRESCOTT

suddenly found himself elevated to the first rank of contemporary historians.

After coquetting for a short time with the project of a life of Molière he decided to follow in the track of his first work with a *History of the Conquest of Mexico*. Washington Irving, who had already made preparations to occupy the same field, generously withdrew in his favour. The work was completed in August 1843, the five years' labour having been broken by the composition of reviews of Lockhart's *Life of Scott* (1838), Kenyon's *Poems* (1839), Chateaubriand (1839), Bancroft's *United States* (1841), Mariotti's *Italy* (1842), and Madame Calderon's *Life in Mexico* (1843), and by the preparation of an abridgment of his *Ferdinand and Isabella* in anticipation of its threatened abridgment by another hand. On the 6th of December 1843 the *Conquest of Mexico* was published with a success proportionate to a wide reputation won by his previous work. The careful methods of work which he had adopted from the outset had borne a work of such magnitude. What the occupying himself in the past had been no less thorough, his style had become more free and less self-conscious; and the epic qualities of the theme were such as to call forth in the highest degree his powers of picturesque narration.

It was only a step from the conquest of Mexico to that of Peru, and scarcely three months elapsed before he began to break ground on the latter subject. In February 1845 he received the announcement of his election as corresponding member of the French Institute in place of the Spanish historian Navarrete, and also of the Royal Society of Berlin. The winter found him arranging for the publication in England of the selection from his articles and reviews which appeared in 1845, under the title of *Critical and Historical Essays*, and was issued almost contemporaneously at New York under the title of *Biographical and Critical Miscellaneous*. The *Conquest of Peru* was completed in November 1846 and published in March 1847. His biographies as to their reception were at once set at rest, and it was speedily issued in translations into French, Spanish, German and Dutch, in addition to the English editions of New York, London and Paris.

He was now over fifty and his sight showed serious symptoms of enfeeblement. Although during the composition of the *Ferdinand and Isabella* it had been of very intermittent service to him, it had so far improved that he could read with a certain amount of regularity during the writing of the *Conquest of Mexico*, and also, though in a less degree, during the years devoted to the *Conquest of Peru*. Now, however, the use of his remaining eye had been reduced to an hour a day, divided into portions at wide intervals, and he was driven to the conclusion that whatever plans he made must be formed on the same calculations as those of a blind man. He had been for many years collecting materials for a history of Philip II., but he hesitated for some time to attempt a work of such magnitude. While the occupying himself in the meantime with the lighter labours of a memoir of John Pickering for the Massachusetts Historical Society and the revision of Ticknor's *History of Spanish Literature*. But in March 1848 he set himself with characteristic courage to the accomplishment of the larger project. He had been fortunate in obtaining the aid of Don Pascual de Gayangos, then professor of Arabic literature at Madrid, by whose offices he was enabled to obtain material not only from the public archives of Spain but from the muniment rooms of the great Spanish families. With an exceptional range of information thus afforded him, he wrote the opening of his history in July 1849; but, finding himself still unsettled in his work, he decided in the spring of the following year to carry out a long projected visit to England. The idea of writing memoirs was dismissed in favour of the more elaborate form, and in November 1855 the first two volumes of his uncompleted *History of Philip II.* were issued from the press, their sale eclipsing that of any of his earlier books. This was his last great undertaking; but as Robertson's *Charles V.*, in the light of new sources of information, was inadequate to take its place as a link in the series, he republished it in an improved and extended form in December 1856. A slight attack of

to England, France, and Italy (April 1816 to July 1817) was scarcely satisfactory. The verdict of the physicians was that the injured eye was hopelessly paralysed, and that the preservation of the sight of the other depended upon the maintenance of his general health. His further pursuit of the legal profession seemed to be out of the question, and on his return to Boston he remained quietly at home. On 4th May 1820 he was married to Miss Susan Amory. Prior to his marriage he had made a few experiments in composition, but he now finally decided to devote his life to literature. A review of Byron's *Letters on Pope* in 1821 constituted his first contribution to the *North American Review*, to which he continued for many years to send the results of his lighter researches. He next turned to French literature, and to the early English drama and ballad literature. Of the direction and quality of his thought at this time he has left indications in his papers on *Essay-Writing* (1822) and on *French and English Tragedy* (1823). In pursuance of his method of successive studies he began in 1825 the study of Italian literature, passing over German as demanding more labour than he could afford. In the following year he made his first acquaintance with the literature of Spain under the influence of his friend and biographer, Ticknor; and, while its attractiveness proved greater than he had at the outset anticipated, the comparative novelty of the subject as a field for research served as an additional stimulus.

In the meantime his aims had been gradually concentrating. History had always been a favourite study with him, and Mably's *Observations sur l'Histoire* appears to have had considerable influence in determining him to the choice of some special period for historic research. The selection, however, was not finally made without prolonged hesitation. It was not till the 19th of January 1826 that he recorded in the private memoranda begun by him in 1820 his decision "to embrace the gift of the Spanish subject." The choice was certainly a bold one. He could not but feel that the eye which remained for him for brief and intermittent periods, and as travelling affected his sight prejudicially he could not anticipate any personal research amongst unpublished records and historic scenes. He was happy, however, in the possession of ample means and amiable friends; and he sketched with no undue restriction or hesitancy the plan of the *History of the reigned Ferdinand and Isabella*—his first great work. Mr English, one of his secretaries, has furnished a picture of him at this period seated in a study lined on two sides with books and darkened by green screens and curtains of blue muslin, which required readjustment with almost every cloud that passed across the sky. His writing apparatus—a noctograph—lay before him, and he kept his ivory style in his hand to jot down notes as the reading progressed. In accordance with his general method these notes were in turn read over to him until he had completely mastered them, when they were worked up in his memory to their final shape. So proficient did he become that he was able to retain the equivalent of sixty pages of printed matter in his memory, turning and returning them as he walked or drove. The rate of progress was necessarily slow, apart from any liability to interruption by other undertakings and failures in bodily health. He still continued his yearly experimental contributions to the *North American Review*, elaborating them with a view as much to ultimate historical proficiency as to immediate literary effect, the essays on *Scottish Song* (1836), *Novelette* (1827), *Molière* (1828), and Irving's *Granada* (1829) belonging to this preparatory period. On the 6th of October 1829 he began the actual work of composition, which was continued without more serious interruptions than those occasioned by the essays on *Asylums for the Blind* (1830), *Poetry and Romance of the Italians* (1831), and *English Literature of the 16th Century* (1832), until the 25th of June 1836, when the concluding note was written. Another year, during which his essay on *Cervantes* appeared, was spent in the final revision of the *History for the press*. Its success upon its publication in Boston was immediate. Arrangements were speedily made for its publication in England, and there its success was not less marked. From the position of an obscure reviewer Prescott
apoplexy on the 4th of February 1858 foretold the end, though he persevered with the preparation of the third volume of *Philip II.* and the republishing of his *Conquest of Mexico.* On the morning of the 27th of January 1859 a second attack occurred, and he died in the afternoon of the same day in his sixty-third year.

As an historian Prescott stands in the direct line of literary descent from Robertson, whose influence is clearly discernible both in his method and style. But, while Robertson was in some measure the initial father of the science of the modern historian, Prescott, who worked in a more comprehensive field of information was incomparably wider and when progress in sociologic theory had thrown innumerable convergent lights upon the progress of events. He worked, therefore, upon more assured ground, his sittings of authorities was more thorough, his methods less restricted. At the same time he cannot be classed as in the highest sense a philosophic historian. His power lies chiefly in the clear grasp of fact, in selection and synthesis, in the vivid narration of incident. For extended analysis he has small liking and faculty; his comment, therefore, is often dry and he confines himself almost wholly to the concrete elements of history. When he does venture upon more abstract criticism his standards are often commonplace and superficial, and the world scheme to which he relates events is less profound than the thought of his time altogether warranted. Moreover, the authorities on whom he relied had to be corrected since in many points of detail in the light of later archaeological research. If these things, however, indicate Prescott's deficiencies from the ideal of the philosophic historian, they also indicate a higher degree that artistic feeling in the broad arrangement of materials which ensures popular interest. The course of his narrative is unperplexed by doubtful or insoluble problems. The painting is filled with minute observations and his hand; to a man of crudity which may be awoken by close inspection is compensated by the vigour and massive effectiveness of the whole.

Prescott's works in 16 vols. were edited by J. F. Kirk in 1870-1874. His works were revised and reissued in 1885. There are later lives by R. Ogden (1904) and H. T. Peck (1905).

**PRESCRIPTION**, in the broadest sense, the acquisition or extinction of rights by lapse of time. The term is derived from the *praescriptio* of Roman law, originally a matter of procedure, a clause inserted before the *formula* on behalf of either the plaintiff or, in early times, the defendant, limiting the question at issue. It was so called from its preceding the *formula.* One of the defendant's *praescriptiores* was longi *temporis* or longae *possessionis* *praescriptio* (afterwards superseded by the *exceptio*), limiting the question to the fact of possession without interruption by the defendant for a certain time. It seems to have been introduced by the praeator to meet cases affecting aliens or lands out of Italy where the *usuacapio* of the civil law (the original means of curing a defect of title by lapse of time) could not apply. The time of acquisition by *usuacapio* was fixed by the Twelve Tables at one year for movables and two years for immovables. *Praescriptio* thus constituted a kind of praetorian *usuacapio.* In the time of Justinian *usuacapio* and *praescriptio* (called also small *temporis* possessio), as far as they are based upon a notion of ownership, differed only in name, *usuacapio* being looked at from the point of view of property, *praescriptio* from the point of view of pleading. By the legislation of Justinian movables were acquired by three years' possession, immovables by ten years' possession where the parties had their domicile in the same province (inter *praesentia*), twenty years' possession where they were domiciled in different provinces (inter *absentia*).

Servitudes could not be acquired by *usuacapio* proper, but were said to be acquired by quasi *usuacapio,* probably in the same time as sufficed to give a title to immovables. There was also a *longissimi* *temporis possessio* of thirty years, applicable to both movables and immovables, and requiring nothing but *bona fides* on the part of the possessor. Where the right sought to be established was claimed against the Church, a still longer period of forty years (at one time a hundred) was necessary. Immemorial prescription was required in a few cases of a public character, as roads. *Praescriptio* was also the term applied to lapse of time as barring actions upon contracts or torts under various provisions corresponding to the English Statutes of Limitations.

The prescription of Roman law (and of modern lawyers) is thus both accumulative and extinctive. It looks either to the length of time during which the defendant has been in possession, or to the length of time during which the plaintiff has claims to possession. In English law the latter kind of prescription is called limitation. The tendency of laws is to substitute a definite for an indefinite period of prescription.

In English law prescription is used in a comparatively narrow sense, and is acquired only, and is very limited in its application. A title by prescription can be made only to incorporeal hereditaments—that is, in legal language, hereditaments that are or have been appendant or appurtenant to corporeal hereditaments—and to such incorporeal hereditaments as are within the term of prescription for the most part consist of rights in *aiuolo solo.* The most important are advowsons, tithes, commons, ways, watercourses, lights, offices, dignities, franchises, pensions, annuities and rents.

There are two bases of the operation of prescription. The first is the foundation of prescription is the presumption of law that a person found in undisturbed enjoyment of a right did not come into possession by an unlawful act (see Williams, *Rights of Common,* § 3). In the English courts this presumption was, perhaps still is, based upon the fiction of a lost grant, viz. that there had been a grant of the hereditament by a person capable of granting it to a person capable of taking it, and that the grant had been lost. The jury were instructed to find the loss of a once existing grant in whose existence there was no record, but which the defendant had been from a time whereof the memory of man runneth not to the contrary. The period of legal memory was after a time necessarily fixed for purposes of convenience at a certain date. The date of the grant is not, however, expressly fixed. It may be in a writ of right must have proved seisin in himself or his ancestors. After one or two previous encumbrances the date was finally fixed by the Statute of Westminster the First (3 Edw. I. c. 39) at the reign of Edward the Second to which fence the defendant was known to be attached. In Case the reign of Richard I. (1189). The inconvenience of this remote date, as time went on, led to the gradual growth of a rule of evidence that proof of enjoyment for twenty years was prima facie evidence of continued enjoyment for one hundred years, as a result of the new prescription, the *praescriptio* in the nature of a device for the determination of the time of the enjoyment at however remote a date, if subsequent to | Richard I., was sufficient to destroy the claim. This is still the law with respect to claims not falling within the Prescription Act, mostly rights in good of the soil and the public, where the Department of the Crown, e.g. a right to a pew or to a several fishery in a stream. The twenty years' rule was of comparatively late introduction; it does not seem to have been known in the time of Elizabeth, and was perhaps introduced in analogy to the Statute of Limitations, 21 Jac. I. c. 16. There were objections to the *plus longa temporis* of the change which was made by the Prescription Act 1832 (extended to Ireland by an act of 1858, but not to Scotland). By that act claims to rights of common and other prems a prendre are not to be defeated after one hundred years. The enjoyment of a right, without period of prescription for thirty years by showing only the commencement of the right, and after sixty years' enjoyment the right is absolute and indefeasible unless had by consent or agreement by deed or will. which thus in numbers of cases the twenty years' periods are twenty years and forty years respectively (§ 2). The before-mentioned periods are to be deemed those next before suits, and nothing is to be deemed to be an interruption unless acquiesced in for at least one hundred years. The time may be divided in the claimant may be alleged during the period mentioned in the act, and without claiming in the name or right of the owner of the fee (§ 5). No presumption is to be made in favour of a right exercised for a less period (§ 6). The time during which a person otherwise capable of asserting a claim is an infant, idiot, *non compos mentis,* *femor covert,* or tenant for life, or during which an action or suit has been pending until abated by the death of a party, is to be excluded in the computation of the periods unless where the right or claim is declared to have been adverse and the adverse party has been required to find a period of prescription for a modus decimani, or an exemption from tithes by composition, was passed the same year. The Prescription Act is only supplemented to the common law, so that a claim may be based upon the act or, in the absence of the Prescription Act, nor does the act alter the conditions necessary at common law for a good claim by prescription. The claim under the statute must be one which may be lawfully made at common law. The principal rule of prescription, however, is that a prescription must be actual usage. The amount of actual usage and the evidence necessary to prove it vary according to the kind of claim. (2) The enjoyment must (except in the case of light) be as of right—that is to say, peaceably, generally and publicly, and not exercised by the plaintiff must be certain and reasonable. Inhabitants cannot, however, claim by prescription, as they are an uncertain and fluctuating body, unless under a grant from the Crown, which constitutes them a corporation for the purposes of the grant. (4) The prescription must be alleged in a quae estate or in a man and his ancestors. Prescription in a
Que estote lies at common law by reason of continuous and immemorial enjoyment by the claimant, a person seized in fee, and all whose estate he had (fous ceux que estat vit ad). The Prescription Act fixes a definite period and does away with the necessity which existed at common law, to which reference may be made, of proving ownership of the land within three or more years. Now, a prescription is not within the Prescription Act, which applies only where there are dominant and servient tenements. By 32 Hen. VIII. c. 2 (1540) no person can make any prescription by the seisin or possession of such tenement or such seisin or possession has been granted for more than threescore years next before such prescription made. (5) A prescription cannot lie for a thing which cannot be granted, as it rests upon the presumption of a lost grant. Thus a lord of a manor cannot make a prescription to taws, for such a claim could never have been good by any grant. *Prescription and Custom.*—Prescription must be carefully distinguished from custom. Prescription, as has been said, is either in reality a claim to what the law or custom or precedent is to say, it is a personal claim; custom is purely local—that is to say, it is a usage obtaining the force of law within a particular district. In the time of Littleton the difference between prescription and custom was not fully appreciated. The general's tenant could establish his claim to land which existed at present had become established by the time of Sir Edward Coke. A custom must be certain, reasonable and exercised as of right. Like prescription at common law, it must have existed from time immemorial. Custom is not prescribed by any statute sessions for hiring servants was held to be bad, because such sessions were introduced by the Statute of Labourers, 23 Edw. III. st. 1 (Simpson v. Wells, L.R., 7 Q.B., 214: Some rights may be claimed by custom or by prescription; but a right of residents to dwell on a village green, for such a right is not connected with the enjoyment of land. On the other hand, profits à prendre can be claimed by prescription but not by custom, unless in two or three instances, when such custom is held not to be against the lord's demesne, or to dig sain within their tenements, rights to estovers in royal forests, and rights of pounders in Cornwall.

United States.—The law of the United States (except in Louisiana) is not alike that of England, but the period of enjoyment necessary to found a title by prescription varies in the different states. An easement or profit à prendre is acquired by twenty years' enjoyment in most states, following the English common law rule. In Louisiana the prescriptive period is much longer, and the rights other than incorporeal hereditaments may be claimed by prescription as in Roman law (see Kent's Comm. iii. 447).

International Law uses the term "prescription" in its wider or Roman sense. "The general's tenant or a man who has established a principle that long and uninterrupted possession by one nation excludes the claim of every other" (Wheaton, Int. Law, § 165.) Historic instances of rights which were at one time claimed and extinguished by prescription against the nations of Venice over the Adriatic and of Great Britain over the Narrow Seas, and the right to the Sound dues long exacted by Denmark. But such claims were rejected by the highest authorities on international law. Under the principle of *justus titulus* and *de facto possession* there is no special period fixed, as in municipal law, for the acquirement of international rights by lapse of time. In private international law prescription is by no means a regular course of acquiring title.

Scotland.—In the law of Scotland prescriptive rights have been known under the title of prescription and the rules concerning prescription in Scotland are a part of the common law. Prescriptive rights are not very frequent, and are not especially difficult to establish. "In the common law prescriptive rights are acquired by lapse of time, and the nature of possession held by the person adverse to the rights of another. Though having its basis in the common law, its operation was early defined by statute, and it is necessary to determine whether prescription is a mode of acquiring rights—(1) as a mode of acquiring rights—the positive prescription; (2) as a mode of extinguishing rights—the negative prescription; (3) as a mode of limiting rights of action—the shorter prescriptive period. In the former, it is claimed that the distinction between (1) and (2) is rather an accidental (due to a loose interpretation of the language of the act of 1617, c. 12) than a logically accurate one. It is, moreover, strictly confined to heritable rights. In the latter, it is claimed that it is possible to acquire a prescriptive right in addition to other rights. Though the distinction has been complained of by the highest authority as tending to create embarrassment in the law (see opinion of Lord Chancellor St. Leonards in Dougal v. Dunbar Transport Co. [1852, 24 Juris., 368]), it is now too well settled to be departed from.

1. Positive Prescription.—The positive prescription was introduced by the act of 1617, c. 12. After setting forth in the preamble the inconvenience that accrues from the loss of titles and the danger of forgery after the means of impohtation are lost by the lapse of time, it enacts that whatever hertiges the lieges, their predecessors or ancestors have possessed by themselves or others in their names peaceably, in virtue of infeftments for the space of forty years, continually and together, from the date of their said infeftments, and without any lawful interruption during the said space, they shall not be disturbed therein, provided they produce a written title on which their possession has proceeded. Such written title must be dated within thirty years after the alleged forty years, or, within six years, be sealed after the expiration of the thirty years, and be attested by two witnesses. The prescription is a statute remedy, but it is not within the Prescription Act, which applies only where there are dominant and servient tenements. By 32 Hen. VIII. c. 2 (1540) no person can make any prescription by the seisin or possession of such tenement or such seisin or possession has been granted for more than threescore years next before such prescription made. (5) A prescription cannot lie for a thing which cannot be granted, as it rests upon the presumption of a lost grant. Thus a lord of a manor cannot make a prescription to taws, for such a claim could never have been good by any grant. *Prescription and Custom.*—Prescription must be carefully distinguished from custom. Prescription, as has been said, is either in reality a claim to what the law or custom or precedent is to say, it is a personal claim; custom is purely local—that is to say, it is a usage obtaining the force of law within a particular district. In the time of Littleton the difference between prescription and custom was not fully appreciated. The general's tenant could establish his claim to land which existed at present had become established by the time of Sir Edward Coke. A custom must be certain, reasonable and exercised as of right. Like prescription at common law, it must have existed from time immemorial. Custom is not prescribed by any statute sessions for hiring servants was held to be bad, because such sessions were introduced by the Statute of Labourers, 23 Edw. III. st. 1 (Simpson v. Wells, L.R., 7 Q.B., 214: Some rights may be claimed by custom or by prescription; but a right of residents to dwell on a village green, for such a right is not connected with the enjoyment of land. On the other hand, profits à prendre can be claimed by prescription but not by custom, unless in two or three instances, when such custom is held not to be against the lord's demesne, or to dig sain within their tenements, rights to estovers in royal forests, and rights of pounders in Cornwall.

United States.—The law of the United States (except in Louisiana) is not alike that of England, but the period of enjoyment necessary to found a title by prescription varies in the different states. An easement or profit à prendre is acquired by twenty years' enjoyment in most states, following the English common law rule. In Louisiana the prescriptive period is much longer, and the rights other than incorporeal hereditaments may be claimed by prescription as in Roman law (see Kent's Comm. iii. 447).

International Law uses the term "prescription" in its wider or Roman sense. "The general's tenant or a man who has established a principle that long and uninterrupted possession by one nation excludes the claim of every other" (Wheaton, Int. Law, § 165.) Historic instances of rights which were at one time claimed and extinguished by prescription against the nations of Venice over the Adriatic and of Great Britain over the Narrow Seas, and the right to the Sound dues long exacted by Denmark. But such claims were rejected by the highest authorities on international law. Under the principle of *justus titulus* and *de facto possession* there is no special period fixed, as in municipal law, for the acquirement of international rights by lapse of time. In private international law prescription is by no means a regular course of acquiring title.

Scotland.—In the law of Scotland prescriptive rights have been known under the title of prescription and the rules concerning prescription in Scotland are a part of the common law. Prescriptive rights are not very frequent, and are not especially difficult to establish. "In the common law prescriptive rights are acquired by lapse of time, and the nature of possession held by the person adverse to the rights of another. Though having its basis in the common law, its operation was early defined by statute, and it is necessary to determine whether prescription is a mode of acquiring rights—(1) as a mode of acquiring rights—the positive prescription; (2) as a mode of extinguishing rights—the negative prescription; (3) as a mode of limiting rights of action—the shorter prescriptive period. In the former, it is claimed that the distinction between (1) and (2) is rather an accidental (due to a loose interpretation of the language of the act of 1617, c. 12) than a logically accurate one. It is, moreover, strictly confined to heritable rights. In the latter, it is claimed that it is possible to acquire a prescriptive right in addition to other rights. Though the distinction has been complained of by the highest authority as tending to create embarrassment in the law (see opinion of Lord Chancellor St. Leonards in Dougal v. Dunbar Transport Co. [1852, 24 Juris., 368]), it is now too well settled to be departed from.

1. Positive Prescription.—The positive prescription was introduced by the act of 1617, c. 12. After setting forth in the preamble the inconvenience that accrues from the loss of titles and the danger of forgery after the means of impohtation are lost by the lapse of time, it enacts that whatever hertiges the lieges, their predecessors or ancestors have possessed by themselves or others in their names peaceably, in virtue of infeftments for the space of forty years,
the O. Fr. phrase mettre en presence à quelqu'un, to bring something into the presence of a person, to offer. The legal formal phrase "these present" is common, especially in the form "know all men by these presents," as an opening to a deed, more particularly to a deed-poll which cannot be referred to as an "indenture.
The phrase "these present words, documents, writings," &c. is an adaptation of a similar phrase in O.Fr. ces presentes (sc. ettres). As ecclesiastical terms "to present" or "presentation" are used of the "presenting" or nomination by the patron to the bishop of the person chosen by him to fill a vacant benefice. When the bishop is patron he does not "present," but "collates." "Presentation," foreboding, the feeling of something impending, must be distinguished in etymology; it is derived from the Lat. praesentare, to perceive beforehand.

**PRESENTATIONISM** (from Lat. praes-esse, praesens, present), a philosophical term used in various senses deriving from the general sense of the term "presentation." According to G. F. Stout (cf. Manual of Psychology, i. 57), presentations are "whatever constituents or our total experience at any moment directly determine the nature of the object as it is perceived or thought of at that moment." In Baldwin's Dictionary of Philosophy, vol. ii., a presentation is "an object in the special form under which it is cognized at any given moment of perceptual or ideational process." This, the widest definition of the term, due largely to Professor James Ward, thus includes both perceptual and ideational processes. The term has, indeed, been narrowed so as to include ideation, the correlative "representation" being utilized for ideal presentation, but in general the wider use is preferred. When the mind is cognizing an object, the object "presents" itself to the senses or to thought in one of a number of different forms (e.g. a picture is a work of art, a saleable commodity, a representation of a house). Presentation is thus essentially a cognitive process. Hence the most important use of the term "presentationism," which is defined by Ward, in Mind, N.S. (1893), ii. 58, as "a doctrine the gist of which is that all the elements of psychological life are primarily and ultimately cognitive elements." This use takes precedence of two others: (1) that of Hamilton, for presentative as opposed to representative theories of knowledge, and (2) that of some later writers who took it as equivalent to phenomenon (q.v.). Ward traces the doctrine in his sense to Hume, to whom the mind is a "kind of theatre" in which perceptions appear and vanish continually (see Green and Grove edition of the Treatise, i. 334). The main problem is as to whether psychic activity is "presented" or not. Ward holds that it is not presented or presentable save indirectly.

For the problems connected with Presentation and Presentations see especially the article Psychology and authorities there quoted.

**PRESIDENCY**, an administrative unit of the Indian empire. The word is derived from the title of president or chief of the council of a principal factory under the English East India Company—a title which last held the government of a house. It then came to be applied to the three original provinces of Bengal, Madras, and Bombay. It is now restricted to Madras and Bombay, in distinction to the lieutenant-governorships. In Anglo-Indian usage, "presidency" was also applied to the capital city as opposed to the country beyond, termed the "mofussil"; and this usage lingers in such phrases as "presidency town," "presidency magistrate," and "presidency college."

**PRESIDENT** (Fr. president, from Lat. praesidens, post-Augustan Lat. for praeses, director, ruler, from praesidere, to sit in front of, preside), a style or title of various connotation, but always conveying the sense of one who presides. In classical Latin the title praeses, or president, was given to all governors of provinces, but was confined in the time of Diocletian to the procurators who, as lieutenants of the emperor, governed the smaller provinces. In this sense it survived in the middle ages, Du Cange gives instances from the capitularies of Charlemagne of the style praesae provincie as applied to the count; and later examples of praeses, or presidentes, as used of royal seneschals and other officials having jurisdiction under the Crown.

In England the word survived late in this sense of royal lieutenant. Thus, John Cowell, in his Interpreter of Words (1607) defines "President" as "used in Common Law for the King's lieutenant in any province or function; as President of Wales, of York, or of Berwick. President of the King's Council." In some of the British North American colonies (New Hampshire, Pennsylvania, South Carolina) there was a president of the council, usually elected by the council; and when Pennsylvania and New Hampshire became states, one member of the Executive Council was called president. The chief (and single) executive head in Delaware, South Carolina and New Hampshire (1784–1792) was called president.

During the revolutionary struggle in America from 1774 onwards, the presiding officer of the Continental Congress was styled "President," and when the presidet constitution of the United States was framed in 1787 (in effect 1789) the title of President was transferred to the head of the Federal government. "President" thus became the accepted style for the elected chief of a modern republic, the example of the United States being followed by the South American republics, by France in 1849, and by Switzerland.

In the simple sense of "one who presides" the word "president" preserved its meaning alongside the technical use implying royal deputation. In this sense the New English Dictionary quotes its use by John Dryden in 1685, "in the government of England the president was sometimes used for the head of cathedral chapters, instead of dean or provost; and it was sometimes the title given to the principal visitor of monasteries, notably in the reformed congregation of the Jesuits." (Du Cange, Dictionary of the French Language, 1838.) As a style of the followed by the title of many colleges are styled "president," the title being of considerable antiquity in the case of one college at Cambridge (Queens', founded in 1448) and four at Oxford (St John's, Magdalen, Corpus Christi, Trinity). At five Cambridge colleges (Pembroke, Gonville and Caius, St Catherine's, St John's, Magdalen) the title "president" is borne by the second in authority, being the equivalent of "vice-matier. In the United States the "president" is the usual style of United States colleges, and many of these have developed out of a single college. "President" is also the style of persons elected to preside over the meetings of learned, scientific, literary and artistic academies and societies, e.g. the president of the Royal Academy (P.R.A.) in London; the title of the president of the Royal Society (P.R.S) dates from its foundation in 1660. In the United States the style "president" is also given to the person who presides over the proceedings of financial, commercial and industrial corporations, and the corporation, e.g. the Bank of England, the Bank of Scotland, etc., and in Great Britain usually styled "chairman," but in the case of the Bank of England and certain other banks "governor."

In Great Britain the title "president" is also borne by certain offices of the Crown, such as judges, and preserves some of the ancient connotation of a royal lieutenant explained above. Thus the style of "president" is applied to the heads of the board of agriculture, local government board, board of education, board of trade, &c., which are all committees of the privy council, is derived from that of the lord president of the council, the representative of the king. The presidents of the court of session in Scotland, and of the probate and divorce division, &c. in England, also bear this title, sometimes as representatives of the Crown. In France, besides the president of the republic, there are presidents of the senate and of the chamber of deputies. In Germany the word "Präsident" is used in most of the English senses of the word "president," e.g. of a president corporation, etc., as president. As a judicial title "Präsidium" is confined to the head of any one of the corporations (Kollegien) on the basis of which the judicial system of the empire is organized (Landgericht, Oberlandesgericht, Reichsgericht); it must be added that within the Reichsgericht a person also holds the title of president (also presidenten), i.e. the judge who may or may not be the "Präsident" elected to preside over a division of the court appointed to try particular cases.

In Prussia "Präsidium" also retains its old sense of "governor," Oberpräsident being the title of the chief of the administration of a province, President that of the head of a government district (Regierungsbezirke). The consistoryes of the established Protestant Church of Prussia also possess the title of "Präsidium" as an official.

**PRESS** (through Fr. presse, frequentative of presser, i.e. to crush, squeeze, press), a word which appears in English in the 13th and 14th centuries with three particular meanings:

1. The style "president" was in every case exchanged for that of "governor" within a few years of the proclamation of the independence of the United States. The title "president" is no longer used by any government under the British Crown, but relies on past usage to survive in the "presidencies" of Madras and Bombay.
 PRESSBURG—PRESS LAWS

299

meanings, viz. (1) crowd or throng, often used of the mêlée in a battle, (2) a shelved cupboard for books or clothes, and (3) an apparatus for exerting pressure on various substances, and for various purposes. The first meaning is still current, though usually it has a literary air; a specific use is the nautical one of "press of sail," i.e. as much sail as the wind will allow; cf. the similar use of "crowd." The second use has given way to other words, but is still the technical term in use in libraries, where the books bear "press-marks" specifying the case or shelf where they may be found. As a term for a machine or apparatus for exerting pressure, there are innumerable examples, usually with a qualifying word giving the purpose for which the pressure is applied, either for attaining compression into a small space, or a required shape, or for extracting juices or liquids, or the methods adopted for exerting the pressure. The printing-press has given rise to obvious transferred uses of the word "press": thus it is applied to an establishment for printing, e.g. the Clarendon Press, at Oxford, or the Pitt Press, at Cambridge, to a printing house and to the staff which conduct the business, to the issue of printed matter and especially to its daily or periodical issue, hence newspapers and periodicals generally. According to the New English Dictionary this use originated in phrases such as "the liberty of the press," "to write for the press," &c. The earliest quotation given is from the first number of the Dublin Press, 1797. For the history of the liberty or freedom of the press see PRESS LAWS; also NEWSPAPERS and PERIODICALS. For the punishment of "pressing" see PEIN.

PRESSBURG (Hung. Pozsony, Lat. Posonium), a town of Hungary, capital of the county of the same name, 133 m. N.W. of Budapest by rail. Pop. (1900), 64,537, about half of whom are Hungarians. Pressburg is picturesquely situated on the left bank of the Danube, at the base of the outlying spurs of the Little Carpathians, in a position of strategic importance near the Porta Hungarica. Pressburg was the capital of Hungary from 1541 until 1848, while the Hungarian parliament held its sittings here till 1848. One of the most conspicuous buildings of the town is the royal palace, situated on the Schlossberg, a plateau 270 ft. above the Danube, which was destroyed by fire in 1811 and has since been in ruins. Other noteworthy buildings are the cathedral, a Gothic edifice of the 13th century, restored in 1861-1880, in which many of the Hungarian kings were crowned; the town hall, also a 13th-century building, several times restored, and containing an interesting museum; the Franciscan church, dating from 1772; and the law-courts, erected in 1873, where the sittings of parliament were held from 1802 to 1848. The Grassalkowitch palace is now the residence of the archduke, and there is an archiepiscopal palace. Educational establishments include an academy of jurisprudence, a military academy, a Roman Catholic and a Protestant seminary, a training school for female teachers, and several secondary and technical schools. A large business is carried on in wooden furniture, tobacco and cigars, paper, ribbons, leather wares, chemicals, liqueurs, confectionery and biscuits. There is, besides, a dynamite factory, which produces over 2,000,000 lb of explosives annually, a large cloth factory and several flourmills. Trade in grain and wine is active. Besides the extensive traffic on the Danube, the town is also an important railway junction. The first railway line in Hungary was that from Pressburg to Tynnau through the valley of the Waag. The town has many points of interest in its environs. About twenty-five minutes by steamer down the Danube, the extensive ruins of the castle of Theben (Hung. Devény), the former gate of Hungary, are situated at the point where the March, which forms the boundary between Austria and Hungary, falls into the Danube. Opposite on the left bank is Hainburg, the gateway of Hungary from the Austrian side. North and southward of Pressburg stretches a long and fertile plain, known as the Upper or Little Hungarian plain. It has an area of 2835 sq. m., of which two-thirds lay on the right bank of the Danube, and the whole is bounded by the rivers Neutra and Raab. In the extreme south-west of this plain is situated the lake of Fertő-Tava (Ger. Neusiedler See), which has an area of about 100 sq. m., but it is of varying size, and sometimes dries up in part. Eastward it is united with the extensive marsh called the Hanság, through which it is in communication with the river Raab and with the Danube. In the Roman period it was known as Pešo or Pešo. In several places of the dry bed traces of prehistoric lake-dwellings have been discovered. In conjunction with the regulation of the river Raab, and the drainage of the Hanság marsh, plans for the drainage of the lake have been proposed.

Little is known of the early history of Pressburg, which was founded about 1000. It was soon strongly fortified, though it was captured by the king of Bohemia, Ottakar II., in 1271. It received many privileges from the Hungarian kings, especially from the emperor Sigismund, and its strategic situation made it an important fortress. Sigismund held Imperial diets in the town. After the battle of Mohacs in 1526 and the capture of Buda by the Turks, Pressburg became the capital of Hungary. Here in 1606 the Austrian and Hungarian malcontents concluded a treaty with the archduke Matthias, afterwards emperor, against their lawful sovereign, the emperor Rudolf II. In 1619 the town was taken by Bethlen Gabor, but it was recovered by the Imperialists in 1621. In 1687 it was the scene of the session of the estates of Hungary during which the Hungarians renounced their right of choosing their own king and accepted the hereditary succession of the Habsburgs. Here also was held the diet of 1741 when the members swore to assist their sovereign, Maria Theresa, against Frederick the Great. In 1784 Buda took the place of Pressburg as the capital of Hungary, but the latter town continued to be the seat of the parliament until 1848. On the 26th of December 1865 peace was signed here between Napoleon and the emperor Francis I., and in 1869 the town was bombarded by the French.

See J. Kiraly, Geschichte des Donau-Mault- und Urfahr-Rechts der Freistadt Pressburg (Pressburg, 1890); T. Ortway, Geschichte der Stadt Pressburg (Pressburg, 1892), and Pressburgs Strassen und Plätze (Pressburg, 1905).

PRESSÉSÉ, EDMOND DEHAUTÉ DE (1824-1891), French Protestant divine, was born at Paris on the 7th of January 1824. He studied at Lausanne under Alexander Vinet, and at Halle and Berlin under F. A. G. Tholuck and J. A. W. Neander, and in 1847 became pastor in the Evangelical Free Church at the chapel of Taftout in Paris. He was a powerful preacher and a good political speaker; from 1871 he was a member of the National Assembly, and from 1883 a senator. In 1890 he was elected a member of the Academy of Sciences. Pressé laboured for the revival of biblical studies. He contended that the Evangelical Church ought to be independent of the power of the state. He died on the 8th of April 1891.

Bounded in 1854 the Revue chrétienne, and in 1866 the Bulletin théologique, was his work of De l'histoire des trois premiers siècles de l'église chrétienne (6 vols. 1856-1877; new ed. 1887-1889), L'Église et la révolution française (1864; 3rd ed., 1889), Jésus-Christ, son temps, sa vie, son œuvre (against E. Renan, 1866; 7th ed. 1884), Les Origines, le Moyen âge fait de la connaissance; le problème cosmologique (1883; 2nd ed. 1887). See T. Rousseau, Notice sur et les œuvres de Pressé (1894).

PRESS GANG, the popular name for the companies of officers and men who were commissioned to execute the warrants for the impressment of seamen in Great Britain (see IMPRESSMENT). These bodies consisted of a captain, one or more lieutenants, and a band of trustworthy men. They were sent to seaports, or occasionally to inland towns where sailors were likely to be met when going from one coast to another. A "rendezvous" was opened, volunteers were enlisted, deserters arrested, and such "able bodied persons" as were liable to be pressed for service in the fleet were seized, and sent to the guard ships (q.v.).

PRESS LAWS, the laws concerning the licensing of books and the liberty of expression in all products of the printing-press,
especialiy newspapers. The liberty of the press has always been regarded by modern political writers as of supreme importance. "Give me liberty to know, to utter, and to argue freely according to conscience, above all other liberties," says Milton in the Areopagitica.

At the present day the liberty of the press in English-speaking countries is a matter of merely historical importance. But this liberty was a plant of slow growth. Before the invention of printing the Church assumed the right to control the expression of all opinion distasteful to her. When the printing-press was invented German printers established themselves at various important centres of western Europe, where already numbers of copyists were employed in multiplying manuscripts. In 1473 Louis XI. granted letters patent (giving the right of printing and selling books) to "Uldaric Queruing" (Ulrich Gering), who three years earlier had set up a press in the Sorbonne (the theological faculty of the university at Paris), and before long Paris had more than fifty presses at work. The Church and universities soon found the output of books beyond their control. In 1496 Pope Alexander VI. began to revive the old ecclesiastical laws, and in 1517 he issued a bull against unlicensed printing, which introduced the principle of censorship.1 Between 1524 and 1558 the Imperial Diet in Germany drew up various stringent regulations; and in 1535 Francis I., in France, prohibited by edict, under penalty of death, the printing of books. This was too severe, however, and shortly afterwards the Sorbonne was given the right of deciding, a system which lasted to the Revolution.

In England the authority of Parliament was invoked to aid the ecclesiastical authority. There is an ordinance as early as 1382, 5 Ric. II. st. 2, c. 5 (not assented to by the Commons, but appearing upon the parliament roll), directed against unlicensed preachers. After the invention of printing the ecclesiastical censorship was still asserted, but only as collateral with the civil rights of the Crown, claimed by virtue of its general prerogative. After the Reformation the greater part of the rights of censorship passed to the Crown, which at the same time assumed the power of granting by letters patent the right of printing or selling books as a monopoly. The grant, if made to the author himself, was an equivalent of copyright; if made to a person other than the author, it seems to have always been subject to the author's copyright as it existed at common law.

Censorship was either restrictive or corrective, i.e. if it interfered to restrict or prevent publication, or it enforced penalties after publication. Repression of free discussion was regarded as so necessary a part of government that Sir Thomas More in his Utopia makes it punishable with death for a private individual to criticize the conduct of the ruling power. Under Mary printing was confined to members of the Stationers' Company, founded by royal charter in 1536. Under Elizabeth the Star Chamber assumed the right to confine printing to London, Oxford and Cambridge, to limit the number of printers and pressers, to prohibit all publications issued without proper licence, and to punish with unlicensed printing and publications (Order of 1585, Strype's Wyclif, app. 94). The search for unlicensed presses or publications was entrusted to an officer called the "messenger of the press." In 1637 was issued an order of the Star Chamber forbidding the importation of books printed abroad to the scandal of religion or the Church or the government, and the printing of any book not first lawfully licensed. Law books were to be licensed by one of the chief justices or the chief baron, books of history and state affairs by one of the secretaries of state, of heraldry by the earl marshal, of divinity, philosophy, poetry and other subjects by the archbishop of Canterbury or the bishop of London, or the chancellor or vice-chancellors of the universities. There were to be only twenty master printers and twenty four letter-finders. The punishment was at the discretion of the court (Rushworth, Historical Collections, vol. iii. app. 306). The same principle of press restriction was carried out by the Long Parliament after the abolition of the Star Chamber, and it was an ordinance of that body issued in 1643 that called forth Milton's Areopagitica, a Speech for the Liberty of Unlicensed Printing, itself an unlicensed book. The parliament appointed committees for printing, who appointed licensees, but the licensing was really left in a great measure to the wardens of the Stationers' Company. At the Restoration Sir John Birkenhead acted as licensor, appointed apparently under the general prerogative. It was, no doubt, too, under the general prerogative that Charles II., by a proclamation in 1662, called in and suppressed Milton's Defensio pro populo Anglicano. Then followed the Licensing Act of 1662 (31 & 32 Car. II. c. 33), limited to two years. The provisions as to importation of books, the appointment of licensees, and the number of printers and founders were practically re-enactments of the similar provisions in the Star Chamber order of 1637. Printing presses were not to be set up without notice to the Stationers' Company. A king's messenger had power by warrant of the king or a secretary of state to enter and search for unlicensed presses and printing. Severe penalties by fine and imprisonment were denounced against offenders. The act was successively renewed up to 1679. Under the powers of the act Sir Roger L'Estrange was appointed licensor, and the effect of the supervision was that practically the newspaper press was reduced to the London Gazette. The objections made to lines 594-599 of the first book of The Messiah by Edward Low, called the Emperor of the Holy Roman Empire, were not made up to the end of 1705. The Licensing Act of 1712, and for the remainder of the reign of Charles II., as in the reign of George III., the restrictions on the press took the form of prosecutions for libel. In 1685 the Licensing Act was renewed for seven years (1 Jac. II. c. 8, § 15). No mention of the liberty of the press was made in the Bill of Rights. On the expiration of the Licensing Act in 1692 it was continued till the end of the existing session of parliament (4 & 5 Will. and Mary, c. 24, § 14). In 1695 the Commons refused to renew it. The immediate effect of this was to lay authors open to the attacks of literary piracy, and in 1709 the first Copyright Act (8 Anne, c. 9) was enacted for their protection. The power of a secretary of state to issue a warrant, whether general or special, for the purpose of searching for and seizing the author of a libel or the libellous papers themselves—a power exercised by the Star Chamber and confirmed by the Licensing Act—was still asserted, and was not finally declared illegal until the case of Entick v. York Street Magazine Board (2 P. Wms. 256) of 1765. In 1779 the Commons came to a resolution in accordance with this decision. The compulsory stamp duty on newspapers was abandoned in 1833 (18 Vict. c. 27), the duty on paper in 1861 (24 Vict. c. 20), the optional duty on newspapers in 1870 (33 & 34 Vict. c. 38). From that time the English press may be said to date its complete freedom, which rests rather upon a constitutional than a legal foundation. It is not confirmed by any provision of the supreme legislative authority, as is the case in many countries. A declaration in favour of the liberty of the press is usually a prominent feature in the written constitutions of foreign states.

The few existing restrictions on the liberty of the press are presumed to be imposed for the public benefit. They are in some cases of great historical interest. The rights of private persons are in general sufficiently protected in one direction by the law of Libel (q.v.), in another by the law of Copyright (q.v.), while the criminal law provides for the cases of press offences against morality, public justice, &c. Thus the courts have power to punish summarily as a contempt the publication of comments upon proceedings sub judice.

300 PRESS LAWS

1 The principle of the censorship is still uncompromisingly maintained by the Roman Catholic Church; and, this, though in general binding in furo concorsistiae, has necessarily had considerable importance in states which recognize the papacy as an independent power relations with which are established by concordat. Thus in Italy, under the Sardinian constitution of 1848, Bibles, catechisms and liturgical words had to be licensed by the bishop. The principle of the censorship was reasserted at the Congress of Potsdam IX. in 1864, was reaffirmed in the apostolic constitution Officiorum of Leo XIII. and in 1907 in the encyclical Pasendi of Pius X. This last expresses the highest esteem for this institution of censors and orders censors to be appointed in all episcopal curias for the revision of books intended for publication, at the same time directing that their names shall not be made known to the authors of the books condemned. (See also Index Librorum Prohibitorum.)
or reflections upon the conduct of judicial officers. (See Contempt of Court.) The last relic of the censorship before publication is to be found in the licensing of stage plays. By 6 & 7 Vict. c. 68 no new plays or additions to old plays can be acted for hire at any theatre in Great Britain until they have been submitted to the Lord Chamberlain, who may forbid any play or any part of a play. The penalty for acting a play before it has been allowed or after it has been disqualified is a sum not exceeding £50 for every offence and the forfeiture of the licence of the theatre in which the offence occurred. This jurisdiction is exercised by the Lord Chamberlain of England, the Privy Council of Scotland, and the Secretary of State for the Colonies. The court of Queen's Bench has the power to subordinate the Lord Chamberlain's jurisdiction to its own. The right of the printer to print plays in the colony is protected by 8 & 9 Vict. c. 113. The publication of parliamentary debates in any form by any other persons than the printers of the journals of the two houses is still in theory a breach of privilege, but in practice is generally permitted. No restrictions upon the press are to a great extent those imposed for police purposes. By 32 & 33 Vict. c. 24 (confirming in part previous enactments affecting to Great Britain) the printer of any paper or book for/against the use of the means under consideration in an edition of 100 or less, shall be ordered to produce a copy of everything printed, with a few exceptions. Penalties must be sued for within three months, and no proceeding for penalties can be begun until a year has expired. A more severe penalty for the same offence is provided in a previous Act.

The right of an author or publisher to the full profits of his undertaking was at one time restricted by the Copyright Act of Anne (8 Ann, c. 19, § 4), by which the archbishop of Canterbury and other authorities were empowered to lower the price of a book upon complaint that the price was unreasonably high. The present law, which is that of 1886, requires that the name and address of the printer must be printed on all bills, placards, &c., referring to a parliamentary or municipal election. By 6 & 7 Vict. c. 68, § 7, the name and place of abode of a manager of a theatre are to be printed on every playbill and box list. By 30 & 31 Vict. c. 44, the name and address of the printer must be inserted in all advertisements of newspapers, playbills, &c., in the newspapers printed on the premises of the printer. The advertisement in the United Kingdom of foreign or illegal lotteries is prohibited by 6 & 7 Will. IV. c. 66, betting advertisements by 16 & 17 Vict. c. 119, § 7, and 37 Vict. c. 15.

The monopoly of the king's printer does not extend to any translation other than the Authorized Version, and not to that if it be accompanied by new notes or marginal readings.

offences were treated with the utmost severity. By 1585, c. 1, the author of a libellous writing against the king was punishable with death. It is scarcely necessary to say that since the union of the press of Scotland has enjoyed no less liberty than that of England.

The case of letters, books, the Book of Common Prayer, the Confession of Faith, and the Larger and Shorter Catechisms is a licence for printing is still required. The licensing authority is the lord advocate, but all proposed publications are submitted to the body officially known as "His Majesties Lord Advocate and the Moderator and Ministry of the General Assembly of the Church of Scotland, with such other persons as the Moderator may cause to be appointed." The Act of Cessation (1689) established the character of the book-sellers as a voluntary and non-profit-making board. The right of the publisher to publish the doctrine of the Church of Scotland, other books, and documents is exercised by the moderates and other members of the assembly. A licence is also required for printing of any kind, and a general licence granted in 1684. The personal action of the officer of the Crown is not required for the publication of acts or documents, and to be used or to be intended for use for the purpose of or in connection with any secret society existing for criminal purposes.

In the British colonies the press is as free as it is in England. Each colony has its special legislation on the subject for police and revenue purposes. Where there is a government printer, his monopoly is protected by the Colonial Acts of 1870 and 1886. Where there is no government printer, the penalty of five years' imprisonment is fixed for the printing or publishing of any newspaper or other publication that contains any libellous matter or any matter calculated to incite sedition or to excite hatred against any person, nation, or political parties, and is punishable with imprisonment for a term not exceeding six months.

The law is, however, subject to any law made by the colonial legislature.

India.—During the governor-generalship of Lord Lytton was passed the "Act for the better control of publications in Oriental and vernacular languages," 1878. The object of this Act was to prevent the publication of newspapers containing "no words, signs, &c., as in i, or to use or attempt to use it for the purpose of excitation or agitation against the Government of the day," and to prevent the publication of "newspapers or other written matter or writings offering a reward for the return of stolen goods without questions asked subject to a penalty (24 & 25 Vict. c. 96, § 102). This penalty cannot, however, be sued for without the sanction of the attorney-general of the day. These provisions were not observed in practice, and the Act was repealed in 1881.

The advertisement in the United Kingdom of foreign or illegal lotteries is prohibited by 6 & 7 Will. IV. c. 66, betting advertisements by 16 & 17 Vict. c. 119, § 7, and 37 Vict. c. 15.

The right of an author or publisher to the full profits of his undertaking was at one time restricted by the Copyright Act of Anne (8 Ann, c. 19, § 4), by which the archbishop of Canterbury and other authorities were empowered to lower the price of a book upon complaint that the price was unreasonably high. The present law, which is that of 1886, requires that the name and address of the printer must be printed on all bills, placards, &c., referring to a parliamentary or municipal election. By 6 & 7 Vict. c. 68, § 7, the name and place of abode of a manager of a theatre are to be printed on every playbill and box list. By 30 & 31 Vict. c. 44, the name and address of the printer must be inserted in all advertisements of newspapers, playbills, &c., in the newspapers printed on the premises of the printer. The advertisement in the United Kingdom of foreign or illegal lotteries is prohibited by 6 & 7 Will. IV. c. 66, betting advertisements by 16 & 17 Vict. c. 119, § 7, and 37 Vict. c. 15.

PRESS LAWS

tribunals that that law is, in principle, applicable to foreigners. By this law registration of newspapers is obligatory, and the government has power of control, defined in art. 13 as follows: "In the interests of public order or of religion or of morality, every newspaper or periodical can be suspended temporarily or completely by order of the minister of the interior after two warnings, or, without previous warning, by a decision of the council of ministers. Each warning may be accompanied by a fine of from £5 to £20. If a newspaper or periodical which has so continued to appear, the responsible parties can be fined, and the printing-press and the suppressed publication can be closed by order of the minister of the interior. The closure or seizure of the printing-press would, however, in the case of a foreigner require the co-operation of his consul.

This law was from about 1900 allowed to fall into disuse. Owing to the prosperous state of the Arabic newspapers the law was revived in the early part of 1909, and was applied with great moderation. During the year two native papers were warned, and the practice of the law is still more lenient.

The tribunals remained alone competent to inflict any penalty (apart from suspension and seizure of the printing-press) more severe than a fine of £20. If the Penal code of one native paper was sentenced to a year's imprisonment, the editor of another was sentenced to three months' imprisonment. (See Sir Eldon Gorst, Reports on Egypt for 1909 and 1909, specially Egypt No. 1, 1909, pp. 3–5.)

The United States.—The first constitutions of Pennsylvania, Delaware, Maryland and North Carolina, enacted in 1776, are in substance as containing the earliest declarations of any legislative authority, in favour of the liberty of the press. The same principle was afterward embodied in the Constitution of the United States. The acts of Congress dealing with the press. It is certain that the act of Congress has for the most part its own legislation on the subject, and is generally exercised with the same freedom as the law of the United States. The act of 18th August, 1865 forbids diplomatic or consular officers of any country to send to the United States any newspaper or other paper printed in that country, which has at any time been censured by the government of that country. In the case of papers printed in foreign countries the government of the United States is entitled to suspend their publication in the United States, and the act of 1873 permits the government of the United States to suppress any foreign newspaper in regard to the affairs of any foreign state. This act of 1873 is in effect no more than a continuation of the act of 1803, which was renewed in 1812, 1814 and 1824. The law of 1865 prohibits the printing and sale of any newspaper or other paper printed in any foreign country, which has at any time been censured by the government of that country. In the case of papers printed in foreign countries the government of the United States is entitled to suspend their publication in the United States. The act of 1873 is in effect no more than a continuation of the act of 1803, which was renewed in 1812, 1814 and 1824.

Austria-Hungary.—In the Austrian Empire, which from 1800 to 1867 embraced Hungary also, the press laws under Metternich's régime were extremely severe. By the penal code of 1808 all printing had to be licensed, under heavy penalties, and in 1810 two newspapers were appointed to all printing. The press had no shadow of liberty. During the revolution of 1848–49 the principle of the freedom of the press was established, but the censorship was restored in 1852 and not abolished until 1863. The actual press laws of Austria are based on the laws of the 20th of December, 1862 as modified by later supplementary enactments. In principle the press was free of control, but the press was secured by art. 13 of the constitution of the 21st of December, 1867. In practice, however, it was still restricted by the obligation on all booksellers, printers and publishers to deposit "caution money" (Kaufmännische Schriftzüge) with the authorities, and to pay a duty of 2½ per cent on the government stamps on newspapers. The caution money was abolished by the law of the 9th of July, 1894, and the stamp by that of the 27th of December, 1898. The police, however, still have the right, either on their own initiative or at the request of the public prosecutor (Staatsanwalt), to confiscate newspapers which in their opinion offends against the terms of the press laws or is contrary to the public interest. The public prosecutor has, within eight days, to justify this action, either by proceeding against those responsible for the publication, or by requesting the public prosecutor of the printed matter be offensive and ought to be suppressed. This latter "objectionable procedure (objektives Verfahren) is peculiar to Austria as the most rigorous of control in the hands of the authorities. In 1902 the government, in contradistinction to the other provisions of the press law, was liberal in the sense that the bill was postponed to more urgent matters. The press law was, in fact, again revised in 1893, and the constitution of 1848, which was re-established in 1862, and the censorship was abolished; but, in addition to provision for the cases of libel, incitement to violence and crime, etc., the law also provided for certain political press offences (§ 6–8), i.e., attacks on the king or members of the cabinet, or the dissolution of the territorial unit of the state or of the dynastic link with Austria; (d) the forcible alteration of the constitution; (e) indecent or scandalous publications; (f) commission of crime. Press offences are tried before the Court of Criminal Law. Code of 1879 (§§ 170–174) further offences were made punishable, including "direct incitement of one class of the population to hatred against another," instead of a general prohibition, and glorification of any one who has suffered punishment for such offences. Direct incitement (§ 172), was subsequently interpreted by the curia to mean "any spoken or written word... which is capable of producing in another hatred against a nationality, etc."

The result of these provisions has been that liberty of the press has existed in practice only for the Magyars, constant prosecutions having been directed against the editors and proprietors of publications. The protection of the press to the grievances of the other Hungarian races, conviction being allowed of the necessity of certain publications to the special juries (due to the high property qualification) being almost exclusively composed of members of the dominant race.

Transylvania, where the old stringent Austrian press law of 1852 is still in force. The censor has discretionary powers to confiscate obnoxious literature. The law against the Rumanian press. (See R. W. Seton Watson, Racial Problems in Hungary, London, 1908, pp. 293 sqq.)

Belgium.—The printing of political writings by the Dutch government that direct. The law of 1831, art. 18, it is declared that the press is free, that censorship shall never again be established, that sureties cannot be exacted from writers, editors or printers, and that when the author is known and domiciled in Belgium the printer or bookseller cannot be prosecuted. By law 98 press offences are to be tried by jury. The legal penalty of the fines contained in the decree of the 20th of July, 1831, was made perpetual. By this law it is made an offence, apart from the penal code, (1) to incite to the commission of a crime by public proceedings or printed writings in a public meeting; (2) to attack the obligatory laws, or to incite to disobedience of them; (3) to attack the constitutional system of the state; (4) to determine the inviolability of the king, the constitutional authority of the dynasty, or the inviolability of the chambers. Every copy of a journal must bear the name of the printer and the indication of his domicile in Belgium. Procedural law. The name of the offender must be mentioned, and the press law must be taken in some cases within three months, in others within six months.

Denmark.—Press offences were at one time punished with great severity. By the code of Christian V. (1683) libel was punished with 200 livres, and hard labour for life, and, if against a magistrate, with death. Censorship was abolished by the law of 1886. Art. 86 of the constitution granted by Frederick VII. on the 5th of June 1849 and confirmed by Christian IX. in 1866. Art. 81 of the constitution for the search for or seizure of printed matter in a dwelling-house, unless after warning the search is made.

France.—The government began early to impose stringent restrictions upon printing. An edict of Henry II. in 1559 made it punishable with death to print without authority. The university of Paris originally claimed the right of licensing new theological works, a jurisdiction vested in the, or his chancellor (1538). Laws of 1566. Officials against religion were severely punished by the secular authorities. Thus the parliament of Toulouse sent Venini to the stake in 1619 for the crime of publishing a heretical work. A few years later, a cardinal Richelieu declared it a capital offence to publish a work of the most infamously despised heresy. In 1723 appeared a regulation forbidding any but licensed booksellers to deal in books. Many later regulations were directed against unlicensed papers, the employment of more than a certain number of workmen, and prosecutions of these restrictions were abolished, and the Assembly declared it to be the right of every citizen to print and publish his opinions. The law of 1763 clearly defined a check, which was attempted as early as 1791, but no effectual law was to be established until the law of the 5th of February 1810 established a direction of the press. The charter of Louis XVIII. in 1814 gave liberty to the press in every case, but restrictions soon followed. In 1819 a system of "cautionments" was replaced by the "souvenir." The Revolution of 1830 was caused by, inter alia, one of the ordinances of St. Cloud (July 25, 1830) for suspension of the liberty of the press. Nevertheless, the press was not entirely free of restrictions. The press law of 1852 only to be suspended by the law of 1862. Only the law of 1862. During the Second Empire government the press was free. The law of 1868 was used as a powerful engine against the press. The proceedings of the press were not lessened in 1888 are a well-known instance. Between 1858 and 1866 the press was suppressed by proclamation. With the republic the liberty of the press was restored. A decree of the 27th of October 1870 abolished press offences to trial by the law of the 29th of July 1881, by which the French press is now regulated, providing the liberty of the press and of bookselling. The principal limitation of the law is the prohibition to publish criminal proceedings before hearing, or lists or subscriptions for indemnifying an accused person, and the power of forbidding the entrance of foreign newspapers under certain circumstances. The objectionable proceedings of a printed matter is (1) the manager or editor, (2) the author, (3) the printer, (4) the vendor or distributor. The printer and the vendor, however, must show the person falling within their proper functions. Proceedings for breaches of the law must be taken within three months. As to taxation, the decree of the 5th of September 1870 abolished the stamp duty upon newspapers, but it is still imposed.

1 See Dalloz, Jurisprudence générale, s.n. "Presse"; ibid. Tables alphabétiques (1845–1877), s.n. "Presse."
PRESS LAWS

upon public notices (affiches) other than those of public authorities. None but the notices of public authorities may be printed on white paper.

Germany.—Censorship was introduced by the diet of Spires in 1848. From that time till 1848 there were no restrictions on the liberty of the press. One of the most important resolutions of the diet was to suppress the press in the states subject to the empire, and to confer upon the court a more extensive power of censorship. Soon after that year, however, it became necessary to establish press laws in most of the German states, as in Bavaria in 1848. Prussia and Baden, 1849. Since the establishment of the new empire censorship has disappeared, but the press is subject to the military and judicial jurisdiction of the state it is in. every one attacking the empire or its officers through the press is liable to punishment in his own state. By art. 4 the laws relating to the press are under imperial and not local control. The press law of the 18th of March 1848 was the last considered under the empire. At its beginning it affirms the liberty of the press. Its main provisions are these: The name and address of the printer must appear on all printed matter. Newspapers and periodicals must in addition bear the name of some one person, domiciled in the empire, as responsible editor, and a copy of every book to be published with the police authorities in the district in which it is published. Foreign periodicals may be excluded by proclamation of the Diet for two years, if twice within the year they have been guilty of certain offences against the penal code. Criminal proceedings are not to be reported while still sub judice. The order of responsibility for offences is the same as in France. Proceedings must be taken within six months. In certain cases printed matter may be found not guilty of an offence unless a decision of the court may take place where (1) the publication does not bear the name of the printer or editor, (2) military secrets are revealed in time of war, (3) the paper is designed to undermine or subvert the government. The proposal of the Reichstag that all press offences should be tried by the courts was rejected by the government, except as regards those states (Bavaria, Wurttemberg, Baden, Oldenburgh) where this principle was introduced.

Greece.—Under King Otto censorship was exercised up to 1844. By the constitution of the 18th of March 1848 every one may publish his thoughts by means of the press, observing the laws of the free press and censorship (kynoseuma) is not permitted. Responsible editors, publishers, printers and persons printing books are not required to deposit money on the ground of surety. Publishers of newspapers must be Greek citizens (art. 10). The legislature may exclude reporters from its sittings in certain cases (art. 48). Press offices are to be tried by jury, except when they deal only with private life (art. 93).

Holland.—The press has been free since the existence of the present kingdom of the Netherlands, which dates from 1815. [120] By art. 8 of the constitution of 1848. By art. 286 of the penal code seditional books or newspapers may be seized. By art. 283 of the same code and by a royal decree of the 25th of January 1814 the name of the printer must appear upon newspapers. Press offences are not tried by jury.

Italy.—By art. 27 of the political code of Sardinia, granted by Charles Albert on the 4th of March 1848, and still in force, the press is free, but abuses of the liberty are restrained by law. The present press law of Italy is considerably modified by later enactments. Everything printed in typographical characters, or by lithography or any similar means, must have the name and address of the printer and the place and date of printing and the name and address of the printer. A copy of any book or publication must be preserved by the printer or editor, and at certain official and certain libraries. Before the publication of any newspaper or periodical, notice of the intended publication must be given at the office of the secretary of state for internal affairs with the emblem of the state, and the signature of the legal qualifications of the person intending to publish, whether printer or editor, (2) the nature of the publication, and (3) the name and residence of the responsible editor. Every newspaper is bound to insert a declaration of any change made against a person in its columns. For educational purposes and other regulations there is a statutory penalty not exceeding 1000 lire (400). [121] The publication of a newspaper may be suspended until notice is given of the reasons for suspension. The publication of parliamentary debates is permitted. Press offences are not tried by jury. By a law of the 11th of May 1877 it is forbidden to publish any indication of the way in which individual judges or jurors voted in their decisions.

Norway.—The liberty of the press is secured by art. 100 of the constitution of 1814. No one can be punished for any writing unless he, or some one by his instigation, offended against the state, religion, or decency, or made infamous accusations against any one. Criticism of the government is expressly permitted.

Ottoman Empire.—By art. 12 of the constitution of the 23rd of December 1876 the press was recognized as free, subject to the limits imposed by law. The constitution was, however, suspended, and a rigorous censorship was enforced, under the direction of Sultan Abdul-Hamid II., until the revolution of 1908.

Russia.—It is stated that a press existed up to the establishment of the Inquisition, and that Gil Vicente (d. 1530) was the last writer who dared to express his thoughts freely. At a later period Bocage was imprisoned for his writings. But after the revolution of 1861, and the publication under the name of the "Real Face," the "Messa di desembarco do paço," assumed to edition of libel. Liberty of the press was, however, finally secured, and censorship limited. By the constitution granted by John VI. in 1821. By art. 8 a special tribunal was set up for the trial of journalists, and legal and illegal publications from Brazil to protect the liberty of the press. The constitution was confined to that exercised by the bishops over theological or dogmatic works. The debates in the legislature and proceedings in the courts of justice are not generally reported.

Rumania.—By the constitution of the 30th of June 1866, art. 5, Rumanians enjoy liberty of the press. By art. 24 the constitution guarantees to all the liberty of communicating and publishing ideas through the press, every one being liable for abuse in cases determined by the penal code. Press offences are to be tried by the courts. Censorship is abolished, and is never to be re-established. No previous authorization is necessary for the publication of newspapers. The censorship is confined to demanded by journalists, writers, editors or printers. The press is not liable to the payment of advertisements. No newspaper or publication is to be suspended or suppressed. Every author is responsible for his writings; in default of the author, the manager or editor is responsible. Every newspaper must have a responsible manager in the possession of civil and political rights.

The position of the Russian press generally was, previously to the revolution of 1870, regulated by a law of the 6th of April 1865. The law was modified in 1873, and again in 1875. All newspapers published in St Petersburg or Moscow all newspapers, periodicals and original works and translations not exceeding a certain number of pages, and (wherever published) all government publications, were liable to be censored by the minister of interior. Scientific works, educational works, and maps, plans, and charts. Everything printed in Russia that did not fall within any of these categories had, before issue for the public, to be submitted for the approval of the government. The censorship was abolished in 1905. The minister of the interior had power to dispense with the permission in the case of provincial newspapers and periodicals. In St Petersburg and Moscow the periodical press was subject to corrective measures, and the infringement of the numerous regulations contained in the constitution was tried at times by secret instructions from the minister of the interior to editors and publishers. Apart from the code, the sustained display of a spirit hostile to the government rendered the publisher of a periodical liable to punishment. The minister of the interior might at any time issue an order against the press regulations consisted in the infliction of a series of warnings published in the "Official Gazette." A warning merely enjoined more care for the future; a second was followed by suspension of the periodical; a third by suppression. The right to insert advertisements; a third by suppression, and perhaps prosecution of the offending conductor. By Imperial ukaz of the 2nd of June 1872 the jurisdiction of the judicial tribunals over press offences was practically transferred to the minister of the interior, except in the case of violation of private rights, as by libel. The laws were modified in 1874 by a regulation to the effect that all publications appearing at longer intervals than one week should be submitted to the minister of the interior. This applied to all periodicals that had been formerly published without censorship. By a ukaz issued in 1881 a committee of four members was entrusted with the decision of all matters relating to the press submitted to it by the minister of the interior. The strictest supervision was exercised over the press, which was compelled to publish a few columns for privileged individuals, such as members of the royal family, foreign pensioners, ambassadors, and editors of newspapers in the capital, might receive foreign publications free of censorship. The censorship consisted in the instruction of the publisher to excise certain paragraphs, columns, and sheets of publications that might be deemed pernicious. Only such periodicals as were placed on a list approved by the board of censors were allowed to be received through the post office by non-privileged persons. Only correspondence, messages, and newspapers were subject to strict censorship. The Russian telegraphic press agency is under official management.

Full liberty of the press was guaranteed by the Imperial ukaz of the 6th of October 1867, and though no special legislation followed the ukaz, the censorship was for a time reduced to a minimum. The reaction, however, the old conditions were to a certain extent re-established. In St Petersburg, for instance, the newspapers were once again under the absolute jurisdiction of chief of police and were forbidden to publish any reference to members of the imperial family or to the affairs of Poland (except official notices). In 1908 as many as 73 newspapers and periodicals were suppressed, of which 28 were in St Petersburg alone.
Spain.—There was probably no country where restrictions on the liberty of the press were at one time more stringent than in Spain. From the first use of printing up to 1521 censorship was exercised by the Crown; after that date the Inquisition began to assume the right, and continued to do so up to its suppression in 1808. In 1588 Philip II denounced the penalty of death against even the possessor of a book upon the Index expurgatorius of the Inquisition. Some of the greatest names in Spanish literature were sufferers: Castilejo, Don Antonio de la Cruz and others. The famous translation of the Song of Solomon: Luis Ponce de Leon was imprisoned for his

PRESTEIGN—PRESTER JOHN

Spurn.—In 1821 the writing law of the 16th of July 1821 is one of the fundamental laws of Sweden. It is an expansion of art. 86 of the constitution of the 6th of June 1809. The provision in 1809, in the press, is declared to be the privilege of every Swede, subject to prosecution for libellous writing. Privileges of individuals as to publication are abolished. The title and place of publication of every newspaper or periodical must be registered, and every publication must bear the name of the printer and the place of printing. Print offences are tried by a jury of nine, chosen respectively by the prosecutor, the prisoner, and the court. The verdict of two-thirds of the jury is final.

Sweden.—The press law of the 30th of June 1876, promulgated at the accession of Alfonso XII., practically re-enacts this provision.

PRESTEIGN, a market town, urban district, and assize and county town of Radnorshire, Wales, situated on the Lug amidst beautiful scenery. Pop. (1901), 1245. Presteign is the terminus of a branch of the Great Western railway running north from Titfield Junction in Herefordshire. The old-fashioned town contains the parish church of St. Andrew, that was, from the 15th century, and an interesting old inn, the "Rudshire Arms," once the residence of the Bradshaw family in the 17th century. To the west rises the Warden, a wooded hill laid out as a public park. Presteign is the most easterly spot on the Welsh border, a circumstance that is noted in the Cymric expression to mark the extreme breadth of the Principality—o Tydweil i Llandradas ("from St Davids to Presteign"). Although the Welsh name of Llandradas is said to denote a foundation by St Andras ap Rhun ap Brychan in the 5th century, the place seems to have been an obscure hamlet in the lordship of Moelynaidd until the 14th century, when Bishop David Martyn of St Davids (1290-1328) conferred valuable market privileges upon this his native place, which on doubtful authority is said to derive its English name from this priest. In 1342 Presteign was named as the meeting place of the county sessions for Radnorshire in conjunction with New Radnor, and it has ever since ranked as the county town. Although an ancient borough by prescription, Presteign was not included in Radnor parliamentary district until the 17th century, and of this privilege it was deprived by the Redistribution Act of 1885.

PRESTER JOHN, a fabulous medieval Christian monarch of Asia. The history of Prester John no doubt originally gathered round some nucleus of fact, though what that was is extremely difficult to determine. But the name and the figure which it suggested occupied so prominent a place in the mind of Europe for two or three centuries that a real history could hardly have a stronger claim to exposition. Before Prester John appears upon the scene we find the way prepared for his appearance by a kindred fable, which entwined itself with the legends about him. This is the story of the appearance at Rome (1122), in the calixtus II., of a certain Oriental ecclesiastic, whom one account styles "John, the patriarch of the Indians," and another "an archbishop of India." This ecclesiastic related wonderful stories of the shrine of St Thomas in India, and of the miracles wrought there by the body of the apostle, including the distribution of the sacramental wafer by his hand. We cannot regard the appearance at Rome of the personage who related these marvels in presence of the pope as a mere popular fiction: it rests on two authorities apparently independent (one of them a letter from Odo of Reims, abbot of St Remy from 1118 to 1121), for their discrepancies show that one was not copied from the other, though in the principal facts they agree. Nearly a century after a later Prester John appears upon the scene, in the character of a Christian conqueror and potentate who combined the characters of priest and king, and ruled over vast dominions in the Far East. This idea was universal in Europe from about the middle of the 12th century to the end of the 13th or beginning of the 14th. The Asiatic story then died away, but the name remained, and the royal presbyter was now assigned a locus in Ethiopia. Indeed, it is not improbable that from a very early date the title was assigned to the Abyssinian king, though for a time this identification was overshadowed by the prevalence of the Asiatic legend. At the bottom of the double allocation there was, no doubt, that confusion of Ethiopia with India which is as old as Virgil and perhaps even earlier. The first mention of Prester John occurs in the chronicle of Otto, bishop of Freisingen. This writer states that when at the papal court in 1145 he met with the bishop of Gabala (Jibal in Syria), who related how "not many years before one John, king and priest (rex et sacerdos), who dwelt in the extreme Orient beyond Persia and Armenia, and was, with his people, a Christian but a Nestorian, had made war against the brother kings of the Persians and Medes, who were called Samiards (or Sanjards), and captured Ecbatana their capital. After this victory Prester John—for so he was wont to be styled—advanced to fight for the Church at Jerusalem; but when he arrived at the Tigris and found no means of transport for his army, he turned northward, as he had heard that the river in that quarter was frozen over in winter-time. After halting on its banks for some years in expectation of a frost he was obliged to return home. This personage was said to be of the ancient race of the Magi mentioned in the Gospel, to rule the same nations that they ruled, and to have such wealth that he used a sceptre of solid emerald. Whatever impression was made by this report, or by the New Jerusalem event on which it was founded, was far exceeded, about 1165, by the circulation of a letter purporting to be addressed by Prester John to the emperor Manuel. This letter, professing to come from "Prester John, by the power and virtue of God and of the Lord Jesus Christ, Lord of Lords," claimed that he was the greatest monarch under heaven, as well as a devout Christian. The letter dealt at length with the wonders of his empire. It was his desire to visit the Holy Sepulchre with a great host, and to subdue the enemies of the Cross. Seventy-two kings, reigning over as many kingdoms, were his tributaries. His empire extended over the three Indies, including that of Farther India, where lay the body of St Thomas, to the sun-rising, and back again down the slope to the ruins of Babylon and the tower of Babel. All the wild beasts and monstrous creatures commemo-rated in current legend were to be found in his dominions, as well as all the wild and eccentric races of men of whom strange stories were reported, including those unclean nations whom Alexander Magus was said to have subdued among the mountains of the north, and who were to come forth at the latter day—and so were the Amazons and the Bragmans. His dominions contained the monstrous ants that dug gold and the fish that gave the purple; they produced all manner of precious stones and all the famous aromatics. Within them was found the Fountain of Youth; the pebbles which give light, restore sight, and render the possessor invisible; the sea of Sand was there, stored with fish of wondrous savour; and the River of Stones was there also; besides a subterranean stream whose sands were of gems. His territory produced the worm called "salamander," which lived in fire, and which wrought itself an incombusable envelope from which were manufactured robes for the presbyter, which were washed in flaming fire. When the king went forth to war thirteen
great crosses made of gold and jewels were carried in wagons before him as his standards, and each was followed by 10,000 knights and 100,000 footmen. There were no poor in his dominions, no thief or robber, no flatterer or miser, no dissensions, no lies, and no vices. His palace was built after the plan of that which St Thomas erected for the Indian king Gondopharos. Of the splendour of this details are given. Before it was a marvellous mirror erected on a many-stored pedestal (described in detail); in this speculum he could discern everything that went on throughout his dominions, and detect conspiracies. He was waited on by 7 kings at a time, by 60 dukes and 365 counts; 12 archbishops sat on his right hand, and 20 bishops on his left, besides the patriarch of St Thomas’s, the protopope of the Sarmaagarians (Samarakand?), and the archprotopope of Susa, where the royal residence was. There was another palace of still more wonderful character built for him outside the city, the edifice for a heavenly command, in the city of Bribirc. Should it be asked why, with all this power and splendour, he called himself merely “presbyter,” this is because of his humility, and because it was not fitting for one whose sewer was a prince and king, whose butler an archbishop and king, whose chamberlain a bishop and king, whose master of the horse an archmandrite and king, whose chief cook an abbot and king, to be called by such titles as these.

How great was the popularity and diffusion of this letter may be judged in some degree from the fact that Zarnecke in his treatise on Prester John gives a list of close on 100 MSS. of it. Of these there are 8 in the British Museum, 10 at Vienna, 13 in the great Paris library, 15 at Munich. There are also several renderings in old German verse of the contents of the time tended to render such a letter acceptable. Christendom would welcome gladly the admission of a counterpoise arising so unexpectedly to the Mahomedan power; while the statements of the letter itself combined a reference to and corroboration of all the romantic figments concerning Asia which already fed the curiosity of Europe, which figured in the world-maps, and filled that fabulous history of Alexander which for nearly a thousand years supplanted the real history of the Macedonian throughout Europe and western Asia. The only other surviving document of the 12th century bearing on the subject is a letter of which only the opening lines are known: Cambridge and Paris libraries, and which is also embedded in the chronicles of several English annalists, including Benedict of Peterborough, Roger Hoveden and Matthew Paris. It purports to have been written by the Bishop of the Rialto at Venice by Pope Alexander III. on the 5th day before the calends of October (Sept. 27), data which fix the year as 1177. The pope addresses it, carissimo in Christo filio Johanni, ilustri et magnifico dominario regi [Hoveden’s copy here has “domino regi”]. He refers to him as the monarch’s Christian profession, diligence in good works and piety, by manifold narrators and common report, but also more particularly from his (the pope’s) physician and confidant (medicus et familiaris noster), Master Philip, who had received information, of which he had in trust, the persons of the monarch’s kingdom, with whom he had intercourse in those (Eastern) parts. Philip had also reported the king’s anxiety for instruction in Catholic discipline and for reconciliation with the apostolic see. Philip had also collected all the documents of the association of Prester John with the Turks; and in later days the use of this term “kafir” led to misapprehensions, as when Vasco da Gama’s people were led to take for Christians the Banyan traders on the African coast, and to consider them infidels, as the Christians were told in the East, of whom they heard at Calicut. How the name John arose is one of the obscure points. Oppert supposes the title “Gur Khan” to have been confirmed with Yukkanan or John; and it is not improbable that the name Khorasan is a corruption of “the Khorasans,” repeated in the early part of this article, may have already mingled with the rumours from the East.

The failure in the history of the Gur Khan to meet all points in the evidence of the bishop of Gabala led Professor Brun of Odessa to bring forward another candidate for identity with the original Prester John, in the person of the Georgian prince John Orbelian, the “abasalar,” or generalissimo under several kings of Georgia in the 11th and 12th centuries. He calls him, indeed, the first officer of the association of Prester John with the Caucasus. In one at least of these the title is applied to the king of Abassia, i.e. of the Abasalians of Caucasus. Some confusion between Abash (Abasinsia) and Abyssinia seems to have arisen at the time of the Moghul. An abstract of Professor Brun’s argument will be found in the 2nd edition of Sir H. Yule’s Marco Polo, ii. 359–542. As regards any real foundation for the title of “Presbyter” we may observe that nothing worth mentioning has been alleged on behalf of any candidate.

When the Mongol conquests threw Asia open to Frank travellers in the middle of the 13th century their minds were full of Prester John, and his adventures and ascriptions were few. It was in the nature of things that they should not find some representative. In fact they found several. Apparently no real tradition existed among the Eastern Christians of such a personage; the only real connection now can be traced to the wandering of the Mongol state from the northwestward from Asia. But the persistent demand produced a supply; and the honour of identification with Prester John, after hovering over one head and another, settled for a long time upon that of the king of the Nestorian tribe of Kerait, famous in the histories of Fuzheng under the name of Ung or Awang Khan. In Carpin’s (1248) single mention of Prester John as the king,
of the Christians of India the Greater, who defeats the Tatars by an elaborate stratagem, Oppert recognizes Jalaluddin of Kharezim and his brief success over the Mongols in Afghanistan. In the Armenian account Sempad's account (1248), on the other hand, this Christian king is identified with the Nestorian King of Kakai, who repels the Saracens, and becomes the vassal of the Mongols. In the narrative of William Rubruckis (1253), though different reference is made to the conquering Gur Khan under the name of Coir Cham of Caramay, did not know that the Crusaders of Outremer had a joint claim to the throne of the Saracens, and had made in the great tales that went forth about King John, it is evident that the intelligent traveller supposed this king of the Saracens to be the original of the widely spread legend. He mentions, however, a king called Narn, regis of Kakai, or Karakaya, and, as he believed him to be the ally of Jenghiz, but a breach occurred between them, and they were mortal enemies till the death of Ung Khan in 1293. In the narrative of Marco Polo, we learn of a 'Great Prince,' who, as we shall see later, was representative of the great of the Saracens, and he who married the daughter of the last representative of the ruler of the gur khans. And from the remarks which Rubruckis makes in connexion with this King John, on the habit of the Saracens in taking the names of his predecessors, and the position of the potentate whom he addressed from Venice in 1277, the only real person to whom the letter can have been sent was the king of Abyssinia. Let it be observed that the "honourable person," with whom he was familiar, and to whom he had written in the East must have been the representatives of some real power, and not of a phantom. It must have been a raw king who professed to desire reconciliation with the Catholic Church and the Crusades. But, still, it is not improbable that this was the case at Jerusalem. Moreover, we know that the Ethiopian Church did long possess a chapel and altar in the Church of the Holy Sepulchre, and, though we have been unable to find travellers' testimony to this older than about 1400, it is quite possible that the appropriation may have come about in the 13th century. We know from Marco Polo that about a century after the date of Pope Alexander's epistle a mission was sent by the king of Abyssinia to Jerusalem to make offerings on his part at the Church of the Sepulchre. It must be remembered that this was before the pope's letter Jerusalem, which had been taken from the Moslem in 1099, was still in Christian possession. Abyssinia had been going through a long period of vicissitude and distraction. In the 10th century the royal line had been superseded by a chain of local potentates; in the 12th century, by a dynasty of Arab princes; in the 13th century by the Kananid Dynasty; but weakness and disorder continued till the restoration of the "House of Solomon" (c. 1268). Nothing is more likely than that the princes of the "Christian families" who had possessed the title of king in Ethiopia in the 12th century might have been acquainted with the "Knights Templar," who called themselves by a connexion with European Christendom, and to establish relations with Jerusalem, then in Christian hands. We do not know whether the leech Philip ever reached his destination, or whether it ever reached him. 

Baronius, who takes the view for which we have been arguing, supposes it possible that the church in Rome possessed in his own time by the Abyssinians (St Stephen's in the Vatican) might have been the result of a mission of which this was the outgrowth. Baronius points to the modern idea that a modern concession during the attempts to master the Ethiopian Church early in the 16th century. Ludolf intimates that its occupancy had been taken from them in his own time after it had been held by the Abyssinians for several centuries.

In the legendary history of the Translation of the Three Blessed Kings by John of Hildesheim (c. 1379), where an account and extracts are given by Zurncke (Abhandl. ii. 154 seq.), we have an account of this legend. Here we have the story that in the year 1594, which we may regard as a modern conjecture, we have the legend of the translation of the three Kings to Rome by Pope Sixtus. This is the first experiment of the Ethiopian Church, this was a translation of the three Kings to Rome, and a modern concession during the attempt to master the Ethiopian Church early in the 16th century. Ludolf intimates that its occupancy had been taken from their own time after it had been held by the Abyssinians for several centuries.

From the 14th century onwards Prester John had found his seat in Abyssinia. It is there that Fra Mauro's great map (1459) presents a fine city with the rubric, "Qui il Preste Janni fa residenz principale del Regno di Abyssinia," a city, to the north of the country, some 40 miles distant from the capital, and nearer the end of the century (1451-1459), King pitch, and brand themselves with the sign of the cross in token of their baptism" (Libro del conocimiento de todos regnos, &c., printed at Madrid, 1877). Indeed, we can carry the date back half a century further by the eviitatio per Indiam Majorum, et per regnum saceredit Johannis, et per regna magis proxima Orienti dilutatam". We have little doubt that Abyssinia was the "regnum" here indicated, though it was a mistake to identify the Abyssinian Church with the Nestorians.

1 It has been pointed out by Alexander Wylie that Khusuk was son of a powerful king of the Moors, whose name Tu-Yang-Khan is descended from "Great King John" as nearly as that could be expressed in Chinese.

2 The stories of Khita as a Christian empire, which led the Jesuits at the court of Akbar to despise Benedict Goes in search of it (1660), is taken from the Teutonic chivalric literature. The country in question was the Kathar of Marco Polo, and its Christian king the representative of the famous Prester John—a jumble of inaccuracy.

3 In the Spanish work of the same date, by an anonymous Franciscan, we are told that the emperor called "Abdesellib, which means 'sirvent of the Cross,' is a potest of Preste Juan, who is the patriarch of Nubia and Ethiopia, and is lord of many great lands, and many cities of Christians, though they be black as..."
PRESTDIGITATION—PRESTON

John II. of Portugal was prosecuting inquiries regarding access to India his first object to open communication with "Prestor John of the Indies," who was understood to be a Christian potentate in Africa. And when Vasco da Gama went on his voyage from Mozambique northwards he began to hear of "Presto Joham" as reigning in the interior—perhaps, by the light of preconceptions of the existence of that personage in East Africa he thus interpreted what was told him. More twenty years later, when the first book on Abyssinia was composed—that of Alvaro de' Azevedo, naming the king of Abyssinia is "Prestor John," or simply "the Preste,"

On the whole subject in its older aspects, see Ludolf's Historia Aethiopica and its Commentary, passim. The excellent remarks of M. M. H. in the Traité des colonies, and most of the rest of the subject, are in the Recueil de voyages et de mémoires published by the Société de Géographie, iv. 547-564 (Paris, 1839). Two German works of importance which have been used in this article are the Geschichte der Annalen der Landmannschaften in Africa; and method of discussion and all the passages bearing on the subject, Der Prestor Johannes, by Friedrich Zarncke of Leipzig (1876-1879). See also Sir H. Yule's Cervantes and Pliny Thiriet, p. 172. Read in Marco Polo (2nd ed.), i. 229-233, ii. 539-543.

PRESTDIGITATION (from Lat. praesto, ready, and digitus, finger), the art of conjuring by nimble-fingered dexterity, particularly as opposed to the use of mechanical devices (see Conjuring). The Latin praestigiis, illusion, praestigiae tricks, and praestigiatore, juggler (from praes, before, and stinger, to prick), cover the same meaning though differently derived.

PRESTIGE, influence and authority exercised by reason of high reputation. It is one of the few words which have gained a meaning superior to that of original usage. The word in French, from which it has been borrowed by English, as in Latin praestigium or praestigiae, meant jugglers' tricks, deceit, imposture, and so is found in the 16th century. The Latin "tands for praestigium, from praestrigere, to bind or fasten tight, hence to blindfold; others derive from praestinguere, to darken, obscure, deceive. The word was at first generally used as foreign and italicized; thus the New English Dictionary quotes Sir Walter Scott (Paul's Letters to his Kinsfolk, 1813) for the earliest example in English of the modern usage, "No sooner had the dazzling blare of decisive victory... nor renew the charm or prestige... once attached to his name and fortunes." Other words derived from praestigium through the French retain the original meaning of juggling or conjuring (see Prestdigitation).

PRESTON, JOHN (1587-1628), English Puritan divine, was born at Heyford in Northamptonshire and was educated at Queens' College, Cambridge (fellow 1609). He took orders, and on becoming dean of his college drew large crowds to hear his preaching. On the duke of Buckingham's advice he was appointed chaplain to Prince Charles in 1620; in 1622 he became preacher at Lincoln's Inn and master of Emmanuel College, Cambridge. After the accession of Charles I. he worked hard on behalf of the Puritan cause, but could accomplish little or nothing against Archbishop Laud. In theology he was a stanch Calvinist and his writings had considerable popularity.

PRESTON, a municipal, county, and parliamentary borough and port, of Lancashire, England, on the river Ribble, 209 m. N.W. by N. from London by the London & North-Western railway; also by the Lancashire & Yorkshire railway. Pop. (1891), 102,173; (1901), 105,758. At the beginning of the 19th century it was about 17,000. The nucleus of its site consists of a rise rising sharply from the north bank of the river, while the surrounding country, especially to the west about the estuary, is flat. Among the numerous parish churches of that St John, built in Decorated style in 1835, occupies a site which has carried a church from early times. Among several Roman Catholic churches, that of St Walburgis (1854) is a handsome building of Early Decorated character. Of public buildings the most noteworthy is the large town hall, with lofty tower and spire, in Early English style, built in 1867 from designs by Sir Gilbert Scott.

The free public library and museum were established in 1879 by the trustees of E. R. Harris, a prominent citizen. A new building was opened in 1893. Here is placed Dr Shepherd's library, founded in 1761, of nearly 9000 volumes, as well as a collection of pictures, &c., valued at £20,000, bequeathed by the late R. Newsham. The Harris Institute, endowed by the above-named trustees with £20,000, is enriched with a library of classical style erected in 1854, wherein are held science and art classes, and a chemical laboratory is maintained. For the grammar school, founded in 1550, a building in the Tudor style was erected in 1841 by private shareholders, but in 1868, they sold back the school and erected the new building of the school. The blue-coat school, founded in 1701, was in 1817 amalgamated with the national schools. A Victoria Jubilee technical school was established under a grant from the Harris trustees in 1897. There is also a deaf and dumb school.

The extensive industrial works in the town provided with the railway connections, including the Appleby, the Miller Park, with a station of the 14th Earl of Derby (d. 1869), the Moor Park, the Marsh, and the Deepdale grounds, with an observatory. Preston is one of the principal scots of cotton manufacturing in Lancashire. There are also iron and brass foundries, engineering works, cotton machinery works, and boiler works, and some shipbuilding is carried on. In 1864 Preston became a creek of Lancaster, in 1839 it was included in the new county, and in 1844, and was carried out at a cost of over one million sterling. The main wet dock, opened in 1829, is 3420 ft. long and 600 ft. wide. The total quayage is over 8500 lineal feet. The channel of the river has been made straighter, and from docks and quays were removed, so that the docks are accessible for vessels of 17 ft. draught on ordinary spring tides. A canal connects Preston with Lancaster.

The parliamentary borough, which returns two members, falls between the Blackpool and Darwen divisions of the county. The corporation consists of a mayor, five burgesses and 36 councillors. Area of municipal borough, 3971 acres.

Preston, otherwise Prestune, was near the minor Roman station at Walton-le-Dale and the great Roman road running from Warrington passed through it. It is mentioned in Domesday Book as one of Earl Tostig's possessions which had fallen to Roger of Poictou, and on his defection it was forfeited to the Crown. Henry II. about the year 1179 granted the burgesses a charter by which he confirmed to them the privileges he had granted to Newcastle-under-Lyme, the chief of which were a free borough and a gild merchant. This is the first of fourteen royal charters which have been granted to Preston, of which are as follows: John in 1219 confirmed to Preston all the rights granted by Henry II.'s charter and also "their fair of eight days" from the Assumption (Aug. 15) and a three days' fair from the eve of Saints Simon and Jude (Oct. 28). Henry III. in 1217 confirmed the summer fair, but for five days only, and granted a weekly market on Wednesday. Edward III. (1328), Richard II. (1379), Henry IV. (1401), Henry V. (1414), Henry VI. (1425) and Philip and Mary (1557) confirmed the previous charters. The weekly market, though granted for Wednesday, was held as early as 1392 on Saturday. Elizabeth in 1565 granted the fair for seven days, and was ratified and extended with all previous grants, including the gild merchant, the weekly market on Saturday and the two annual fairs, in August for eight days and in October for seven days. Charles II. in 1662 and 1685 granted charters, by the latter of which an additional weekly market on Wednesday was conceded and a three days' fair beginning on the 16th of March. The most important industry used to be woolen weaving. Elizabeth's charter granted to the corporation all fees received from the selling of cloth within the borough, and in 1571 the mayor reported that the cloths usually made near Preston were "narrow white kearses." Other early industries were glove-making and linen cloth. The first cotton-spinning mill was built in 1777 in Moor Lane, and in 1791 John Horrocks built the Yellow Factory. In 1835 there were forty factories, chiefly spinning, yielding 70,000 lb. of cotton yarn weekly. A gild existed perhaps in Saxon times, but the grant of a gild merchant dates from Henry II.'s charter, about 1179. The first gild of which there was any record was celebrated in 1328, at which it was decided to hold a gild every twenty years. Up to 1542, however, they do not appear to have been very regularly celebrated, but

1 The Court leet was held twice a year up to 1835.
since that year they have been and still are held at intervals of twenty years. A special gild mayor is appointed on each occasion.

The first mention of a procession at the gild is in 1390. One of the most important items of business was the enrolment of freemen, and the gild rolls are records of the population. In 1397 the gild roll contained the names of over 200 burgesses and 100 foreign burgesses; in 1415 the number of in-burgesses was 188, which in 1450 had declined to 72. In 1582 there were over 500 in-burgesses and 340 out-burgesses. There is no evidence for, but rather against, the common statement that Preston was burnt or razed to the ground during the Scottish invasion of 1322. The town suffered severely from the Black Death in 1349-1350, when as many as 3,000 persons are said to have died, and again in the year November 1630 to November 1631, 1,100 died of pestilence. During the Civil War Preston sided with the king and became the headquarters of the Royalists in Lancashire. In February 1643, Sir JohnSon with a Parliamentary force marched from Manchester and successfully assaulted it. A strong Parliamentary garrison was established here and its fortifications repaired, but in March the earl of Derby recaptured the town. The Royalists did not garrison it, but after demolishing the greater part of the works left it unfortified. After the battle of Marston Moor Prince Rupert marched through Preston in September 1644 and carried the mayor and bailiffs prisoners to Skipton Castle, where they were confined for twelve months. On the 17th of August 1648 the Royalist forces under the duke of Hamilton and General Langdale were defeated at Preston by Cromwell with a loss of 1,000 killed and 4,000 taken prisoners. During the Rebellion of 1715 the rebel forces entered Preston on the 9th of November, and after proclaiming the Chevalier de St George king at the cross in the market-place, remained here for some days, during which the government forces advanced. The town was assaulted, and on the 14th of November General Forster surrendered his army of about 1,400 men to the king's forces. In 1745 Prince Charles Edward marched through on the way south and north, but the town took no part in the rebellion. The borough returned two members from 1205 to 1331, then ceased to exercise the privilege on account of poverty till 1529, but since that date (except in 1635) it has always sent two representatives to parliament. The curious institution of the mock mayor and corporation of Walton, which was at its foundation in 1701 a Jacobite association, ceased after 1706 to be of any political significance and lapsed in 1800. There was probably a church here in Saxon times and it is believed to be one of the three churches in Amounderness mentioned in Domesday Book. In 1004 it is named in a charter of Roger de Poictou. The early dedication was to St Wilfrid, but probably about 1351, when it was rebuilt, it was dedicated to St John. At the time of the Reformation, many, especially among the neighbouring gentry, clung to the old faith, and there is still a large Roman Catholic population.

There were two monastic foundations here: a hospital dedicated to St Mary Magdalene, which stood on the Maudlands, and a Franciscan convent of Grey Friars situated to the west of Friargate. In the 18th century Preston had a high reputation as a centre of fashionable society, and earned the epithet still familiarly associated with it, "proud.”

See H. Fishwick, History of the Parish of Preston (1800).

PRESTWICH, SIR JOSEPH (1812–1866), English geologist, was born at Clapham, Surrey, on the 12th of March, 1812. He was educated in Paris, Reading and at University College, London, where under Dr D. Lardner and Edward Turner, he paid special attention to natural philosophy and chemistry, and gained some knowledge of mineralogy and geology. Circumstances compelled him to enter into commercial life, and until he was sixty years of age he was busy engaged in the City as a wine merchant. He devoted all his leisure to geology. His business journeys enabled him to see and learn much of the general geology of England, Scotland and France, and this so effectively that at the time of his death he ranked as the most eminent of British geologists. As early as 1831 he commenced, during holiday visits, to make a study of the coal-field of Coalbrookdale in Shropshire, and the results of his observations were communicated to the Geological Society of London in 1834 and 1856, and embodied in a memoir published in 1838. His name is, however, especially known in connexion with his researches on the Eocene strata of the London and Hampshire Basins (1846–1857): he defined the Thanet Sands and the Woolwich and Reading Beds, and studied the sequence of deposits and the method of formation of these and the succeeding strata of London clay and Bagshot Beds. So highly appreciated were his essays on the subject that in 1849 he was awarded the Wollaston Medal by the Geological Society of London; and in 1853 he was elected F.R.S. In the course of his observations he was led to study questions of water supply and published in 1853 A Geological Inquiry respecting the Water-bearing Strata of the Country around London, a work that at once became a standard authority; and his extensive knowledge in that respect procured him a seat on the Royal Commission on Water Supply, appointed in 1858. From this position he exercised an influence never out of the way of his attention. On various occasions statements had been made as to the association of flint implements formed by man with the bones of extinct mammals which belonged to more remote periods than those generally assigned for the appearance of the human race on this earth, but the evidence adduced had usually been disregarded by geologists as not affording sufficient proof of the point. Prestwich, together with Dr Hugh Falconer and Sir John Evans, saw the desirability of a closer examination of the facts, particularly in regard to the implements discovered by Boucher de Perthes in the gravels of the Somme valley; and their investigations in France and England yielded evidence which proved that man existed contemporaneously with the Pleistocene mammalia (Phil. Trans. 1861 and 1864). In 1865 a Royal Medal was awarded to Prestwich by the Royal Society. In 1866 he was chosen one of the commissioners appointed to inquire into the several matters relating to coal in the United Kingdom; and he subsequently contributed an important Report on the Quantities of Coal, wrought and un wrought, in the Coalfields of Somersetshire and part of Gloucestershire, and another Report on the Probabilities of finding Coal in the South of England (1871). His researches on the Crag Beds of Suffolk and Norfolk, his report on Brixham Cave, his papers on the Channel Tunnel and the Chesil Bank, among others published during the years 1868–1875, may be mentioned.

In 1870 he married Grace Anne McCall (née Milne), niece of Dr H. Falconer, and author of the Harbour Bar and other works (see Essays Descriptive and Biographical, by Grace, Lady
PRESTWICH—PRETORIUS

PRESTWICH; edited by L. E. Milne, 1901. Prestwich retired from business in 1872, and two years later he was invited to take the chair of geology at Oxford, vacant through the death of John Phillips. This post he occupied until 1887. During his professorship he wrote his great work entitled Geology, Chemical, Physical and Stratigraphical (vol. i, 1886; vol. ii., 1888).

On leaving Oxford Prestwich spent his remaining years in his country house, Darent-Hulme, Shoreham, Kent, erected by him in 1869. There, although seventy-six years of age, he maintained marvellous activity in geological research, devoting his attention to the superficial deposits of the Darent valley, to the occurrence of palaeolithic flint implements in the valleys and of an earlier type since called eolithific, on the chalk plateau of Kent; he likewise dealt generally with the raised beaches and rubble-drift of the south of England and their relation to recent changes of level. His latest publications were Collected Papers on some Controversial Questions of Geology, and On Certain Phenomena belonging to the Close of the Last Geological Period and on their Bearing upon the Tradition of the Flood (1895).

He was knighted in 1896, and died on the 23rd of June in the same year, at Shoreham in Kent.

See Life and Letters of Sir Joseph Prestwich, edited by his wife (1899).

PRESTWICH, an urban district in the Prestwich parliamentary division of Lancashire, England, 5 m. N.W. of Manchester on the Lancashire & Yorkshire railway. Pop. (1901), 12,839. It possesses cotton manufactures, but consists chiefly of handsome mansions and villas inhabited by Manchester merchants.

PRETORIA, the administrative capital of the Union of South Africa and of the province of the Transvaal, 46 m. by rail N. by E. of Johannesburg. Pop. (1904) 36,830, of whom 21,114 were whites. Pretoria is situated on the banks of the Limpopo, and is 4,470 ft. above the sea, being 1,300 ft. lower than Johannesburg. Built in a hollow surrounded by hills, the aspect of the town with the river flowing through it and its broad streets lined with willows is picturesque. In summer the heat and moisture are excessive, and the Aapies (which is spanned by four bridges) is liable to floods.

The town is regularly laid out in rectangular blocks of uniform width. The older part lies on the west side of the Aapies River and between it and a smaller stream known as the Spruit. In the centre of this part of Pretoria is Church Square, so named from the Dutch Reformed Church which stood in it, but was demolished in 1905. Government buildings on the south side of the square contain the chambers of the Provincial Council and other public offices. They were erected in 1892 and are a handsome block in Renaissance style, three-storied, with a central tower surmounted by a statue of Liberty. On the north side of the square are the law courts, on the west side the Post Office. The chief banking offices are also in the square.

Running east and west from Church Square is Church Street, the chief business thoroughfare. A little east of Church Square, near Market Square, are the buildings of the Pretoria Post Office. Further west are the headquarters of the National Bank and of the Volksbank, and the Imperial National Bank. To the north are the buildings of the former Presidency, the residence of Paul Kruger, at the western end of the street near the Spruit. Opposite it is a branch of the Pretoria Savings Bank, and an extensive block of offices and workshops.

The former Presidency, the residence of Paul Kruger, at the western end of the street near the Spruit. Opposite it is the Dopper Church, in which Kruger used occasionally to preach. Other churches in the heart of the town include the Anglican cathedral, dedicated to St Alban, and the Presbyterian Church, both in Schoemans Street, the Roman Catholic Church in Kok Street with schools, convent buildings and extensive grounds, and the new Dutch Reformed Church in Vermeulen Street. In the north of the town is the National Museum and adjacent are the Zoological Gardens. Other public buildings are the government library, the University College and the opera house. East of the Aapies and on the residential districts of Arcadia, Sunnyside and Muckleneuk. Bryntirion, a suburb on the northern slopes of the hills, contains the residences of the chief officials, including Government House. Here is Melntjes Kop, with a broad natural stone shelf midway below the summit. This shelf was chosen in 1909 as the site of the public offices of the Union. The designs of Mr Herbert Baker were accepted for two large blocks of identical design connected by a semicircular colonnade (passing behind the narrow kloof which bisects the shelf). Besides other open spaces there is Burger's park, originally planned, during the first British occupation, as a botanical garden. It is beautifully wooded and through it runs the Spruit. A park and sports ground at the western end of the town contains the pedestal for a statue of President Kruger, and an arch to commemorate the Boer War, and appears to have been lost. Adjoining this park on the north is the cemetery. Among those buried there are Kruger and many of the British who fell during the war of 1899-1902. Signal Hill, near which are commemorated the Boer War, is a lofty hill above the plain, is west of the park. The plateau at its foot was the site of the English Innaag during the war of 1880-81, and is now occupied by the central railway station and workshops. North of the cemetery is the prison, a building which replaces a notoriously insanitary gaol used during the republican regime.

The water supply of Pretoria is drawn from the source of the Aapies River, where rise magnificent springs. The Fountains, as they are called, are 3 m. west of Pretoria. Some 3 m. north of the town is the Waterval, one of the only two of its kind in the district. At West Fort, 7 m. from the town, is a leper asylum; at Waterval, 15 m. north, the British prisoners captured by the Boers up to the fall of Pretoria were confined. The missle cast by the Boers of Pretoria is the Premier Diamond mine. Bronkhorst Spruit, where in December 1880 a detachment of British soldiers was ambushed by the Boers, lies about 30 m. east by south of the town.

History.—Pretoria was founded in 1855, the ground on which it stands being purchased by the Boer government from Marthinus Pretorius. It was made the centre of a new district created at the same time, both town and district being named in honour of Andries Pretorius. By treaty between the South African Republic (then comprising the districts of Potchefstroom, Rustenburg, Pretoria and Zoutpansberg) and the republic of Lydenburg, concluded at Pretoria in 1860, the two republics were united and Pretoria chosen as the capital of the whole state, and in September of that year the Volksraad held its first meeting in the new capital. Until 1864, however, when the civil war in the Transvaal ended, Potchefstroom remained the virtual capital of the country. From that year the seat of government has always been at Pretoria. There in 1877 Sir Theophilus Shepstone proclaimed the annexation of the Transvaal to Great Britain. In December 1880 it was invaded by the Boers, but held out until the conclusion of peace. In 1881 the convention restoring self-government to the Transvaal was signed at Pretoria. From that time until 1900 the dominating figure in the town was that of the president—Paul Kruger. As revenue flowed in from the gold-mines on the Rand many fine buildings were erected in the capital, which was placed in railway communication with Cape Town in 1893 and with Lourenco Marques and Durban in 1895. To Pretoria Dr Jameson and his troopers were brought prisoners (January 1896) after the fight at Doornkop (to be handed over in a few days to the British government), and thither also were brought the Reform Committee prisoners from Johannesburg. In May 1900 Kruger fled from the town, which on the 5th of June surrendered without resistance to Lord Roberts, despite its formidable encircling forts, which however were never effectively armed. On the 31st of May 1902 the articles of peace whereby the Boer leaders recognised British sovereignty were signed at Pretoria, and five years later there assembled in the capital the first Parliament of the Transvaal as a self-governing state of the British Empire. On the establishment of the Union of South Africa in 1910 Pretoria became its administrative capital, the seat of the legislature being however at Cape Town. The Transvaal parliament was replaced by a Provincial Council (see TRANSVAAL: § History).

The town is governed by a municipality, which since 1903 has acquired control of the sanitary service, water supply, electric lighting and tramways. In 1909 the proportional representation system was adopted for the election of town councillors.

PRETORIUS, the family name of two of the early leaders of the Trek Boers—Andries Wilhenuwms Jacobus Pretorius and Marthinus Wessels Pretorius, father and son.

1. ANDRIES PRETORIUS (1799-1853), a Dutch farmer of Graaff-Reinet, Cape Colony, and a descendant from one of the earliest Dutch settlers in South Africa, left his home in the Great
Trek, and by way of what is now the Orange Free State crossed the Drakensberg into Natal, where he arrived in November 1838, at a time when the emigrants were without a recognized general and speedily collected a force to avenge the massacre of Piet Retief and his party, who had been treacherously killed by the Zulu king Dingaan the previous February. Pretorius’s force was attacked on the 16th of December (“Dingaan’s Day”) by over 10,000 Zulus, who were beaten off with a loss of 3000 men. In January 1840 Pretorius with a commando of 400 burghers helped Mpande in his revolt against his brother Dingaan and was the leader of the Natal Boers in their opposition to the British. In 1842 he besieged the small British garrison at Durban, but retreated to Maritzburg on the arrival of re-inforcements under Colonel (subsequently Sir) Josias Clocote and afterwards exerted his influence with the Boers in favour of coming to terms with the British. He remained in Natal as a British subject, and in 1847 was chosen by the Dutch farmers there to lay before the governor of Cape Colony the grievances under which they laboured owing to the constant immigration of natives, to whom locations were assigned to the detriment of the Boers. In 1848 he was appointed a member of the Board of the Magistrate’s Court. Henry Pottinger (the governor) there was; but Sir Henry refused to see him or receive any communication from him. Pretorius returned to Natal determined to abandon his farm and once more trek beyond the British dominions. With a considerable following he was preparing to cross the Drakensberg when Sir Harry Smith, newly appointed governor of the Cape, reached the emigrants’ camp on the Tugela (Jan. 1848). Sir Harry promised the farmers protection from the natives and persuaded many of the party to remain, but Pretorius departed, and on the proclamation of British sovereignty up to the Vaal fixed his residence in the Magaliesberg, north of that river. He was chosen by the burghers living on both banks of the Vaal as their commandant-general. At the request of the Boers at Winburg Pretorius crossed the Vaal in July and led the anti-British party in their “war of freedom,” occupying Bloemfontein on the 20th of the same month. In August he was defeated at Boomplaats by Sir Harry Smith and thereupon retreated north of the Vaal, where he became leader of one of the largest of the parties into which the treacherous treachery of commandant-general of Potchefstroom and Rustenburg, his principal rival being Commandant-General A. H. Potgieter. In 1851 he was asked by the Boer malcontents in the Orange River Sovereignty and by the Basuto chief Moshe to come to their aid, and he announced his intention of crossing the Vaal to “restore order” in the Sovereignty. His object, however, was rather to obtain from the British an acknowledgment of the independence of the Transvaal Boers. The British cabinet having decided on a policy of abandonment, the proposal of Pretorius was entertained. A reward of £3000 which had been offered for his apprehension after the Boomplaats fight, was withdrawn. Pretorius met the British commissioners at a farm near the Sand River, and with them concluded the convention (Jan. 17, 1852) by which the independence of the Transvaal Boers was recognized by Great Britain. Pretorius recrossed the Vaal and at Rustenburg on the 26th of March was reconciled with Potgieter, the followers of both leaders approving the convention, though the Potgieter party was not represented at the Sand River. In the same year Pretorius paid a visit to Durban with the object of opening up trade between Natal and the new republic. He also in 1852 attempted to close the road to the interior through Bechuana and sent a commando to the western border against the Zulus. During this expedition David Livingstone’s house at Kolobong was looted. Pretorius died at his home at Magaliesberg on the 23rd of July 1853. He is described by Theal as “the ablest leader and most perfect representative of the Emigrant Farmers.” In 1855 a new district and a new town were formed out of the Potchefstroom and Rustenburg districts and named Pretoria in honour of the late commandant-general.

2. Martius Pretoirius (1819-1901), the eldest son of Andries, was appointed in August 1853 to succeed his father as commandant-general of Potchefstroom and Rustenburg, two of the districts into which the Transvaal was then divided. In 1854 he led his burghers against a chief named Makapan, who had murdered a party of twenty-three Boers, including ten women and children. The natives were blockaded in a great cave in the Zoutpansberg and about 3000 were starved to death or shot as they attempted to escape. Having thus chastised Makapan’s clan, Pretorius turned his energies to the creation of a strong central government, and from 1856 onward his dominating ideas appears to have been the formation of one Boer state to include the Orange River burghers. In December 1856 representatives of the districts of Potchefstroom, Rustenburg and Pretoria met and drew up a constitution and on the 6th of January the “South African Republic” was formally constituted Pretorius having been elected president on the previous day. Though the Boers of the Lydenburg, Utrecht and Zoutpansberg districts refused to acknowledge the new republic, Pretorius, with the active co-operation of Commandant Paul Kruger (afterwards President Kruger), endeavoured (1857) to bring about the union of the Orange Free State and the Transvaal, and a convention was signed at Pretoria under President Kruger. The convention at coercion failed, but in December 1859 the partisans of Pretorius in the Free State secured his election as president of that republic. Pretorius had just effected a reconciliation of the Lydenburg Boers with those of the other districts of the Transvaal, and hoping to complete his work of unification he accepted the presidency of the Free State, assuming office at Bloemfontein in February 1860. But the condition of anarchy into which the Transvaal fell shortly afterwards effectually weaned the Free State burghers from any thought of immediate amalgamation with their northern neighbours. Pretorius however continued to intervene in the affairs of the Transvaal and at length (April 15, 1863) resigned his Free State presidency. Acting as mediator between the various Transvaal parties Pretorius in January 1864 succeeded in putting an end to the civil strife and in May following once more became president of the South African Republic—now for the first time a united community. Conciliation was a marked feature of his character and to Pretorius more than any other man was due the welding of the various Transvaal districts into one state. He adhered to the ideas of his father and the Emigrant Farmers generally concerning the title of the state to indefinite expansion north, east and west. Although he had much difficulty in maintaining the authority of the republic over the natives within its recognized borders, yet in April 1868, on the report of gold discoveries at Tati, he issued a proclamation annexing the Transvaal to the west the whole of Bechuana and on the east territory up to and including part of Delagoa Bay. As to Delagoa Bay Portugal at once protested and in 1869 its right to the bay was acknowledged by Pretorius, who in the same year was re-elected president. The right of the Boers to the whole of Bechuanaland was not pressed by Pretorius in the face of British opposition, but in 1879, when the discovery of diamonds along the lower Vaal had led to the establishment of many diggers’ camps, an attempt was made to enforce the claims of the Transvaal to that district. Pretorius aroused the hostility of the diggers by granting an exclusive concession to one firm. Realizing his mistake, the concession was cancelled and in September 1879 he issued a proclamation notable as offering to the diggers very large powers of self-government. Pretorius went to the western frontier and in repeated conferences with the Bechuana chiefs attempted to get them to acknowledge the Boer contention and by joining the Transvaal to “save” their territory from the British. His diplomacy failed, and finally, without consulting his colleagues, he agreed to refer the question of the boundary to the arbitration of Mr. R. W. Keate, then lieutenant-governor of Natal. The award, given on the 17th of October 1871, was against the Boer claims. Pretorius, however, accepted the decision, but it aroused a storm of indignation in the Transvaal. The Volksraad refused to ratify the award and Pretorius resigned the presidency (November 1871).
From this time Pretorius took little further part in public affairs until after the first annexation of the state by Great Britain. In 1878 he acted as chairman of the committee of Boer leaders who were seeking the restoration of the independence of their country, and for his action in that capacity he was arrested in January 1880 by order of Sir Garnet Wolseley on a charge of treason. (See the Blue Book [C. 2584] of 1880 for details of this charge.) He was admitted to bail and shortly afterwards urged by Wolseley to accept a seat on the executive council. This offer Pretorius declined, but he consented to tour the country with a proclamation by Wolseley counselling the Boers to submit, and promising them self-government. In December of the same year he was appointed, with Paul Kruger and P. Joubert, to carry on the government on the part of the insurgent Boers. He was one of the signatories to the Pretoria Convention and continued to act as a member of the Triumvirate until the election of Kruger as president in May 1889. He then withdrew from public life; but lived to see the country re-annexed to Great Britain, dying at Potchefstroom on the 19th of May 1901. He is stated to have disapproved the later developments of Krugerism, and within four months of his death visited Louis Botha and Schalk Burger, on behalf of Lord Kitchener, with the object of bringing the war to an end.

PRETTY, a word usually applied in the sense of pleasing in appearance, without connoting those qualities which are described as beautiful or handsome. In Old English prettig meant tricky, cunning or wily, and is thus used to translate the Latin sagax, astius, calidus, in a vocabulary of about 1000. Prettig meant a trick, and this word is seen in many forms in Dutch, cf. the words prettig, sportive, port, trick. A connexion has been suggested with the Greek πράττειν, πράττειν, to do, make, through Latin praeter, practice, performance; but the New English Dictionary rejects these, as also Celtic sources, as unfounded. From "cunning" to skilful, and thence to its use as a term of general appreciation as is so often used by Pepys, the development is easy.

PREVARICATION, a divergence from the truth, equivocution, quibbling, a want of plain-dealing or straightforwardness, especially a deliberate misrepresentation by evasive answers, often used as a less offensive synonym for a lie. The Latin praevincio was specifically applied to the conduct in an action at law in which an advocate (praevinciator) in collusion with his opponent put up a bad case of defence. Praevinciator was thus often used for a court-tort; to straddle, hence to walk crookedly, to stray from the direct road, varicis, straddling, being derived from varus, bow-legged, a word which has been connected etymologically with German quer, transverse, across, and English "queer."

PREVEZA, or Prevest, a seaport of Albania, European Turkey, in the vilayet of Iannina; at the entrance to the Gulf of Arta, an inlet of the Ionian Sea. Pop. (1905), 6,500, of whom about four-fifths are Christian Albanians or Greeks, and one-fifth Moslems. The town is surrounded by dense olive groves, and most of its houses stand in their own gardens. The harbour is small, and closed to large vessels by a bar of sand; but it is a port of call for the Austrian Lloyd steamers, and annually accommodates about 1500 small vessels, the majority of which are engaged in the coasting trade. Preveza exports daily produce and hides, and produces salt, olives and olive oil. The yearly value of its trade varies from about £3,000 to £80,000. About 3 m. north are the ruins of Nicopolis (q.v.).

PRÉVOST, ANTOINE FRANÇOIS (1607-1763), French author and novelist, was born at Hesdin, Artois, on the 1st of April 1607. He first appears with the full name of Prévost d'Exiles in a letter to the booksellers of Amsterdam in 1731. His father, Liévin Prévost, was a lawyer, and several members of the family had embraced the ecclesiastical estate. Prévost was educated at the Jesuit school of Hesdin, and in 1713 became a novice of the order in Paris, pursuing his studies at the same time at the college of La Flèche. At the end of 1716 he left the Jesuits to join the army, but he soon tired of life in barracks, and returned to Paris in 1719 with the idea, apparently, of resuming his novitiate. He is said to have travelled in Holland about this time; in any case he returned to the army, this time with a commission. Some of his biographers have assumed that he suffered some of the misfortunes assigned to his hero Des Grieux. However, that he may have been, in 1719-1720 the learned community of the Benedictines of St Maur, with whom he found refuge, he himself says, after the unlucky termination of a love affair. He took the vows at Jumièges in 1721 after a year's novitiate, and received in 1726 priest's orders at St Germer de Fláix. He resided for seven years in various houses of the order, teaching, preaching and studying. In 1728 he was at the abbey of St Germain-des-Prés, Paris, where he was engaged on the translation of the works of Denys de Sainte-Marthe, who had been a member of their order. His restless spirit made him seek from the Pope a transfer to the easier rule of Cluny; but without waiting for the brief, he left the abbey without leave (1728), and, learning that his superiors had obtained a lettre de cachet against him, fled to England.

In London he acquired considerable knowledge of English history and literature, traceable throughout his writings. Before leaving the Benedictines Prévost had begun his most famous romance, the Histoire de Monseigneur de Conti, or Histoire de Monseigneur de Conti et de Manon Lescaut, which contained the first four volumes of which were published in Paris in 1728, and two years later at Amsterdam. In 1729 he left England for Holland, where he began to publish (Utrecht, 1730) a romance, and, relying on the popularity of his first book, published at Amsterdam a Suite in three volumes, forming volumes vi., vii. and xvi. of the original Mémoires et aventures d'un homme de qualité. The seventh volume contained the famous Manon Lescaut, separately published in Paris in 1731 as Les Aventures du chevalier des Grieux et de Manon Lescaut, par Monseigneur D... The book was eagerly read, chiefly in pirated copies, as it was forbidden in France. In 1733 he left the Hague for London in company with a lady whose character, as it afterwards appeared, was far from desirable. In London he edited a weekly gazette on the model of Addison's Spectator, Le Pour et contre, which he continued to produce, with short intervals, until 1740.

In the autumn of 1734 Prévost was reconciled with the Benedictines, and, returning to France, was received in the Benedictine monastery of Monseigneur de Conti, and the author of these essays was invited by Monsieur de Conti to accompany him to Paris to pass a few days with him at his country-seat of Evreux to pass through a new, though brief, novitiate. In 1735 he was dispensed from residence in a monastery by becoming almoner to the prince de Conti, and in 1754 obtained the priory of St Georges de Gesnes. He continued to produce novels and translations from the English, and, with the exception of a brief exile (1741-1742) spent in Brussels and Frankfort, he resided for the most part at Chantilly until his death, which took place suddenly while he was walking in the neighbouring woods on the 23rd of December 1763. Hideous particulars have been added, but the cause of his death, the rupture of an aneurism, has been definitely established. Stories of crime and disaster were related of Prévost by his enemies, and diligently repeated, but they have proved to be as apocryphal as the details given of his death.

Manon Lescaut, one of the greatest novels of the century, is very short, and is entirely clear in its intention, being prosecuted by the truest and most cunningly managed feeling; and almost every one of its characters is a triumph of that analytic portraiture which is the secret of the modern novel. The chevalier des Grieux, the hero, is probably the most perfect example of the carrying out of the sentiment "All for love and the world well lost" that exists in fiction, at least where the circumstances are those of ordinary and probable life. Tibeuf, his friend, is hardly inferior in the beauty of his action to the noble part of the man of letters. The heroine's brother, has vigorous touches as a bully and Bohemian; but the triumph of the book is Manon herself. Animated by a real affection...
for her lover, and false to him only because her love of splendour, comfort and luxury prevents her from welcoming privation with him or for him, though, in effect she prefers him to all others, perfectly natural and even amiable in her degradation, and yet showing the moral character most vividly, Manon is one of the most remarkable heroines in all fiction. She had no literary ancestress; she seems to have sprung entirely from the imagination, or perhaps the sympathetic observation, of the wandering scholar who drew her. The Bibliothèque des objets curieux can challenge comparison before her or near to her own date, and in *Manon Lescaut* the plot is much more complete and interesting, the sentiments less artificial, and the whole story nearer to actual life than in Madame de la Fayette's masterpiece. Prevost's other masterpieces include: *Le Doyen de Kiltêrêne*, *Histoire moderne*, composed on the mémoires d'une illustre famille d'Irland (Paris, 1735; 2nd part, the Hague, 1739, 3rd, 4th and 5th parts, 1740); *Tout pour l'amour* (1733), *Histoire de l'Amour moderne* (Amsterdam [Paris] 2 vols., 1740); *Histoire de Marguerite d'Anjou* (Amsterdam [Paris] 2 vols., 1740); *Mémoires pour servir à l'histoire de Malte* (Amsterdam, 1741); *Campagnes philosophiques, ou mémoires... contenant l'histoire de la guerre d'Irlande* (Amsterdam, 1741); *Histoire de Guillaume le Conquérant* (Paris, 1742); *Histoire générale des voyages* (15 vols., Paris, 1746-1759), continued by other writers; translations from Samuel Richardson, Pamela (4 vols., 1742). *Lettres anglaises ou Histoire de Miss Clarisse Harlowe* (6 vols., London, 1741); *Nouvelles lettres anglaises, ou Histoire du chevalier Grandisson* (Amsterdam, 3 vols., 1755); *Mémoires pour servir à l'histoire de la vertu* (Cologne, 4 vols., 1762). From Mrs Sherier's translation of *Histoire de Mme de Sillery* (Amsterdam, 1767). *Nouvelles Histoires de Stuart* (3 vols., 1740) from Hume's *History of England to 1688; Le Monde morale, ou Mémoires pour servir à l'histoire du cœur humain* (2 vols., Geneva, 1750), &c.

For the bibliography of Prevost's works, which presents many complications, and for documentary evidence of the facts of his life see H. Harriès, *L'Abbé Prevost* (1896); also a thesis (1898) by V. Schroeder.

**PRÉVOST, Constant** (1787–1856), French geologist, was born in Paris on the 4th of June 1787, and was son of Louis Prévost, receiver of the rents of that city. He was educated at the Central Schools, where, inspired by the lectures of G. Cuvier, Alexandre Brongniart and A. Duméril, he determined to devote himself to natural science. He took his degree in Letters and Sciences in 1811, and for a time pursued the study of medicine and anatomy. Mainly through the influence of Brongniart he turned his attention to geology, and during the years 1816–1819 made a special study of the Vienna Basin where he pointed out for the first time the presence of Tertiary strata there, which he published in the *Annales de Géologie* in 1820. His next work (1822) was an essay on the geology of parts of Normandy, with special reference to the Secondary strata, which he compared with those of England. From 1821–1829 he was professor of geology at the Atheneum at Paris, and he took a leading part with Ami Boué, G. P. Deshayes and Jules Desnoyers in the founding of the Geological Society of France (1830). In 1831 he became assistant professor and afterwards honorary professor of geology to the faculty of sciences. Having studied the volcanoes of Italy and Auvergne, he opposed the views of von Buch regarding craters of elevation, maintaining that the cones were due to the material successively erupted. Like Lyell he advocated a study of the causes or forces now in action in order to illustrate the past. One of his more important memoirs was *De la Chronologie des terrains et du synchronisme des formations* (1845). He died in Paris on the 17th of August 1856.

**PRÉVOST, Eugène Marcel** (1862—1915), French novelist, was born in Paris on the 1st of May 1862. He was educated at Jesuit schools in Bordeaux and Paris, entering the Ecole Polytechnique in 1883. He abandoned his studies there as soon as 1884, but for some years after the completion of his studies he applied his technical knowledge to the manufacture of tobacco. He published in succession, *Le Scorpion* (1887), *Chonette* (1888), *Mademoiselle Jauffre* (1886), *Cousine Laura* (1890), *La Confession d'un amant* (1891), *Lettres de femmes* (1892), *L’Automne d’une femme* (1893), and in 1894 he made a great sensation by an exaggerated and revolting study of the results of Parisian education and Parisian society on young girls, *Les Demi-vierges*, which was dramatized and produced with great success at the Gymnase on the 71st of May 1895. *Le Jardin secret* appeared in 1897, and in 1900 *Les Vierges fortes*, and a study of the question of women's education and independence in two novels *Frédérique* and *Léa*. *L’Héritage* (1901), *Les Lettres à Frédéric* (1901), *La Princesse d’Erminge* (1904), and *L’Accordeur aventure* (1905) are among his later novels. An amusing picture of modern German manners is given in his *Monsieur et Madame Moloch* (1906). He had a great success in 1904 with a four-act play *La Plus faible*, produced at the Comédie Française. In 1909 he was elected to the Academy.

**PRÉVOST, Pierre** (1753—1839), Swiss philosopher and physicist, son of a Protestant clergyman in Geneva, was born in that city on the 3rd of March 1753, and was educated for a clerical career. But he forsook it for law, and this too he quickly deserted to devote himself to education and to travelling. He became intimate with J. J. Rousseau, and, a little later, with Dugald Stewart, having previously distinguished himself as a translator of and commentator on Euripides. Frederick II. of Prussia secured him in 1780 as professor of philosophy, and made him member of the Akademie der Wissenschaften in Berlin. He there became acquainted with Lagrange, and was thus led to turn his attention to physical science. After some years spent on political economy and on the principles of the fine arts (in connexion with which he wrote, for the Berlin Memoirs, a remarkable dissertation on poetry) he returned to Geneva and began his work on magnetism and on heat. Interrupted occasionally in his studies by political duties, in which he was often called to the front, he remained professor of philosophy at Geneva till he was called in 1810 to the chair of physics. He died at Geneva on the 8th of April 1839.

Prévost published much on philosophy, political economy; but he will be remembered mainly for having published, with additions of his own, the *Traité de physique* of G. L. Le Sage, and for his enunciation of the law of exchange in radiation. His scientific publications included *De l'Origine des forces magnétiques* (1785), *Recherches physico-mécaniques sur la chaleur* (1792), and *Essai sur le coloriage rayonnant* (1809).

**PRÉVOST-PARADOL, Lucien Anatole** (1832–1870), French man of letters, was born in Paris on the 8th of August 1859. He was educated at the College Bourbon and entered the Ecole Normale. In 1855 he was appointed professor of French literature at Aix. He held the post, however, barely a year, resigning it to become a leader-writer on the *Journal des débats*. He also wrote in the *Courrier du dimanche*, and for a very short time in the *Presse*. His chief works are *Essais de politique et de littérature* (three series, 1850–1866), and *Essais sur les moralités* (1862). Few of his essays can claim to be more than a writer of books, and was one of the chief opponents of the empire on the side of moderate liberalism. He underwent the usual difficulties of a journalist under that regime, and was once imprisoned. In 1865 he was elected an Academician. The accession of Emile Ollivier to power was fatal to Prévost-Paradol, who apparently believed in the possibility of a liberal empire, and consequently accepted the appointment of envoy to the United States. This was the signal for the most unmeasured attacks on him from the republican party. He had scarcely installed himself in his post before the outbreak of war between France and Prussia occurred. He shot himself at Washington on the 11th of July 1870, and died on the 20th.

**Prey (O. Fr. proie, mod. proie. Lat. praedia, booty, from prae and the root hed—seen in prehendere, prendere, to grasp), booty, spoil, plunder taken in war, by robbery, or other violent means; particularly that which was killed for food by a carnivorous animal; a beast or bird of prey. A particular usage for that which is saved from any trial of strength or battle is familiar from the Bible (Jer. xxi. 6) "his life shall be unto him for a prey."

**Priam** (Gr. Ἵπαθος), in Greek legend, the last king of Troy, son of Laomedon and brother of Tithonus. Little is known of him before the Trojan War, which broke out when he was advanced in years. According to Homer (*Iliad*, iii. 184) in his
youth he fought on the side of the Phrygians against the Amazons. He had fifty sons and fifty daughters, and possessed immense wealth. He appears only twice on the scene of action during the war—to make arrangements for the duel between Paris and Menelaus, and to beg the body of Hector for burial from Achilles, whom he visits in his tent by night. He was said to have been slain by Neoptolemus, son of Achilles, during the sack of Troy (Virgil, Aeneid, ii, 532). See under Troy, on the legends.

PRIAPEIA, a collection of poems (about eighty in number) in various metres on the subject of Priapus. It was compiled from literary works and inscriptions on images of the god by an unknown editor, who composed the introductory epigram. From their style and versification it is evident that the poems belong to the best period of Latin literature. Some, however, may be interpolations of a later period. They will be found in F. Bücheler’s Petronius (1904), L. Miller’s Catullus (1870), and E. Bährrens, Poetae latini minores, 1. (1879).

PRIAPULOIDEA, a small group of vermiform marine creatures; they have been usually placed in the neighbourhood of the Gephyrea, but their position is uncertain and it is doubtful if they are to be regarded as coelomate animals. They are cylindrical worm-like animals, with a median anterior mouth quite devoid of any armature or tentacles. The body is ringed, and often has circles of spines, which are continued into the slightly protrusible pharynx. The alimentary canal is straight, and the anus terminal, though in Priapulus one or two hollow ventral diverticula of the body-wall stretch out behind it. The nervous system, composed of a ring and a ventral cord, retains its primitive connexion with the ectoderm. There are no specialized sense-organs or vascular or respiratory systems. There is a wide body-cavity, but as this has no connexion with the renal or reproductive organs it cannot be regarded as a coelom, but probably is a blood-space or haemocele.

The Priapulidea are dioecious, and their male and female organs, which are one with the excretory organs, consist of a pair of branching tufts, each of which opens to the exterior on one side of the anus. The tips of these tufts enclose a flame-cell similar to those found in Pfeifferminths, &c, and these probably function as excretory organs. As the animals become adult, diverticula arise on the tubes of these organs, which develop either spermatozoa or eggs. These pass out through the ducts. Nothing is known of the development. There are three genera: (i.) Priapulus, with the species P. caudatus, Lam., of the Arctic and Antarctic and neighbouring cold seas, and P. bicaudatus, Dan., of the Arctic seas; (ii.) Priapuloides australis, de Guerne, of the southern circumpolar waters; and (iii.) Halicyon, with the species H. spinulosus, v. Sieb., of the northern seas. They live in the mud, which they eat, in comparatively shallow waters up to 50 fathoms.

PRIAPUS, in Greek mythology, son of Dionysus (or Adonis or Hermes) and Aphrodite (or Chione). He is unknown to Homer and Hesiod. The chief seat of his worship was the coast of the Hellespont, especially at Lampsacus, which claimed to be his birthplace. Thence his cult extended to Lydia, and by way of the islands of Lesbos and Thasos to the whole of Greece (especially Argolis), whence it made its way to Italy, together with that of Aphrodite. Priapus is the personification of the fruitfulness of nature. Sailors invoked him in distress and fisherman prayed to him for success. He gradually came to be regarded as the god of sensuality. His symbol was the phallus, an emblem of productivity and a protection against the evil eye. The first fruits of the gardens and fields, goats, milk and honey, and occasionally ass, were offered to him. He was sometimes represented as an old man, with a long beard and large genitals, wearing a long Oriental robe and a turban or garland of vine-leaves, with fruit and bunches of grapes in his lap. Amongst the Romans, rough wooden images, after the manner of the hermae, with phallus stained with vermilion, were set up in gardens. His image was placed on tombs, as symbolizing the doctrine of regeneration and a future life, and his name occurs on sepulchral inscriptions. In his hand he carried a bill-hook or club, while a reed on his head, shaking backwards and forwards in the wind, acted as a scarerow.

PRIBILOF ISLANDS (often called the Fur Seal Islands, Russian equivalent, "Kotovi"), a group of four islands, part of Alaska, lying in Bering Sea in about 56° 50' N. and 170° W., about 200 m. N. of Unalaska and 200 m. S. of Cape Newenham, the nearest point on the mainland. The principal islands are St Paul (about 35 sq. m.; 13 m. long, from N.E. to S.W.; maximum width about 6 m.; named from St Peter and St Paul’s Day, on which it was discovered) and St George (about 27 sq.m.; 13 m. long, maximum width, 4 m.; probably named after Priapulid) about 30 m. S.E.; Otter and Walrus islets, the former covering about 4 sq. m., and the latter merely a reef covering about 64 acres, are near St Paul. In 1907 the native population was 263—170 on St Paul and 93 on St George. Only agents of the United States or employees of the lessees are permitted as residents on the islands. The islands are hilly and volcanic—Bogosof, a crater on St Paul, is 600 ft. high—without harbours, and have a mean annual temperature of about 35° F., and a rainfall of about 35 in. There are only two seasons—rainy summers lasting from May to October, and dry winters from November to April. The flora is restricted to ferns, mosses and grasses, though there are some creeping willows and small shrubs. The largest seal rookery, containing about 80% of the seals in the Pribilofs, is on St Paul. The seals found here are a distinct variety (Callorhinus ursinus) with much better fur than that of any other variety. Besides the fur seals there are blue and grey foxes (more on St George than on St Paul), and on St George Island and on the Walrus reef there are great bird rookeries—the breeding places of immense numbers of gulls, auks, parrots, auks, cormorants and arries (Lomvia arcto). The islands were first sighted in 1675 by Joan Syred, and were visited in 1786 by George Pribiloff, who discovered the fur seal rookeries for which they became famous. From Russia the islands passed with Alaska to the United States in 1867. From 1870 to 1890 the United States government leased the islands to the Alaska Commercial Company. In 1890-1910 the North American Commercial Company held the monopoly. But the industry shrank considerably owing to pelagic sealing. The season during which land hunting is allowed on the islands includes June, July, September and October. (See also SEAL and BERING SEA ARBITRATION.)

PRIBRAM, a town of Bohemia, Austria, 39 m. S.W. of Prague by rail. Pop. (1900), 13,576, together with the adjoining township of Birkenberg, 19,119, almost exclusively Czech. It lies in a valley between the hills of Birkenberg and Heiliger Berg, and in its neighbourhood are the lead and silver mines which belong to the Austrian government and are worked in nine shafts, two of which, the Adalbert shaft (3637 ft.) and the Maria shaft, (1575 ft.) are the deepest in the world. The mines have been worked for several centuries, but their actual prosperity dates from 1770, when the sinking of the Adalbert shaft began. They yield yearly an average of 80,000 lb. of silver, and 1900 tons of lead. At the top of the Heiliger Berg (1889 ft.) is a church with a wonder-working image of the Virgin, which is the chief place of pilgrimage in Bohemia.

PRICE, BARTholomew (1818-1898), English mathematician and educationist, was born at Cln St Denis, Gloucestershire.
in 1818. He was educated at Pembroke College, Oxford, of which he was a fellow (after taking a first class in mathematics in 1840 and gaining the university mathematical scholarship in 1843) he became professor of mathematics in 1845. He was a leading exponent of the teaching of the university, and published treatises on the Differential Calculus (1848) and the Infinitesimal Calculus (4 vols., 1852-1866), which were the recognized textbooks there. This latter work included the differential and integral calculus, the calculus of variations, the theory of attractions, and analytical mechanics. In 1853 he was appointed Scelliean professor of natural philosophy, resigning it in June 1868. His chief public activity at Oxford was in connexion with the hebdomadal council, and with the Clarendon Press, of which he was for many years secretary. He was also a curator of the Bodleian Library, an honorary fellow of Queen's College, a governor of Winchester College and a visitor of Greenwich Observatory. In 1861 he was elected Master of Pembroke College, which dignity carried with it a canonry of Gloucester Cathedral. He died on the 30th of December 1880.

PRICE, BONAMY (1807-1888), English political economist, was born at St Peter Port, Guernsey, on the 22nd of May 1807. He entered at Worcester College, Oxford, in 1822, where he took a double first in 1828. From 1830 to 1850 he was an assistant master at Rugby School. He then lived for some years in London, being engaged in business and literary work, and was appointed to serve on various royal commissions. He married in 1864. In 1868 he was elected Drummond professor of political economy at Oxford, and was thrice re-elected to the post, which he held till his death. In 1883 he was elected an honorary fellow of his college. In addition to his professorial work, he was in much request as a popular lecturer on political economy. He died in London on the 8th of January 1888. His principal publications, exclusive of pamphlets, were: The Principles of Currency (1860), Currency and Banking (1876), Chapters on Practical Political Economy (1878).

PRICE, RICHARD (1722-1791), English moral and political philosopher, son of a dissenting minister, was born on the 23rd of February 1722, at Tynsby, Glamorganshire. He was educated privately and at a dissenting academy in London, and became chaplain and companion to a Mr Streetfield at Stoke Newington. By the death of Mr Streetfield and of an uncle in 1750 his circumstances were considerably improved, and in 1757 he married Miss Sarah Blundell, originally of Belgrave in Leicestershire. In 1767 he published a volume of sermons, which gained him the acquaintance of Lord Shelburne, an event which had much influence in raising his reputation and determining the character of his subsequent pursuits. It was, however, as a writer on financial and political questions that Price became widely known. In 1769, in a letter to Dr Franklin, he wrote some observations on the expectation of lives, the increase of mankind, and the population of London, which were published in the Philosophical Transactions of the Royal Society. In March 1776 he communicated to the Royal Society a paper on the proper method of calculating the values of contingent reversions. The publication of these papers is said to have exercised a beneficial influence in drawing attention to the inadequate calculations on which many insurance and benefit societies had recently been formed. In 1769 Price received the degree of D.D. from the university of Glasgow. In 1771 he published his Appeal to the Public on the Subject of the National Debt (ed. 1772 and 1774). This pamphlet excited considerable controversy, and is supposed to have influenced Pitt in re-establishing the sinking fund for the extinction of the national debt, which had been created by Walpole in 1716 and abolished in 1733. The means, however, which Price proposed for the extinction of the debt are described by Lord Overstone as "a sort of hocus-pocus machinery," supposed to work "without loss to any one," and consequently unsound.

Price then turned his attention to the question of the American colonies. He had from the first been strongly opposed to the war, and in 1776 he published a pamphlet entitled Observations on Civil Liberty and the Justice and Policy of the War with America. Several thousand copies of this work were sold within a few days; a cheap edition was soon issued; the pamphlet was extolled by one set of politicians and abused by another; amongst its critics were Dr Markham, archbishop of York, John Wesley, and Edmund Burke; and Price rapidly became one of the best-known men in England. He was presented with the freedom of the city of London, and it is said that his pamphlet had no considerable share in determining the Americans to declare their independence. A second pamphlet on the war with America, the debts of Great Britain, and kindred topics followed in the spring of 1777. His name thus became identified with the cause of American independence. He was the intimate friend of Franklin; he corresponded with Turgot; and in the winter of 1778 he was invited by Congress to go to America and assist in the financial administration of the states. This offer he refused from unwillingness to quit his own country and his family connexions. In 1781 he received the degree of D.D. from Yale College.

One of Price's most intimate friends was Dr Priestley, in spite of the fact that they took the most opposite views on morals and metaphysics. In 1778 appeared a published correspondence between these two liberal theologians on the subjects of materialism and necessity, wherein Price maintains, in opposition to Priestley, the free agency of man and the unity and immateriality of the human soul. Both Price and Priestley were the workmen most vaguely called "Unitarians," though they occupied respectively the extreme right and the extreme left of that position. Indeed, Price's opinions would seem to have been rather Arlian than Socinian.

The pamphlets on the American War made Price famous. He preached to crowded congregations, and, when Lord Shelburne acceded to power, not only did the former offer the post of secretary of state to him, but it is said that one of the paragraphs in the king's speech was suggested by him and even inserted in his words. In 1786 Mrs Price died. There were no children by the marriage, his own health was failing, and the remainder of his life appears to have been clouded by solitude and dejection. The progress of the French Revolution alone cheered him. On the 19th of April 1791 he died, worn out with suffering and disease.

The philosophical importance of Price is entirely in the region of ethics. The Review of the Principal Questions in Morals (1757, ed. revised 1772), which is divided into chapters, the first of which, though a small part of the whole, completes his demonstration of ethical theory. The remaining chapters investigate details of minor importance, and are especially interesting as showing his relation to Butler and Kant (ch. iii. and ch. vii.). The work is professedly a refutation of Hutcheson, but is rather constructive than polemical. The theory he propounds is closely allied to that of Kant, differing mainly in comparison with the subsequent theories of Kant.

I. Right and wrong belong to actions in themselves. By this he means, not that the ethical value of actions is independent of their results, but that a principle is not only unaffected by consequences, and that it is more or less invariable for intelligent beings. II. This ethical value is perceived by reason or understanding (which, unlike Kant, he does not distinguish), intuitively, and without any experience. III. The moral principle is driven back to the admission that right actions must be "grateful to us;" that, in fact, moral approbation includes both an act of the understanding and an emotion of the heart. Still it remains true that this principle is not an essentially moral law, but merely a guide. In this conclusion he is in close agreement with Kant; reason is the arbiter, and right is (1) not a matter of the emotions and (2) not relative to imperfect human nature. Price's main point of difference with Hudscworth is that while Cudworth regards the moral criterion as a sýmía or modification of the mind, existing in germ and developed by circumstances, Price regards it as acquired from the contemplation of actions, but acquired necessarily, immediately, intuitively. In his view of disinterested action (ch. iii.) he adds...
nothing to Butler. III. Happiness he regards as the only end, conceivable by us, of divine Providence, but it is a happiness wholly dependent upon rectitude. Virtue tends always to happiness, and in the end must produce it in its perfect form.

Works.—Besides the above-mentioned, Price wrote an Essay on the Population of England (2nd ed., 1780); two Fast-Days Sermons, published respectively in 1779 and 1781; and Observations on the importance of the American Revolution and the means of rendering it a benefit to the United States. A complete list of his works is given in an appendix to Dr Priestley's Funeral Sermon. His views on the French Revolution are denounced by Burke in his Reflections on the Revolution in France. Notices of Price's ethical system occur in Mackintosh's Progress of Ethical Philosophy, Jouffroy's Introduction to Ethics, Whewell's History of Moral Philosophy in England; Bain's Mental and Moral Sciences. See also Ethics, and T. Fowler's monograph on Shaftesbury and Hutcheson. For Price's life see memoir by his nephew, William Morgan. (J. M. J.)

PRICE, the equivalent in money for which a commodity is sold or purchased, the value of anything expressed in terms of a medium of exchange (see Value and Wealth). The word is a doublet of "praise," commendation, eulogy, Lat. laus, and "prize," a reward of victory, the ultimate source of which is the Lat. praemium; the Aryan root prā, to buy, is seen in Skr. prātra, a price. Gr. prōtēmos, to buy or sell. The O. Fr. prēs, mod. prix, was taken from a Late Latin form præxium, and had the various meanings of the English, "price," "prize," and "praise"; it was adapted in English as priz or prise and was gradually differentiated in form for the different meanings; thus "praise" was developed from an earlier verbal form præse or præxy in the 15th century; the original meaning survives in "appraise," to set a value to anything, cf. the current meaning of "to prize," to value highly. "Prize," reward, does not appear as a separate form till the 16th century. In "prize-fight," a boxing contest for money, the idea of reward seems clear, but the word appears earlier than the form "prize" in this sense and means a contest or match, and may be a different word altogether; the New English Dictionary compares the Greek use of ἀθλον, literally reward, hence contest. "Prize" in the sense of that which is captured in war, especially at sea, is a distinct word. It comes through the Fr. prise, early Romanic presa for præxa, from Lat. praehendere, to seize, capture. For the international law on the subject see Prize.

PRICHARD, JAMES COWLES (1786-1848), English physician and ethnologist, was born on the 11th of February 1786 at Ross in Herefordshire. His parents were of the Society of Friends, and he was educated at home, especially in modern languages and general literature. He adopted medicine as a profession mainly because of the facilities it offered for anthropological investigations. He took his M.D. at Edinburgh, afterwards reading for a year at Trinity College, Cambridge, whence, joining the Church of England, he migrated to St John's College, Oxford, afterwards entering as a gentleman commoner at Trinity College, Oxford, but taking no degree in either university. In 1810 he settled at Bristol as a physician, and in 1813 published his Researches into the Physical History of Man, in 2 vols., afterwards extended to 5 vols. The central principle of the book is the primitive savage stock which the present-day races have since divided it into separate varieties or races. The work is dedicated to Blumenbach, whose five races of man are adopted. But where Prichard excelled Blumenbach and all his other predecessors was in his grasp of the principle that people should be studied by combining all available characters. One investigation begun in this work requires special mention, the bringing into view of the fact, neglected or contradicted by philologists, that the Celtic nations are allied by language with the Slavonian, German and Pelas- gian (Greek and Latin), thus forming a fourth European branch of the Asiatic stock (which would now be called Indo-European or Aryan). His special treatise containing Celtic compared with Sanskrit words appeared in 1831 under the title Eastern Origin of the Celtic nations. It is remarkable that the essay by Adolphe Pictet, De l'Affinité des langues celtiques avec le sanscrit, which was crowned by the French Academy and made its author's reputation, should have been published in 1837 in evidence ignorance of the earlier and in some respects stricter investigations of Prichard.

In 1843 Prichard published his Natural History of Man, in which he reiterated his belief in the specific unity of man, pointing out that "the same inward and mental nature is to be recognized in all the races." Prichard may fairly be honoured with the title of the founder of the English branch of the sciences of anthropology and ethnology. In 1811 he was appointed physician to St Peter's hospital, Bristol, and in 1814 to the Bristol infirmary. In 1822 he published Treatise on Diseases of the Nervous System (pt. 1), and in 1835 a Treatise on Insanity and other Disorders affecting the Mind, in which he advanced the theory of the existence of a distinct mental disease, "moral insanity." In 1842, following up this suggestion, he published On the different forms of Insanity in relation to Jurisprudence designed for the use of Persons concerned in Legal Questions regarding Unsoundness of Mind. In 1845 he was made a commissioner in lunacy, and removed to London. He died there three years later, on the 23rd of December, of rheumatic fever. At the time of his death he was president of the Ethnological Society and a fellow of the Royal Society. Among his less important works were: A Review of the Doctrine of a Vital Principle (1829); On the Treatment of Hemiplegia (1831); On the Extinction of some Varieties of the Human Race (1830); Analysis of Egyptian Mythology (1831).

See Memoir by Dr Thomas Hodgkin (1798-1866) in the Journal of the Ethnological Society (Feb. 1849); Memoir read before the Bath and Bristol branch of the Provincial Medical and Surgical Association (March 1849) by Dr J. A. Symonds (Journ. Eth. Soc., 1850); Prichard and Symonds in Special Relation to Mental Science, by Dr Hack Tuke (1851).

PRICK POSTS, an old architectural name given sometimes to the queen posts of a roof, and sometimes to the filling in quarters in framing. (See Post and Pane.)

PRIDE, THOMAS (d. 1658), parliamentarian general in the English Civil War, is stated to have been brought up by the parish of St Bride's, London. Subsequently he was a drayman and a brewer. At the beginning of the Civil War he served as a captain under the earl of Essex, and was gradually promoted to the rank of colonel. He distinguished himself at the battle of Preston, and with his regiment took part in the military occupation of London. In 1658, in his last step towards bringing the king to trial. The second was the expulsion of the Presbyterian and Royalist elements in the House of Commons, for which Pride is chiefly remembered. This, resolved by the army council and ordered by the lord general, Fairfax, was carried out by Colonel Pride's regiment. Taking his stand at the entrance of the House of Commons with a written list in his hand, he caused the arrest or exclusion of the obnoxious members, who were pointed out to him. After about a hundred members had been thus dealt with ("Pride's Purge"), the mutinied House of Commons proceeded to bring the king to trial. Pride was one of the judges of the king and signed his death-warrant, appending to his signature a seal showing a coat of arms. He commanded an infantry brigade under Cromwell at Dunbar and Worcester. He took no conspicuous part in Commonwealth politics, except in opposing the proposal to confer the kingly dignity on Cromwell. He was knighted in 1656, and was also chosen a member of the new House of Lords. Having purchased a house at Newmarket, an estate which he had bought in Surrey, on the 23rd of October 1658. After the Restoration his body was ordered to be dug up and suspended on the gallows at Tyburn along with those of Cromwell, Ireton and Bradshaw, though it is said that the execution of this sentence was evaded.

Noble, Lives of the Regicides; Bate, Lives of the Prime Actors and Principal Contemporaries of the Murder of Charles I.; Carlyle, Cromwell's Letters and Speeches.

PRIDEAUX, HUMPHREY (1648-1724), English divine and Oriental scholar, was born of good family at Place, in Gornwall, on the 3rd of May 1648, and received his early education at the grammar schools of Liskeard and Bodmin. In 1665 he was placed at Westminster under Busby, and in 1668 went on to
PRIE, MARQUISE DE—PRIEST

Christ Church, Oxford, where he took his degrees in the following order: B.A., 1674; M.A., 1675; B.D., 1682; and D.D., 1686. His account of the famous Arundel marbles just given to the university appeared in 1676. In 1679 he was appointed to the rectory of St Clement's, Oxford, and Hebrew lecturer at Christ Church, where he continued until February 1686, holding for the last three years the rectory of Bladen with Woodstock. In 1686 he exchanged for the benefice of Saham in Norfolk. The sympathies of Prideaux inclined to Low Churchism in religion and to Whiggism in politics, and he took an active part in the controversies of the day, publishing the following pamphlets: ‘The Validity of the Orders of the Church of England’ (1688), ‘A Letter to a Friend on the Present Convocation’ (1690), ‘The Case of Clandestine Marriages stated’ (1691). Prideaux was promoted to the archdeaconry of Suffolk in December 1688, and the deanery of Norwich (which he had long been one of the canons) in June 1692. In 1694 he was obliged, through ill health, to resign the deanship of Saham, and after having held the vicarage of Trowse for fourteen years (1696–1710) he found himself incapacitated from further parochial duty. He died at Norwich on the rst of November 1724.

Many of the dean’s writings were of considerable value. His Life of Mahomet (1697) was really a political tract against the deists and has no biographical value. Both it and his Directions to Churchwardens (1701) passed through several editions. Even greater was his Old and New Testament connected in the History of the Jews (1716), a work which not only displayed but stimulated research. Biographical details of his numerous publications and of his manuscripts are given in the Bibliotheca Cornubiana, ii, pp. 157–159, and iii. 1359. A volume of his letters to John Ellis, some time under-secretary of state, was edited by E. M. Thompson for the Camden Society in 1875; they contain a vivid picture of Oxford life after the Restoration. An anonymous life (probably by Thomas Birch) appeared in 1748; it was mainly compiled from information furnished by Prideaux’s son Edmund.

PRIE, JEANNE AGNES BERTHELOT DE PLÉNEUF, MARQUISE DE (1668–1727), French adventureress, was the daughter of a rich but unscrupulous father and an immoral mother. At the age of fifteen she was married to Louis, marquis de Prié, and went with him to the court of Savoy at Turin, where he was ambassador. She was twenty-one when she returned to France, and was soon the declared mistress of Louis Henri, duc de Bourbon. During his minority (1725–1727) she was in several respects the real ruler of France, her most notable triumph being the marriage of Louis XV. to Marie Leszczynska instead of Mlle de Vermandois. But when, in 1727, she sought to have Bourbon’s rival Fleury exiled, her ascendency came to an end. After Fleury’s recall and the banishment of Bourbon to Chantilly Mme de Prié was exiled to Courtbipéne, where she committed suicide the next year.

See M. H. Thirion, Madame de Prié (Paris, 1906).

PRIE-DIEU, literally ‘pray God,’ strictly a prayer desk, primarily intended for private use, but often found in churches of the European continent. It is a small ornamental wooden desk furnished with a sloping shelf for books, and a cushioned kneeling piece. It appears not to have received its present name until the early part of the 17th century. At that period in France a small room or oratory was sometimes known by the same name. A similar form of chair, in domestic furniture, is called prie-dieu by analogy.

PRIEGO DE CORDOBA, a town of southern Spain in the extreme S.E. of the province of Cordova, near the headwaters of the river Guadalquivir, and on the northern slope of the Sierra de Priego. Pop. (1900), 16,902. The district abounds in cattle and mules, and is also a centre of agricultural products, especially wine and oil. The local industries include tanning and manufacturing of esparto fabrics, rugs and collecting goods. The oldest church was built in the 13th century and subsequently restored; it has a fine chapel. There are ruins of an old castle—Priego having been a fortified city of the Moors which was captured by the Christians in 1226, lost again, and finally retaken in 1407.

PRIENE (mod. Samosun kale), an ancient city of Ionia on the foot-hills of Mycale, about 6 m. N. of the Maeander. It was formerly on the sea coast, but now lies some miles inland. It is said to have been founded by Ionians under Aegyptus, a son of Neleus. Sacked by Ardy of Lydia, it revived and attained great prosperity under its ‘ sage,’ Bias, in the middle of the 6th century. Cyrus captured it in 545; but it was able to send two vessels to join the Ionian revolt (500–494). Disputes with Samos, and the troubles after Alexander’s death, brought Priene low, and Rome had to save it from the kings of Pergamum and Cappadocia in 168. After the Parthian, the rebellious brother of the Cappadocian king, who had deposited a treasure there and recovered it by Roman intervention, restored the temple of Athena as a thankoffering. Under Roman and Byzantine dominion Priene had a prosperous history. It passed into Moslem hands late in the 13th century. The ruins, which lie on successive terraces, were the object of missions sent out by the English Society of Dilettanti in 1750 and 1862, and have been thoroughly laid open by Dr Th. Wiegand (1857–1859) for the Berlin Museum. The city, as rebuilt in the 4th and 3rd centuries, was laid out on a rectangular scheme. It faced south, its acropolis rising nearly 200 ft. behind it. The whole area was enclosed by a wall 7 ft. thick with towers at intervals and three principal gates. On the lower slopes of the acropolis was a shrine dedicated to Demeter. The town had six main streets, about 20 ft. wide, running east and west and fifteen streets about 10 ft. wide crossing at right angles, all being evenly spaced; and it was thus divided into about 10,000 insulae. Private houses were apportioned four to an insula. The systems of water-supply and drainage can easily be discerned. The houses present many analogies with the earliest Pompeian. In the western half of the city, on a high terrace north of the main street and approached by a fine stairway, was the temple of Athena Polias, a hexastyle peripteral Ionic structure built by Pythis, the architect of the Mausoleum. Under the basis of the statue of Athena were found in 1870 silver tetradrachms of Orophernes, and some jewelry, probably deposited at the time of the Cappodocian restoration. Fronting the main street is a series of halls, and on the other side is the fine market place. The municipal buildings, Roman gymnasium, and well preserved theatre lie to the north, but, like all the other public structures, in the centre of the plan. Temples of Isis and Asclepius have been laid bare. At the lowest point on the south, within the walls, was the large stadium, connected with a gymnasium of Hellenistic times.

See Society of Dilettanti, Ionian Antiquities (1821), vol. ii.; Th. Wiegand and H. Schrader, Priene (1904); on inscriptions (360) see H. von Gall, Inscriptionen von Priene (Berlin, 1867), with collection of ancient references to the city. (D. G. H.)

PRIEST (Ger. Priester, Fr. prêtre), the contracted form of “presbyter” (presbyteros, “elder”; see PRIESTER), a name of office in the early Christian Church, already mentioned in the New Testament. But in the English Bible the presbyters of the New Testament are called “elders,” not “priests;” the latter name is reserved for ministers of pre-Christian religions, the Semitic קָרָן (qərān, sing. qīhān) and κηρύῳ (kerúx, the Greek ἱερέας, and the Greek ἱερέας (hieréas). The reason of this will appear more clearly in the sequel; it is enough to observe at present that, before our English word “priest” was formed, the original idea of a presbyter had been overlaid with ideas derived from pre-Christian priesthoods, so that it is from these and not from the etymological force of the word that we must start in considering historically what a priest is. The theologians of the Greek and Latin churches expressly found the conception of the Christian priesthood on the hierarchy of the Jewish Church, while the names by which the sacerdotal character is expressed—lēpis, sacerdos—originally designated the ministers of sacred things in Greek and Roman heathenism, and then came to be used as translations into Greek and Latin of the Hebrew kohen. Kohen, lēpis, sacerdos, are, in fact, fair translations of one another; they all denote a minister whose stated business was to perform, on behalf of the community, certain public ritual acts, particularly sacrifices, directed godwards. Such ministers or priests existed in all the great religions of ancient civilization. The term
"priest" is sometimes taken to include "sorcerer," but this use is open to criticism and may produce confusion.

The close inter-relation which existed in primitive society between magic, priesthood and kingship has been indicated by Frazer in his *Early History of the Kingship*. His remarks throw some light on the early character of priesthood as well as kingship. "When once a special class of sorcerers has been segregated from the community and entrusted by it with the discharge of duties on which the public safety and welfare are believed to depend, these men gradually rise to wealth and power till their leaders blossom out into sacred kings." According to Frazer's view, "as time goes on the fallacy of magic becomes more and more apparent and is slowly displaced by religion; in other words the magician gives way to the priest. Hence the king starting as a magician tends gradually to exchange the practice of magic for the functions of prayer and sacrifice." We are not concerned here with the debatable question whether magic preceded religion. Probably magic was always accompanied by some primitive form of animism whether the Melanesian mana or fetishism (see Dr. Haddon's *Magic and Fetishism*, pp. 53-62, 64-90).

The investigations which have been carried on in recent years by King, Tallquist and Zimmern, as well as by Brünnow and Craig, on the magic and ritual of Babylonia and Assyria have been fruitful of results. The question, however, remains to be settled how far the officials and their functions, which in the much more highly developed civilization of Babylonia came to be differentiated and specialized, can be strictly included under the functions of priesthood. The answer to this question will be in many cases negative or affirmative according to our strict adherence or the reverse to the definition of the priest set forth above as "a minister whose stated business it was to perform on behalf of the community certain ritual acts in some cases sacrifices (or the recitation of prayers), directed Godwards." On the other hand the seer, diviner and prophet is a minister whose function is to communicate God's will or word to man. This is not a distinction which governs Zimmern and other writers. Our chief source of information is Zimmern's *Beiträge zur Kenntnis der Babyloniens Religion*, pp. 81-95, from which Lagrange in his *Études sur les religions sémitiques* has chiefly derived his materials (ch. vi. p. 222 sqq.) respecting Babylonia and Assyria. Zimmern's results are summarized in K.A.T., p. 380 sqq. Here we find magic and soothsaying closely interwoven with priestly functions as, we shall see, was the case in early Hebrew pre-exilic days with the Kohen. It must be borne in mind that primitive humanity is not governed by logical distinctions. Among the Babylonians and Assyrians the bara (from bara to see, inspect) was a soothsaying priest who was consulted whenever any important undertaking was proposed, and addressed his inquiries to Samaš the sun god (or Adad) as il il or lord of the oracle (accompanied by the sacrifice of lambs). The signs were usually obtained from the inspection of the liver (according to Jons, that of the lamb that was sacrificed); or it took place through birds; hence the name in this case given to the bara. Magi (see *below*) spent their time in the temple to repair them as a distinct functionary. Sometimes divination took place through vessels filled with fire and oil (see Omen and Divination).

As contrasted with the bara or soothsaying priest, as he is called by Zimmern, we have the ašipu, who was the priest-magician who dealt in conjurations (šiptu), whereby diseases were removed, spells broken, or in expiations whereby sins were expiated. Tallquist's edition of the *Mabû* series of incantations and his explanations of the ritual, and also the publications by Zimmern of the Surpu series of tablets in his *Beiträge* have rendered us familiar with the functions of the ašipu. See article "Magic" in Hastings's *Dict. Bible*, where examples are given of incantations with magical by-play. Also compare Jastrow's *Religion of Babylonia* (1893), ch. xvi., "The Magical Texts," where a fuller treatment will be found. Now, as the conjurations were addressed to the deity, ašipu, according to the definition given above, comes more reasonably under the category of priest. But the priest belongs to the realm of religion, proper, which involves a relation of dependence on the superior power, whereas the ašipu belongs to the realm of magic, which is coercive and seeks "to constrain the hostile power to give way" (Lagrange).

There was also a third kind of priest called the *sammaru*, whose function it was to sing hymns.

In the earlier period of the Assyrian monarchy we find the king holding the office of *pa-tet-ši* or *išakbu* or (more definitely) the *šan-ų, i.e. priest of Ahur, the patron-deity of Assyria. This high-priestly office towards the tutelary deity of the nation appears to have belonged to the king by virtue of his royal rank. In Babylonia under the last empire (except in the case of Nebuchadrezzar, who calls himself *pa-tesi šir*, "exalted priest," *K.I.B.* ii. p. 60) no such high-priestly function attached to the king, for in Babylonia the priesthoods were endowed with great wealth and power, and even the king stood in awe of them (see Johns, *Babylonian and Assyrian Laws, Contracts and Letters*, p. 212 sqq.). These powerfully-organized priesthoods, as well as the elaborate nature of their ritual and the multiplicity of the offices, might have easily impressed the exiled Jewish community. Thus arose the more developed system of Ezekiel's scheme (xl-xlviii.) of the Priestercodex and the high dignity which became attached to the person of the High Priest (reflected in the narrative of Uzziah's leprosy in 2 Chron. xxvi. 16-26). Other parallels to the sacerdotal system of the Priestercodex may here be noted. (1) According to Zimmern the *bara* and the ašipu formed close guilds and the office passed from father to son. This is certainly true of the *šangātu* or priesthood, which was connected with a special family attached to a particular temple and its worship. (2) Johns also points out the existence of the rab-barā, chief soothsayer, and the rab-masmātu or chief magician. (3) Bodily defects (as squinting, lack of teeth, maimed finger) was disqualifications for priesthood (cf. Lev. xxi. 17 sqq.). (4) In the ritual tablets for the ašipu published in Zimmern's *Beiträge*, No. 26, col. iii. 19 sqq., we read "that the masmātu (priest's magician) is to pass forth to the gateway, sacrifice a sheep in the palace gateway, and to smear the threshold and posts of the palace gateway right and left with the blood of the lamb." We are reminded of Exod. xii. 7 (P). (5) The Babylonian term kuppuru (infin. Pael.) is used of the magician-priest or ašipu and means "wipe out." This confirms the view that the Hebrew kipper, which appears to be a late word (specially employed in Ezek., and P.), originally had the meaning which belongs to the Aramaic viz. "wipe off" and not "cover" as in Arabic. Zimmern thinks that the meaning "atone" or "expiate," which belongs to the Pael form of the root k-p-r in both Aramaic and Arabic was borrowed from the Babylonian (cf. Driver’s note in "Deuteronomy," Int. Commentary, p. 425 sqq. and especially his article "Propitiation" in Hastings’s *Dict. Bible*).

The Rev. C. H. W. Johns, to whom reference has already been made, demands (in a communication to the writer) that the same man might unite all three functions in one person. Thus a šangātu had a definite share in the offerings, a masmātu a different share. It seems to me that the priests belonged to the old families who were descended from the original tribe or city that founded them and that they could not admit outsiders by adoption into the family. If a new god had a temple set up he had a new set of priests, but this priesthood descended in its line, e.g. a Samaš priest did not beget a man who became a priest for another temple but "proceeded on the same line." A soothsayer was a general practitioner in his art, not attached to any one god or temple. Anyone could be a ramku who actually poured out liberations; that a priest usually did it was no exception to the rule. The priest offered prayer, interceded, &c. I cannot see that he taught. An oracle of the god came through him. If the *modus operandi* was akin to soothsaying it was only because that special form of soothsaying was peculiar to the particular cult of that god, and even this as a secondary development. I do not think that early priests received oracles save in dreams, &c. That magic early invaded religion is possible, but there are many traces of it being a foreign element. This is not usually pointed out.
Priest

Among the ancient Egyptians the local god was the protector and lord of the district. Consequently it was the interest and duty of the inhabitants to maintain the cultus of the patron-deity of their city who dwelt in their midst. Moreover, in the earlier times we find the prince of the nome acting as the High Priest of the local god, but in course of time the state, represented by the king, began to an ever-increasing degree to take oversight over the more important local cults. Thus we find that the Egyptian monarch was empowered to exercise priestly functions before all the gods. We constantly see him in the wall-paintings portrayed as a priest in the conventional attitudes before the images of the gods. In the chief sanctuaries the chief priests possessed special privileges, and it is probable that those in the immediate entourage of the king were elected to these positions. The highest sanctuaries in the nome sought the honour of having in the service of their local deity. One such class, called signer heb were charged with reciting the divine formulae, which were popularly held to possess magical virtue. In the middle empire (VIIIth to XIIth Dynasties) the lay element maintains its position in religious cultus despite its complexity. But under the new empire (Dynasties XVIIIth and following) the professional priest had attained to ominous power. The temples possessed larger estates and became more wealthy. Priests increased in number and were divided into ranks, and we find them occupying state offices, just as in Babylonia the priests acts as judge or inspector of canals (Johns, Babylon and Assyrian Laws, &c., p. 213).

We now turn to the priesthood as we find it in ancient Greece and India. In historical times, priestly power was presided over by special priests who preside over ritual acts in the temples in which they are attached; but his kings also do sacrifice on behalf of their people. The king, in fact, both in Greece and in Rome, was the acting head of the state religion, and when the regal power came to an end his sacred functions were not transferred to the ordinary priests, but either they were distributed among high officers of state, as archons and prytanes, or the title of "kings" was still preserved as that of a religious functionary, as in the case of the res sacrorum at Rome and the archon basileus at Athens. In the domestic circle the union of priesthood and national headship was never disturbed; the Roman paterfamilias sacrificed for the whole family. On the other hand, genii and phratriae, which had no natural head, had special priests chosen from their members; for the whole circle of ancient society, in which the family up to the state, was religious as well as social, it had its gods, good and sacred rites. The lines of religious and civil society were identical, and, so long as they remained so, no antagonism could arise between the spiritual and the temporal power. In point of fact, in Greece and Rome the priest never attained to any considerable independent importance; we cannot speak of priestly power and hardly even of a distinct priestly class. In Greece the priest, so far as he is an independent functionary and not one of the magistrates, is simply the elected or hereditary minister of a temple charged with "those things which are ordained to be done towards the gods" (see Aristotle, Pol. vi. 8), and remunerated from the revenues of the temple, or by the gifts of worshippers and official dues. The position was one of considerable honour and importance, and the priests were under the special protection of the gods they served. But their purely ritual functions gave them no means of establishing a considerable influence on the minds of men, and the technical knowledge which they possessed as to the way in which the gods could be accepted approached was neither so intricate nor so mysterious as to give the class a special importance. The funds of the temples were not in their control, but were treated as public moneys. Above all, where, as at Athens, the decision of questions of sacred law fell not to the priests but to the college of ἔγγραφοι, one great source of priestly power was wholly lacking. There remains, indeed, one other sacred function of great importance in the ancient world in which the Greek priests had a share. As man approached the gods in sacrifice and prayers, so too the gods declared themselves to men by divers signs and tokens, which it was possible to read by the art of Divination (q.t.). In many nations divination and priestly function have always gone hand in hand; at Rome, for example, the augurs and the XV vīri sacrorum, who interpreted the Sibylline books, were priestly colleges. In Greece, on the other hand, divination was not generally a priestly function, but it did belong to the priests of the Oracles (see Oracle). The great oracles, however, were of Panhellenic celebrity and did not serve each a particular state, and so in this direction also the risk of an independent priestly power within the state was avoided.

In Rome, again, where the functions of the priesthood were politically much more weighty, where the technicalities of religion were more complicated, where priests interpreted the will of the gods, and where the pontiffs had a most important jurisdiction in sacred things, it was much too strong for these powers to escape from its own immediate control: the complete supremacy of the king in sacred things descended to the inheritors of his temporal power; the highest civil and religious functions met in the same persons (cf. Cic. De dom. i. 1); and every priest was subject to the state exactly as the magistrates were, referring all weighty matters to state decision and then executing what the one supreme power decreed. And it is instructive to observe that when the plebeians extorted their full share of political power they also demanded and obtained admission to every priestly college of political importance, to those, namely, of the pontiffs, the augurs, and the XV vīri sacrorum. The Romans, it need hardly be said, had no hereditary priests.

We can only glance briefly at the ancient religions of India (see Essay, p. 213). In historical times the priesthood is rigidly confined to members of the Brahman caste, who are regarded as the representative of God on earth. But there are indications that at an earlier date the Kshatriya or warrior caste often became priests. The power of the priesthood began with the delegation by the king of his sacrificial duties to a priest (puhīta). This power grew with the growing importance of the sacrifice and the complication of its ceremonial. In the post-Vedic period "right" or "wrong" simply means the exact performance or the neglect, whether intentional or unintentional—of all the details of a prescribed ritual, the centre of which was the sacrifice. At this period the priestly caste gained its unbounded power over the minds of men (Professor Rapson). For further details as to the development of the priestly caste and its power in India the reader must refer to Brahmanism; here it is enough to observe that among a religious people which forms a close and still more an hereditary corporation, and the assistance of which is indispensable in all religious acts, must rise to practical supremacy in society except under the strongest form of despotism, where the sovereign is head of the Church as well as of the state.

Among the Zoroastrian Iranians, as among the Indian Aryans, the aid of a priest to receive the sacrificial liturgy was necessary at every offering (Herod. i. 132), and the Iranian priests (āthra-vans, later Magi) claimed, like the Brahmans, to be the highest order of society; but a variety of conditions were lacking to give them the full place of their Indian brethren. Zoroastrianism is not a nature religion, but the result of a reform which never, under the old empire, thoroughly penetrated the masses: and the priesthood, as it was not based on a priestly tradition, did not form a strict hereditary caste. It was open to any one to obtain entrance into the priesthood, while on the other hand it was only as a priest that he could exercise sacerdotal functions, for these were strictly reserved to priests. Accordingly the clergy formed a compact hierarchy not inferior in influence to the clergy of the Christian middle ages, had great power in the state, and were often irksome even to the great king.

1 For the Greek priests, see, besides Schömann and others works on Greek antiquities, Newton, Essays on Art and Archaeology, p. 136 seq. (from epigraphic material). See also for Greek as well as Roman priests art. "Sacerdos" (Sacerdotes) in Warre Cornish's Concise Dict. of Greek and Roman Antiquities.
2 On the Roman priests, see in general Marquardt, Römische Staatsverwaltung, vol. iii., and for the pontiffs in particular the art. "Sacerdos" in Warre Cornish's Concise Dict. also Pontifex.
But the best established hierarchy is not so powerful as a caste, and the monarchs had one strong hold on the clergy by retaining the patronage of great ecclesiastical places, and another in the fact that the Semitic provinces on the Tigris, where the capital lay, were mainly inhabited by men of other faith.1

The duties of the priests were not restricted to the services of the temple, but they also took part in the household cults. The ritual had a mechanical character and was by no means attractive. It is impossible to enter into the manifold details of the fire cult which forms the main part of the worship in the Avesta. They belong to an earlier period than the Zoroastrian, nor was this fire cult restricted to the temples. Portable fire altars were carried about and the worship could be celebrated in any spot. It may be noted that in all the ceremonies in the religion of the Avesta, incantations, prayers and confessions play a very large part. The prevailing element in the incantations consists in the excorials of demons. In fact, the Persian religion throughout all its multitude of purifications, observances and expiations was a constant warfare against impurity, death and the devil. Amid all the ceremonialism of its priesthood there were also high ideals set forth in Zoroastrian religion of what a priest should be. Thus we read in Vendidad xvii.,

"Many there be, noble Zarathustra, who bear the mouth bandage, who have yet not girded their loins with the law. If such a one says ' I am an Ahravan ' he lies, call him not Ahravan, noble Zarathustra, said Ahura Mazda, but thou shouldest call him priest, noble Zarathustra, who sits awake the whole night through and years for holy wisdom that enables man to stand on death's bridge fearless and with happy heart, the wisdom whereby he attains the holy and glorious world of paradise."2

In this rapid glance at some of the chief priesthoods of antiquity, we have hitherto passed over the pure Semitic, whose priesthoods call for closer examination because of the profound influence which one of them—that of the Jews—has exercised on Christianity, and so on the whole history of the modern world. But before we proceed to this it may be well to note one or two things that come out by comparison of the systems already before us. Priestly acts—that is, acts done by one and accepted by the gods on behalf of many—are common to all the religions of antiquity and cannot be lacking where the primary subject of religion is not the individual but the community. But the origin of a separate priestly class, distinct from the natural heads of the community, cannot be explained by any such broad general principle; in some cases, as in Greece, it is little more than a matter of convenience that part of the religious duties of the state should be confined to special ministers charged with the care of particular temples, while in others the intervention of a special priesthood is indispensable to the validity of every religious act, so that the priest ultimately becomes a mediator and the vehicle of all divine grace. This position, we see, can be reached by various paths: the priest may become indispensable through the growth of ritual observances and precautions too complicated for a layman to master, or he may lay claim to special nearness to the gods on the ground, it may be, of his race, or, it may be, of habitual practices of purity and asceticism which cannot be combined with the duties of ordinary life, as, for example, celibacy was required of priestesses of Vesta at Rome. But the highest developments of priestly influence are hardly separable from something of magical superstitition, the opus operatum of the priest has the power of a sorcerer's spell. The strength of the priesthood in Chaldaea and in Egypt stands plainly in the closest connection with the survival of a magical element in the state religion, and Rome, in like manner, is more priestly than Greece, because it is more superstitious. In most cases, however, where a ancient civilization shows us a strong priestly system we are unable to make out in any detail the steps by which that system was elaborated; the clearest case perhaps is the priesthood of the Jews, which is not less interesting from its origin and growth than from the influence exerted by the system long after the priests were dispersed and their sanctuary laid in ruins.

Among the nomadic Semites, to whom the Hebrews belonged before they settled in Canaan, there has been never been any developed priesthood. The acts of religion partake of the general simplicity of desert life; apart from the private worship of household gods and the worship connected with the sanctuaries and priestesses of the kinsmen, the ritual observances of the ancient Arabs were visits to the tribal sanctuary to salute the god with a gift of milk, first-fruits or the like, the sacrifice of firstlings and vows (see Nazarites and Pasover), and an occasional pilgrimage to discharge a vow at the annual feast and fair of one of the more distant holy places (see Mecca). These acts required no priestly aid; each man slew his own victim and divided the sacrifice in his own circle; the share remaining was the pious offering, and was made over to the beside stone (nosh, ghabhab) set up as an altar or perhaps as a symbol of the deity. It does not appear that any portion of the sacrifice was burned on the altar, or that any part of the victim was consumed. It is not even to be supposed that there was a sacrificial priesthood, but each temple had one or more doorkeepers (sādīn, bāhīb), whose office was usually hereditary in a certain family and who had the charge of the temple and its treasures. The sacrifices and offerings were acknowledgment of divine bounty and means used to insure its continuance: the Arab was the "slave" of his god and paid him tribute, as slaves used to do to their masters, or subjects to their lords; and the free Bedouin, trained in the desert ways, was the "master" of his god, and acknowledged no other lord before which his own should bend. It would be hard to imagine a more friendly and respectful attitude toward the deity in which the god might be uttered in a prayer which the skilled could read, or conveyed in the inspired word of the oracle. The oracle, as it is called, was the name of the sanctuary, in which the sacred lot was administered for a fee by the sādān. The sanctuary thus became a seat of judgment, and here, too, compacts were sealed by oaths and sacrificial ceremonies. Throughout the desert, where the inhabitants lived in scattered groups for almost an age when the old faith was falling to pieces, are certainly very ancient. The fundamental type of the Arabian sanctuary can be traced through all the Semitic lands, and so appears to be older than the typical Semitic sanctuary: even the technical terms are merely the product of new, more refined ideas, but it may be taken, so we may justly assume that the more developed ritual and priesthoods of the settled Semites sprang from a state of things not very remote from what we find among the heathen Arabs. For the Alexandrian and the Arabian, we have seen, were of the same order, the sacrifices of the individual, or of a mass of individuals gathered in a great feast, but still doing worship each for himself and his own private circle; the only public aspect of religion is found in connexion with divination. If the temple was the whole circle, the temple was already subsumed in an earlier state. In Greece and Rome the public sacrifices were the chief function of religion, and in them the priesthood represented the ancient kings. But in the desert there is no king and no sovereignty of that of the divine oracle, and therefore is from soothsayer or priest who is the highest in religion or possibly nature. With the beginning of a settled state the temples must rise in importance and all the functions of revelation must be centered in the priest, and the worship becomes more complex (especially as sacrifice in antiquity is a common preliminary to the consultation of an oracle), but the public ritual will still remain closely associated with oracle or divination, or with temple feasts.

That this was what actually happened may be inferred from the fact that the Canaanite and Phoenician name for a priest (kāḥēm) is identical with the Arabic kāhīm, a 'soothsayer.' Soothsaying was also modern importation in Arabia; its characteristic form—a monotonous cordon of short rhyming clauses—is the same as was practised by the Hebrew "wizards who peeped and muttered" in the days of Isaiah, and that this form was native in Arabia is clear from its having a technical name (saj'), which in Hebrew survives only in the word used by the sages to describe the seer's trance. The kāhām, therefore, is not a degraded priest but such a soothsayer as is found in most primitive societies, and the Canaanite priests grew out of him. The only form of revelation or oracle appears to have existed in every great shrine of Canaan and Syria, and the importance of this element in the cultus may be measured from the fact that at Hierapolis it was the charge of the priest, just as in the Archeological legislations. But the use of "kāhām" for "priest" in the Canaanite and Phoenician points to more than this: it is connected with the mystic character of Canaanite religion. The soothsayer differs from the priest of an oracle by giving his revelation under excitement and often in a frenzy all manner of nonsense. In the same way the necessary physical accomplishment of an alaustus, which though it seems supernatural to a rude people, is really akin to poetic inspiration.

1 Cf. especially Noldeke's Tabari, p. 450 seq.

2 Mēshūgā; 2 Kings xix. 11, Jer. xxix. 26—meta of contempt applied to prophets. (See Hebrew Religion.)

3 For examples, see Palmyra and El Hibanes; see further, Lucian, De dea Syria, 36, for Hieropolis; Zosimus i. 58, for Aphaea; Pliny, N. xii. 58 (compared with Lucian, ut supra, and Movers, Phoeniciar. ii. 695), for the temple of Melkart at Tyre.
But it is soon learned that a similar physical state can be produced artificially, and at the Canaanite sanctuaries this was done on a large scale. We see from 1 Kings xvii., 2 Kings x., that great Baal temples had two classes of ministers, koḥanim and neannual, and that this provision seems to have been such a priesthood, primarily denotes a soothsayer, so that the latter are also a kind of priests who do sacrificial service with a wild ritual of their own. How deeply the orgastic character was stamped on the priesthoods of these peoples we can still see in the testimony of the Hebrew and Roman accounts, such as that of Appuleius (Metam. bk. viii.).

The Hebrews, who made the language of Canaan their own, took also the Canaanite name for a priest. But the earliest forms of Hebrew priesthood were not Canaanite in character; the priest, as he appears in the earlier records of the time of the Judges, Eli at Shiloh, Jonathan in the private temple of Micah and at Dan, is much like the sādin and not in the koḥanim.1 The whole structure of the sanctuaries of Canaanite, as it will be shown later, of a federation of Arab tribes, and the religious ordinances are scarcely distinguishable from those of Arabia, save only that the great delverance of the Exodus and the period when Moses, sitting in the way, passed judgment on the city, had impressed the sovereignty of Jehovah on all the tribes, had created an idea of unity between the scattered settlements in Canaan such as the Arabs before Mahomet never had. But neither in civil nor in religious life was this ideal unity expressed in fixed institutions, the old individualism of the Semitic nomad still held its ground. Thus the firstlings, first-fruits and vows are still the free gift of the individual which no human authority exacts, and which every household present and accountable considered as his own. As in Arabia, the ordinary sanctuary is still a sacred stone (יהוה = nôb) set up under the open heaven, and here the blood of the victim is poured out as an offering to God (see especially 1 Sam. xiv. 34, and cf. 2 Sam. xxiii. 16, 17). The priest has no place in this. It is an image, a picture of a temple, such as was always found here and there in the land for the custody of sacred images and palladion or other consecrated things (the ark at Shiloh, 1 Sam. iii. 3; image in Micah's temple. Judges xvii. 5; Goliath's sword lying behind the "ephor" or phallic image at Nob, 1 Sam. xii. 9; no doubt also money, a sin the Canaanite temple at Shechem, Judges ix. 4). Such treasures a guardian; but, above all, wherever there was a temple there was an oracle, a king, and a priest. All the latter could only be drawn where the temple was an "ephor" or priest (1 Sam. xiv. 18, Sept., and xxiii. 6 seq.). The Hebrews had already possessed a temple-tempel and oracle of this kind in the wilderness (Exod. xxviii. 7 seq.), of which Moses was the priest and Joshua the aedilus, and ever since that time the judgment of God through the priest at the sanctuary had a greater weight than the word of the ark, and was the ultimate solution of every controversy and claim (1 Sam. ii. 22; Exod. xxviii. 1, 2; 1 Kings v. 2; Judges iii. 1; 1 Sam. vii. 17; 1 Kings xiv. 8; 1 Kings xvi. 13; 1 Sam. xiv. 2; 1 Sam. xii. 11; 1 Sam. xiv. 22; etc.). The temple at Shiloh, where the ark was preserved, was the lineal descendant of the Mosaic sanctuary —for it was not the place but the palladium and its oracle that were the essential thing—and its priests claimed kin with Moses himself. In the temple at Shiloh was kept the ark and sacred image, so visited from beyond Mt Ephraim; and every man or tribe that cared to provide the necessary apparatus (ephor, teraphim, &c.) and hire a priest might have a temple and oracle of his own at which to consult Jehovah (Judges xvii., xviii.); but there was hardly another sanctuary of equal dignity. The priest of Shiloh is a much greater person than Micah's priest Jonathan; at the great feast he sits enthroned by the doorway, preserving decorum among the worshippers; he has certain legal dues, and, if he is disposed to exact more, no one ventures to resist (1 Sam. ii. 12 seq., where the text needs a slight correction). The priestly position of the prophets of the two Samuels (Judg. v. 11; Shiloh and the ark, and it was members of this house who consulted Jehovah for the early kings until Solomon deposed Abiathar. Indeed, though priesthood was not yet tied to one family, so that Micah's son, or Elazar of Nebiim, could all be priests, a Levite—that is, a man of Moses' tribe—was already preferred for the office elsewhere than at Shiloh (Judges x. 13), and such a priest naturally handed down his place to his porter's son (Judg. vii. 20).

Ultimately, indeed, as sanctuaries were multiplied and the priests all over the land came to form one well-marked class, "Levite" and legitimate priest became equivalent expressions, as is explained in the deuteronomic legislation. It is an easy inference that the priests at Shiloh or of Jonathan at Dan and the priesthood of the Levites as described in Deut. xxxiii. 8 seq. there lies a period of the inner history of which we know almost nothing. It is plain that the nuum priests (Judg. v. 11) were not Levites as are still so reckoned (1 Kings iv. 12 seq.); on the contrary, the decisions of the sanctuary had grown up into a body of sacred law, which the priests administered according to a traditional precedent. Accordingly to Semitic ideas there was a union of law and moralizing, or exorcizing, or blessing, or cursing, and the royal executive came into no collision with the purely declaratory functions of the priests. The latter, on the contrary, must have grown in importance with the unification and progress of the nation, so that in all the important sanctuaries into one class went hand in hand with a consolidation of legal tradition. And this work must have been well done, for, though the general corruption of society at the beginning of the Assyrian period there were still men who knew what was the spirit and the manner of priestly function (as, e.g., the prophet); but the public sanctuaries, the investiture of the house of David, and the restoration of the cult in its ancient form at least at Shiloh and the ark were no longer significant. With the prosperity of the nation, and especially the through the absorption of the Canaanites and of the local priesthoods, the capital was the royal sanctuary at Jerusalem, and in the royal sanctuaries at least there were regular public offerings maintained by the king and presented by the priests (cf. 2 Kings xvi. 15). Private sacrifices, too, could hardly be offered without some priestly aid, that such ritual was more complex; the priests of Deut. xviii. as to the priestly duties is certainly ancient, and shows that besides the tribute of first-fruits and the like the priests had a fee in kind for each sacrifice, as we find to have been the case among the Phoenicians at Sardis and among the Persians. They were in a similar case. Their judicial functions also brought profit to the priests, fines being exacted for certain offences and paid to them (2 Kings xii. 16; Hos. iv. 8; Amos ii. 8). The greater priestly offices were therefore in private hands as well as in those of the king. In the royal sanctuaries there were among the king of the people of the realm (2 Sam. viii. 18; 2 Kings x. 7, xii. 2); minor offices in the sanctuaries were in the patronage of the great priests and were often miserable enough, they were indeed of a much higher rank than the Levites. They could also the kings (2 Kings xii. 7; Deut. xviii. 8). That at least the greater offices were hereditary —as in the case of the sons of Zadok, who succeeded to the royal priesthood in Jerusalem after the fall of Abimelech and restored to their ancient dignity the service was then constituted, but there is not the slightest trace of an hereditary hierarchy, although that existed as such. The sons of Zadok, the priests of the royal chapel, were the king's personal representatives; they had an absolute independence of the rest; their office could only be filled by the descendant of the family, whether from the temple, which was in the days of Moses (Deut. x. 8, xviii. 1 seq.).

The steps which prepared the way for the post-exilic hierarchy, the destruction of the temple and its renovation by the Persian kings, are mentioned in the book of Chronicles. The priesthood of the spiritual prophets against the corruptions of popular worship, which issued in the reformation of Josiah, the suppression of the provincial shrines of Judah and the transference of their ministers to Jerusalem, the successful resistance of the sons

---

1 This appears even in the words used as synonyms for "priest" (Lev. iv. 16; 2 Sam. xxiv. 18; Ps. cv. 12; 1 Sam. vi. 15; the name of the old Aramaic, 1 Sam. viii. 13; 15; exactly corresponds to sādin and kābōh. That of the priest is כְּנֶסֶת (כְּנֶסֶת), which is the Canaanite name for a priest, for that out of the multiplicity of words for soothsayers and the like common to Hebrew and Arabic (either formed from a common root or expressing exactly the same idea), we find that only כְּנֶסֶת (כְּנֶסֶת) should have chosen the same one independently to mean a priest in view of the great difference in character between old Hebrew and Canaanitic priesthoods, incoercible. Indeed, there is no certain evidence of the national religion. This, in fact, is the old Aramaic word for a priest (with suffix article, kumād). Its origin is obscure. In the Aramaic papyri discovered near Assuan (Syene) כְּנֶסֶת is priest of the royal temple, כְּנֶסֶת, priest of the temple of Shilo, כְּנֶסֶת, priest ofSet Tet Set, and in Sachau's P. I. line 5, כְּנֶסֶת definitely means the priests of the god Hnabb. This coincides with the Hebrew use of the term כְּנֶסֶת priests, Hos. x. 5; Zeph. i. 4; 2 Kings xxiii. 5. 13; 2 Kings vi. 18. The priest had nothing to do with sacrifice, whether those who burned the fat were the worshippers themselves or some subordinate ministers of the Temple. Certainly it was not the "priest" who did so, for he in this sanctuary is always of a whole generation, and

2 See 1 Sam. ii. 36, a passage written after the hereditary dignity of the sons of Zadok at Jerusalem was well established.
of Zadok to the proposal to share the sanctuary on equal terms with these new-comers, and the theological justification of the degradation of the latter to the position of mere servants in the Temple supplied by Ezekiel soon after the captivity, need not here be dealt with. Further, in the next generation, after the formal division of the two priesthoods and the relation of Aaronids to Zadokids will be found briefly discussed in Emeq. Bib. vol. iii. cols. 3843–3845. Cf. Hastings's Dict. Bible, iv. 72–75; Camb. Bib. Essays (1909), pp. 100 seq., 112 seq. Cf. compare how different the profane functions of the 8th century speak of the judicial or “teaching” functions of the priests and of the ritual of the great sanctuaries. For the latter they have nothing but condemnation, but the former they acknowledge as part of the divine order of the state; while the profane functions of the High Priest and prince. From the foundation of the Hasmonian state to the time of Herod the history of the high-priesthood merges in the political history of the nation; from Herod onward the priestly aristocracy has lost its chief hold over the nation and expired in vain controversy with the Pharisees.

The influence of the Hebrew priesthood on the thought and organization of Christendom was the influence not of a living institution, for it hardly began till after the fall of the Temple, but of the theory embodied in the later parts of the Pentateuch. Two points in this theory were laid hold of—the doctrine of priestly mediation and the system of priestly hierarchy. The first forms the text of the principal argument in the Epistle to the Hebrews, in which the author easily demonstrates the inadequacy of the priesthoods of the Old Testament, and builds upon this demonstration the doctrine of the effective high-priesthood of Christ, who, in his sacrifice of himself, truly “led His people to God,” not leaving them outside as He entered the heavenly sanctuary, but taking them with Him into spiritual nearness to the throne of grace. This argument leaves no room for a special priesthood in the Christian Church, and in fact nothing of the kind is found in the oldest organization of the new community. The idea that presbyters and bishops are priests and the successors of the Old Testament priesthood first appears in full force in the writings of Cyprian, and here it is not the notion of priestly mediation but that of priestly power which is insisted on. Church office is a copy of the old hierarchy. Now among the Jews, as we have seen, the hierarchy proper has for its necessary condition the destruction of the state and the bondage of Israel to a foreign prince, so that spiritual power is the only basis left for a national aristocracy. The same conditions have produced similar spiritual aristocracies again and again in the East in more modern times, and even in antiquity more than one Oriental priesthood took a line of development similar to that which we have traced in Judea. Thus the hereditary priests of Kozab (Kôzê) were the chief dignitaries in Idumaea at the time of the Jewish conquest of the country (Jos. Ant. xv. 7, 9), and the High Priest of Hierapolis wore the princely purple and crown like the High Priest of the Jews (De dea syria, 42). The king's insignia of the High Priest of the sun at Emesa are described by Herodian (v. 3, 3), in connexion with the history of Elagabalus, whose elevation to the Roman purple was mainly due to the extraordinary local influence of his sacerdotal place. Other examples of priestly princes are given by Strabo in speaking of Pessinos (p. 567) and Obles (p. 672). As no such hierarchy existed in the West, it is plain that if the idea of Christian priesthood was influenced by living institutions as well as by the Old Testament that influence must be sought in the East (cf. Lightfoot, Philippians, p. 261). The function of the bishop, so far as it is derived from the idea of the high-priesthood, was connected with the view that the Eucharist (p. 87) is a propitiatory sacrifice which only a consecrated priest can perform. It is sufficient to remark here that the presentation of the sacrifice of the mass came to be viewed as the essential priestly office, so that the Christian presbyter really was a sacerdos in the antique sense. Protestants, in rejecting the sacrifice of the mass, deny also that there is a Christian priesthood “like the Levitical,” and have either dropped the name of “priest” or use it in a quite emasculated sense. For further details as to the history and doctrine of priesthood in Christendom the reader is referred to the article, “Priest: Priesterweihen in der Christlichen Kirche,” in P.R.E., 3rd ed., Bd. xvi. p. 47 sqq.

There is probably no nature religion among races above mere savagery which has not had a priesthood; but an examination of other examples would scarcely bring out any important

3 Cf. the impression which the ritual produced on the Greeks, Bernays's Theophrastus, pp. 85, 111 seq.
PRIESTLEY

PRIESTLEY, JOSEPH (1733-1804). English chemist and Nonconformist minister, was born on the 13th of March 1733 at Fieldhead, a hamlet near Birstal in the West Riding of Yorkshire. He was the eldest of a family of six. His father, Jonas Priestley, a woolen-cloth dresser of moderate means, was the son of a member of the Established Church, but both he and his wife, the only daughter of a farmer named Swift, were Nonconformists. Three years after the death of Mrs Priestley in 1739, Joseph's father's sister, Mrs Keighley, took him to live with her, and sent him at the age of twelve to a neighbouring grammar school. In his holidays he learned Hebrew from Mr Kirkby, a dissenting minister at Heckmondwike, who so frequently took entire charge of his education. From the age of sixteen to nearly twenty his health was so unsatisfactory that he attended neither school nor college, but worked at Chaldée and Syriac, began to read Arabic, and mastered 'S Gravesande's Natural Philosophy, together with various textbooks of logic and metaphysics. An uncle having promised him a place in a counting-house at Lisbon, he also learned French, German and Italian to fit himself for the post. But his aunt was anxious for him to be a minister, as he himself desired, and therefore in 1752, when his health had improved, he went to Daventry to attend the Nonconformist academy formerly carried on by Dr P. Doddridge at Northampton. There he stayed three years, exchanging his early Calvinism for a system of 'necesarism' under the influence of D. Hartley's Observations on Man and Theological Essays on the Principles of Human Liberty. In 1755 he was appointed to a small congregation at Neatham Market, in Suffolk, where he was not very successful. In 1758 he obtained a more congenial congregation at Nantwich, where he opened a school at which the elementary lessons were varied with experiments in natural philosophy. Three years later he removed to Warrington as classical tutor in a new academy, and there he attended lectures on chemistry by Dr Matthew Turner of Liverpool and pursued those studies in electricity which gained him the fellowship of the Royal Society in 1766 and supplied him with material for his History of Electricity. In 1762 he had married the daughter of Isaac Wilkinson, a Wrexham ironmaster. In 1767 he was appointed to the charge of Mill Hill Chapel at Leeds, where he again changed his religious opinions from a loose Arianism to definite Socinianism. In his note at the end of his History of Electricity he rationalized the government towards the American colonies. He also began his researches into 'different kinds of airs,' getting a plentiful supply of 'fixed air' from a brewery next door to his house. By the end of 1771 his scientific reputation was such that he was suggested for the post of "astronomer" to Captain Cook's second expedition to the South Seas, but his unorthodox opinions were objectionable to certain members of the board of longitude and the appointment was not ratified. In 1772, the year in which he was chosen a foreign associate of the French Academy of Sciences, he accepted the position of librarian and literary companion to Lord Shelburne (afterwards 1st Marquess of Lansdowne) at Calne, with a salary of £250 a year and a house. With that nobleman he travelled on the Continent; the month of October 1774 he spent in Paris, and meeting Lavoisier and his friends, gave them an account of the experiment by which on the previous 1st of August he had prepared "dephlogisticated air" (oxygen). In 1780 he parted company with his patron, who allowed him an annuity of £150 for life, and settling at Birmingham was appointed junior minister of the New Meeting Society. There he continued his literary and scientific labours, enjoying congenial intercourse with such men as Matthew Boulton, James Keir, James Watt and Erasmus Darwin at the periodical dinners of the Lunar Society. On the 14th of July 1791 the Constitutional Society of Birmingham arranged a dinner to celebrate the anniversary of the fall of the Bastille. Priestley, according to his own account, "had little to do with it." But his predictions in favour of the revolutionists were notorious, and the mob seized the occasion to burn his chapel and sack his house at Fairhill. He and his family escaped, but his material possessions were destroyed and the labour of years annihilated. He retreated to London, where he felt safe, though he continued to be an object of "troublesome attention," and even the fellows of the Royal Society shunned him. But he received an invitation to become morning preacher at Gravel Pit Chapel, Hackney. This he accepted, and performed the duties of the charge till 1794, when he determined to follow his three sons, who had emigrated to America in the previous year. On the 7th of April 1792 he embarked with his wife at Gravesend and reached New York on the 4th of June. Finally settling in Philadelphia, he lived there for nearly ten years, until on the 6th of February 1804, after clearly and audibly dictating a few changes he wished made in some of his writings, he quietly expired.

Priestley was a most voluminous writer, and his works (excluding his scientific writings) as collected and edited by his friend J. T. Rutt in 1817-1832 fill 25 octavo volumes. (The first volume, containing his life and correspondence, was issued separately in two parts, 1817-1823.) His first appearance as an author was in 1761, when he published the Scripture Doctrine of Remission and the Rudiments of English Grammar. His chief theological and philosophical works were Institutes of Natural and Revealed Religion (3 vols., 1773-1774); The History of the Chemical Elements (1774); General History of the Christian Church to the Fall of the Western Empire, vols. i. and ii. (1790), vols. iii. and iv. (1802-1803); Disquisitions relating to Matter and Spirit (1777); and various essays and sermons. All his writings were forgotten, and he is chiefly remembered as a scientific investigator who contributed especially to the chemistry of gases. Yet judged by modern standards he had an inadequate conception of chemical reactions and an incorrect view of the effects of oxygen, and he was forced by experiment to state that oxygen was "...that which is supplied by burning, and which is necessary to all vital action... ...it provides a striking illustration of a remark I have more than once made in my philosophical writings and which can hardly be too often repeated, viz. that more is owing to what we call surprise— that is, philosophically speaking, to the observation of events arising from unknown causes— than to any proper design or preconceived theory in this business. If in this sentence he scarcely does justice to the powers of logical inference and inductive reasoning which display his mind, he is certainly correct in the general truth of what he says. "...while the human mind may be led through blind experiment—heating a substance, or treating it with some reagent, to see what would happen—was his characteristic method of inquiry. Thus by heating spirits of salt he obtained marine acid (hydrochloric acid), and by heating spirits of vitriol he obtained sulphuric acid because he happened to use mercury, instead of water, in his pneumatic trough. Then he treated oil of vitriol in the same way, but got nothing until by accident he dropped some mercury into the liquid, when "vitriolic acid" (sulphur dioxide) was evolved. Again he heated fluor spar with oil of vitriol, as K. W. Scheele had done, and because he was employing a glass vessel he got "fluor acid" (silicon fluoride). Heating spirits of harsomth, he was able to collect "galvanic air" (hydrogen), which he believed was the same as the air breathing man. In a trifling experiment using mercury in his pneumatic trough; then, trying what would happen if he passed electric sparks through the gas, he decomposed it into nitrogen and hydrogen, and "having a notion" that mixed with "...galvanic air... ...the philosopher's breath... ...perhaps much the same as common air, he synthesized sal ammoniac. Dephlogisticated air (oxygen) he prepared in August 1774 by heating red oxide of mercury with a burning-glass, and he found that in a candle burnt with a remarkably vigorous flame and mice lived well. He concluded that it was not common air, but the substance, "in much greater perfection," that rendered common air respirable.
PRIEUR, P.—PRIMAGE

and a supporter of combustion. Of the analogy between combustion and respiration—both true phlogistic processes in his view—he had convinced himself three years before, and his paper, "On Different Kinds of Air" (Phil. Trans., 1772) described experiments which showed that these agents, like oxygen, had been vitiated, whether by being breathed or by having candles burnt in it. Priestley displayed much ingenuity in devising apparatus suited to his requirements and in carrying out and varying his experiments, and in the introduction of results that he was deficient. Had this not been the case he could scarcely have remained a firm believer in the phlogistic doctrine. At one time, indeed, he found Lavoisier's views so specious that he was much inclined to accept them, but he averred, "He had arrived late as 1800 he wrote to the Rev. Theophilus Lindsey (1722–1808), "I have well considered all that my opponents have advanced and feel perfectly confident of the ground I stand upon. . . . Though nearly 90 years of age I approach with no tincture of defeat."

His chief books on chemistry were six volumes of Experiments and Observations on different Kinds of Air, published between 1774 and 1786; Experiments on the Generation of Air from Water (1793); Experiments and Observations relating to the Analysis of Atmospheric Air, and Considerations on the Doctrine of Phlogiston established and that of the Composition of Water refuted (1800). He also published (1767) a treatise on the History and Present State of Electricity, which embodies some original work, and (1772) A History of Discoveries relating to Light, Colors, and which is a mere compilation.

PRIEUR, PIERRE (c. 1626–1676), French enamel painter. He married Marie (1610–1677), sister of Jean Petitot, as her second husband. In 1660 he was in England, painting a miniature of Charles II. and another of Lady Castlemaine, both after Cooper, for the king of Denmark. In 1670 he was in Poland, painting for the Danish monarch a portrait of King Michael, and in the following year was in Denmark executing a remarkable series of portraits of the children of Frederick III. All these, with some beautiful enamel badges for the Order of the Elephant, are in the Danish royal collection. By Christian V. he is said to have been sent to Spain and Russia, where several examples of his work, dated 1676, are to be seen in the Hermitage. In the following year he died in Denmark. He was a Huguenot, and was said to possess secret colours in enamel, especially a blue, which were not known to his Petitot relations. His work in England is of great rarity, Lord Dartrey possessing the finest example, and there are two remarkable works in the Pierpoint Morgan collection and one at Windsor Castle. Two in the Property collection have been lost sight of. (G.C.W.)

PRIEUR DE LA MARNE [PIERRE LOUIS PRIEUR] (1756–1827), French politician, was born at Sommesous (Marne) on the 1st of August 1756. He practised as a lawyer at Châlons-sur-Marne until 1789, when he was elected to the states-general. He became secretary to the Assembly, and the violence of his attacks on the ancien régime won him the nickname of "Crieur de la Marne." In 1791 he became vice-president of the criminal tribunals of Paris. On the 18th Brumaire, 1799, he was sent to Normandy, where he directed bitter reprisals against the Federalists. He voted for the death of Louis XVI., and as a member of the committees of national defence and of public safety he was despatched in October 1793 to Brittany, where he established the Terror. In May 1794 he became president of the Convention. The counter-revolutionaries drove him into hiding from May 1795 until the amnesty proclaimed in the autumn of that year. He took no part in public affairs under the directory, the consolate or the empire, and in 1816 was banished as a regicide. He died in Brussels on the 1st of May 1827.

PRIEUR-DUVENOURS, CLAUDE ANTOINE, COMTE (1703–1832), French politician, was born at Auxonne on the 2nd of December 1763, and was commonly known as Prieur de la Côte d'Or, after his native department. As an officer of engineers he presented to the National Assembly in 1790 a Mémoire on the standardization of weights and measures. In 1791 he was returned by the Côte d'Or to the Legislative Assembly, and in 1792 to the Convention. After the revolution of the 10th of August 1792 he was sent on a mission to the army of the Rhine to announce the deposition of Louis XVI., for whose death he voted in the Convention. In 1793 he was employed in breaking up the Federalist movement in Normandy, but he was arrested by the Federalist authorities of Caen, and only released in July 1793 after the defeat of their forces at Vernon. On the 14th of August 1793 he became a member of the committee of public safety, where he allied himself closely with Lazare Carnot in the organization of national defence, being especially charged with the provision of the munitions of war. Under the Directory he sat in the Council of the Five Hundred, retiring after the coup d'État of 18 Brumaire (November 9, 1799). In 1800 he was created a count of the empire, and in 1811 retired from the army with the grade of chef de brigade. He was one of the founders of the École Polytechnique, and shared in the establishment of the Institute of France; the adoption of the metric system and the foundation of the bureau of longitude were also due to his efforts. Prieur died at Dijon on the 11th of August 1832.

See J. Gros, Le Comité de salut public (1893); and E. Charavay, Correspondance de Carnot, vol. i., which includes some documents drawn up by Prieur.

PRIM, JUAN, MARQUIS DE LOS CASTILLEJOS, COUNT DE REUS (1814–1870), Spanish soldier and statesman, was the son of Lieut.-Colonel Pablo Prim, and was born at Reus in Catalonia on the 12th of December 1814. He entered the free corps known as the volunteers of Isabella II. in 1834, and in the course of the Carlist War he rose to the rank of lieutenant-colonel and had two orders of knighthood conferred upon him. After the pacification of 1839, as a progressist opposed to the dictatorship of Espartero, he was sent into exile. However, in 1843 he was elected deputy for Tarragona, and after defeating Espartero at Bruch he entered Madrid in triumph with Serrano. The regent Maria Christina promoted him major-general, and made him count of Reus. Narvaez, the prime minister, failed to understand what constitutional freedom meant, and Prim, on showing signs of opposition, was sentenced to six years' imprisonment in the Philippine Islands. The sentence was not carried out, and Prim remained an exile in England and France until the amnesty of 1847. He then returned to Spain, and was first employed as captain-general of Porto Rico and afterwards as military representative with the sultan during the Crimean War. In 1854 he was elected to the Cortes, and gave his support to O'Donnell, who promoted him lieutenant-general in 1856. In the war with Morocco he did such good service at Los Castillejos or Marabout, Cabo Negro, Guad al Gelu and Campamento in that he was made marquis de los Castillejos and a grandee of Spain. He was minister of war in the Mexican War, when he refused to consent to the ambitious schemes of Napoleon III. On his return to Spain he joined the opposition, head on pronunciamientos in Catalonia against Narvaez and O'Donnell. All his attempts failed until the death of Narvaez in April 1868, after which Queen Isabella fell more and more under the influence of the Jesuits, and became increasingly tyrannical, until at last Serrano was exiled. In September 1868 Serrano and Prim returned, and Admiral Topete, commanding the fleet, raised the standard of revolt at Cadiz (see SPAIN). In July 1869 Serrano was elected regent, and Prim became president of the council and was made a marshal. On the 16th of November 1870 Amadeo, duke of Aosta, was elected king of Spain, but Prim, on leaving the chamber of the Cortes on the 28th of December, was shot by unknown assassins and died two days later. The Cortes took his children as wards of the country; three days afterwards King Amadeo I. swore in the presence of the corps to observe the new Spanish constitution.

Two biographies of Prim down to 1860 were published in that year by Gimenez y Guittet and Gonzalez Llanos. See also L. Blairet, Le Général Prim et la situation actuelle de l'Espagne (Paris, 1867); Guillaumot, Juan Prim et l'Espagne (Paris, 1870); and Prim, by M. Leonardon (in French, 1901), which contains a useful bibliography.

PRIMAGE (adopted from the Fr. primage, from prime, recompense, Lat. praemium, reward), a commercial term
signifying originally a small customary payment over and above the freight made to the master of the ship for his care and trouble. It is now generally included in the freight, as an additional percentage. It varies according to the usages of different ports and particular trades.

**PRIMATE** (from Low Lat. *primum*=one who held the first place, *primas portae*). During the 4th and 5th centuries A.D. the title was applied to both secular and ecclesiastical officials. The Theodosian Code mentions primates of towns, districts and fortified places (*Primates urbi..., vicorum, castellorum*). The Pragmatic Sanction of Justinian also mentions primates governing a district, *primates regionum*; and in this sense the title survived, under Turkish rule, in Greece until the 19th century. An official called "primate of the palace" is mentioned in the laws of the Visigoths. Primas also seems to have been used loosely during the middle ages for "head" or "chief." Du Cange cites *primas castri*. The title, however, has been more generally used to denote a bishop with special privileges and powers. It was first employed almost synonymously with *metropolitan* to denote the chief bishop of a province having his see in the capital and certain rights of superintendence over the whole province. At the Council of Nicaea (A.D. 325) the metropolitan constituted the highest among which the title of "metropolitan," and "primate," to denote the chief bishop of a province, came into general use. The title of primate was used more generally in Africa, while elsewhere metropolitan was more generally employed. The primates in Africa differed from those elsewhere in that the title always belonged to the longest ordained bishop in a province, who had not necessarily his see in the capital, except in the case of the bishop of Carthage, who was head also of the other five African provinces. There were also three sorts of honorary primates: (1) *primates aevi*, the oldest metropolitan in a province next to the primate, on whom power devolved when the primate was disabled or disqualified; (2) titular metropolitan, the bishops of certain cities which had the name and title of civil metropoles bestowed on them by some emperor; (3) the bishops of some mother-churches which were honoured by ancient custom but were subject to the ordinary metropolitan, e.g. the bishop of Jerusalem, who was subject to his metropolitan at Caesarea.

At a later date "primate" became the official title of certain bishops who obtained from the pope a position of episcopal authority over several other metropolitans and who were, at the same time, appointed vicars of the Holy See. This was done in the case of the bishops of Azles and Thessalonica as early as the 5th century. Such primates were sometimes also called patriarchs, *primates dioecesarum* (political, not episcopal dioceses), *primates provinciae*, *summi primates*, *praesules omnium sacerdotum in partibus suis*. In this sense the Western primate was considered the equivalent of the Eastern patriarch. The archbishop of Reims received the title of *primus inter primas*. By the False Decretals an attempt was made to establish such a primacy as a permanent institution, but the attempt was unsuccessful and the dignity of primate became more or less honorary. The overlapping of the title is illustrated by the case of England, where the archbishop of York still bears the title of primate of England and the archbishop of Canterbury that of primate of all England. A less general use of the title is its application in medieval usage to the head of a cathedral school or college (*primates scholarum*) and to the dignitaries of a cathedral church. The archbishop of Sens received from the pope the title of *primum inter abbatas*. In the Episcopal Church of Scotland the senior bishop is styled the *primas*.

**PRIMATES** (Lat. *primum*, first), the name given by Linnaeus to the highest order of mammals (see MAMMALIA), which was taken by him to include not only man, apes, monkeys and lemurs, but likewise bats. The latter group is now separated as a distinct order (see CHIROPTERA). It has also been proposed to remove from the Primates the lemurs, constituting the group *Prosimiae*, or *Lemuroidea*, to form an order by themselves; but general opinion is now against this view, and they are accordingly here regarded as representing a sub-order of Primates, all the other members of which are included in a second sub-ordinal group—the *Anthropoides*, or *Simiae*. Support to the view that lemurs should be included in the order is afforded by the discovery in Madagascar of an extinct species (*Nesopithecus*) presenting certain characters connecting it with monkeys on the one hand and with lemurs on the other.

In this broader sense the Primates may briefly be defined as follows. All the members of the order are placentate mammals, normally with five fingers and toes, which are generally armed with broad flattened nails, although these are rarely replaced on single digits, or on all the digits, by claws or claw-like nails. The dental formula is $i:4, c:1, p:4, m:3$. All the teeth in advance of the molars being normally preceded by milk-teeth. The molars are three-, four-, or five-cusped, but the cusps may in some cases coalesce into transverse ridges. The thumb and great toe are, as a rule, opposable to the other digits. The clavicles (collar-bones) are complete; there is nearly always a free centrale bone in the wrist, or *hypocentrale*; and the bases of the fingers are unusually widely separated. The orbits (and the eyes) are directed more or less forwards, and generally surrounded by bone (fig. 1), while the lower jaw has a vertical movement on the upper. With a few exceptions the stomach is simple; and a duodenojejunal flexure of the intestine and a cæcum are present. The diet is generally vegetable, but may be mixed, or, rarely, consisting of insects. The uterus may be either bicornuate or simple; and the placenta either discoidal and deciduate, or diffuse and non-deciduate, with the result that development of the allantois. The clitoris may or may not be perforate; the penis is pendent; and the testes are extra-abdominal, situate either in a scrotum behind the penis or in a similarly situated fold of the integument. At most the teats are four in number, but generally only two situated on the breast, although occasionally abdominal or even inguinal. As a rule only a single offspring is produced at a birth, such offspring being always born in a completely helpless condition.

With the exception of man, who has adapted himself to exist in all climates, the Primates are essentially a tropical and sub-tropical group, although some of the monkeys inhabit districts where the winter climate is severe. The great majority—in fact nearly all—of the members of the order are arboreal in their habits. In size there is great variation, the extremes in this respect being represented by man and the gorilla on the one side, and the marmosets and tarsiers, which are no larger than squirrels, on the other.

As regards the proper meaning of the popular names "monkey," "baboon" and "ape," it appears that these are in the main general terms which, with the exception of the second,
may be applied indifferently to all the members of the first sub-order. "Baboon" appears to be properly applicable to the dog-faced African species and may therefore be conveniently restricted to the members of the genus Papiio and their immediate relatives. "Ape," on the other hand, may be specially used for the tailless man-like representatives of the order; while the term "monkey" may be employed for all the rest, other than lemuroids; monkeys being, however, divisible into sub-groups, such as macaques, langurs, guerezas, mangabeys, &c. This usage cannot, however, be universally employed, and the term "monkeys" may be employed for the entire group.

Anthropoidea.—The Primates, as already mentioned, are divisible into two main groups, or sub-orders, of which the first includes man, apes, baboons and monkeys. For this group Professor Max Weber employs the name Simiae (in contradistinction to Prosimiae for the lemuroids), and, however, to take as the title of a group which includes man himself the designation of creatures so much lower in the scale is likely to be reprehensible, it seems preferable to employ the designation Anthropoidea for the higher division of the order.

As in the Anthropoidea and Hylobatidae the second sub-order may best be indicated under the heading of the latter, reference may at once be made to some of the more striking characters of the members of the former group. The proportions of the body regarded as a single unit, the ratio of the lengths of the pairs of limbs to one another and to that of the trunk vary considerably. Both pairs may be much elongated, as in Atelis and Hylobates, and either sub-equal, as in the first of these, or, with the arms greatly elongated, the legs being very short, the hands and the arms, at the same time, excessively long, as in the orang-utan. Both pairs may be short and sub-equal, as in many of the baboons (Papiio). Only in Nyctipithecus and the Hapaleidae does the excess in length of the lower limbs over the upper exceed or equal that which is found in man. The length of the tail presents some noteworthy points. It is found at its greatest absolute length, and also generally developed relatively, being about twice the length of the trunk, in such monkeys as the Indian langurs; but its greatest relative length is attained by the spider-monkeys (Atelis), where it reaches three times the length of the trunk. The constancy of the degree of its development varies much in different groups. In the greater number of genera it is long in all the species, although in some (Simia, Ateles) it is relatively short or even exceedingly small, as in man. In the sub-order it is absent in all. In others it may be long or short, or completely absent, as in macaques (Macacus). The form of the tail presents great differences—it may be rounded, as in Cebus and in the great tailed Guerezas; it may be long and cylindrical, as in Simia; or drawn out posteriorly to an extreme degree, as in Chrysothrix; or anteriorly, as in the baboons. A production of the muzzle, necessitated by the presence of large teeth, exists in the chimpanzees (Anthropopithecus), but in the spider-monkeys (Ateles) while in the sub-nosed monkeys (Rhinopithecus) it is absent in all. In others it may be long or short, or completely absent, as in macaques (Macacus).

The form of the hand presents great differences—it may be rounded, as in the baboons; but they may, on the contrary, attain a relatively enormous size, as in Nyctipithecus. They are always forwardly directed, and never much more separated one from another than in man; they may, however, be more closely approximated, as in the squinting apes (Chrysothrix) of South America.

The ears are always well developed, and very generally have their postero-superior angle pointed. They may be large and small in the same genus, as in Anthropopithecus (chimpanzee and gorilla); but only in the gorilla do they attain, even in a rudimentary condition, that soft dependent portion of the human ear termed the "lobe." The nose has scarcely ever more than a slight prominence, and yet an enormous development is to be met with in the Nasalis-monkey (Nasalis); while in the sub-nosed monkey (Rhinopithecus) we find a sharply prominent, though smaller and extremely upturned nose. The hook-like apertures may be closely approximated, as in all the man-like apes (Simiidae and Hylabatidae), or they may be separated one from the other by a broad septum, as in the Cebidae, its breadth, however, varying in different genera as in Erythrocebus and Callitrichis and Nyctipithecus. The lips are generally thin, but may be very extensile, as in the orang-utan.

The hands are generally provided with thumbs, though these organs in the Cebidae are ill-developed, and the American spider-monkeys, Atelis may be represented only by small nailless tubercles. The thumb is more human in its proportions in the chimpanzees than in any other of the apes. As compared with the primate apes, however, it is larger, and the great separation of the thumb from the index, as in the spider-monkeys, such as Chrysothrix and Hapale. In spite of greater relative length it may, however, little merit the name of thumb, as it is but slightly opposable to the other digits in any of the American monkeys, and is not at all so in the Hapaleidae. The great toe is never rudimentary and, except in man, in place of being the longest digit of the foot, is constantly the shortest. As compared with the entire length of the foot, it is man-like in the chimpanzees and some gibbons, and smallest of all in the orang-utan, and next smallest in Hapale. Every digit is provided with a nail, but in the simias the great toe is generally reduced. This toe, representing the thumb in Atelis and Cobolus. The nail of the great toe is flat in every species, but the other nails are never so flat as are the nails of man. The lateral compression of the nails becomes distinctly marked in some Cebidae, e.g. Erythrocebus. and stands its extreme in the Hapalidae, where every nail, except that of the great toe, assumes the form of a long, curved and sharply pointed claw.

With the single exception of man, the body is almost entirely clothed with copious hair, and never has the back naked. In the gibbons, the langurs, the macaques and the baboons, naked spaces (ischial callosities) are present on that part of the body which is the main support in the sitting posture. These naked spaces are subject to swelling at the season of sexual excitement. Such naked spaces are never found in the American monkeys. No ape or monkey has so exclusive and preponderating a development of hair on the head and face as exists in man. As to the head, long hair is found thereon in Hapale oedipus and in some of the langurs and guerezas, whilst certain macaques, like the Chinese bonnet-monkey (Macacus sinicus), have the hair of the head long and radiating in all directions from a central point on the crown. A beard is developed in the male orang-utan; and the Diana monkey (Cercopithecus diana) has long hair on the cheeks and chin. The appearance of the American Species Patroceus silenus has the face encircled by a kind of mane of long hairs; and many of the marmosets have a long tuft of hairs on each side of the head. American monkeys exhibit some extremes respecting hair-development. Thus in some of the bowlers (as in some of the guerezas of the Old World) the hair of the flanks is dog-like, as in some of the macaques of the Old World. The sacrum and the inner part of the thighs are often entirely hairless; the tip of the tail, moreover, is somewhat long, and even the hairs of the nose, which is naked in man, may be long and silky. This is the case in the case of the great apes, and in Hapale oedipus and Theropithecus gelada. Very long hair is also developed on the back of the sub-nosed monkeys (Rhinopithecus) in winter. The direction of the hair may sometimes vary in nearly allied forms; the hairs on the arm and forearm respectively being often so directed that the tips converge towards the elbow. Such is the case in most of the higher apes, yet in Hylabates agilis all the hair of both segments of the body is industrious towards the back. It may, however, be silky, as in Hapale rosalia, or assume the character of wool, as in the wooly spider-monkeys (Erythrocebus) and Macacus tinmimus, which inhabits Tibet.

Fig. 2.—Skeleton of Chacma Baboon (Papiio pioracous), showing the great relative length of the facial part of the Skull.

Great brilliance of colour is sometimes found in the naked parts of the body, particularly in the baboons and some of the other Cercopithecidae, and especially in those regions of the face and sexual organs. Among these latter rose, turquoise-blue, green, golden-yellow and vermilion appear, in various combinations, in one or other or both of these regions, and become especially brilliant at the period of sexual excitement.

The skeleton, more especially in the higher forms, is in the main similar to that of man, so that only a brief notice is necessary. In the skull considerable variation in regard to the proportionate length of the face to that of the brain-case (cranial portion) exists in the two sexes, owing to the general development of large tusks in the males (other than in man, who is not now under consideration). Generally speaking, the elongation of the facial portion, as compared to the cranial, increases as we pass from the higher to the lower forms. The increase does not, however, occur regularly, being
greater in the orang-utan and chimpanzee than in some of the langurs (Semnopithecus, fig. 1); the maximum development of this feature occurs in the dog-faced baboons (Papio, fig. 2). In American monkeys, with the exception of the howlers (Alouata, fig. 3), the facial part is relatively smaller than in Old World monkeys and apes; while in the squirrel-monkeys (Chrysothrix) it is even smaller than in man himself. In none of the Old World group does the forehead present that rounded and elevated contour characteristic of man, although the height of this region is great in the orang-utan (fig. 4). Curiously enough, American monkeys, especially the species included in Pithecia, are the most man-like in this respect. The skull of the male gorilla is characterized by the great development of the crests for muscular attachment, one of these (superciliary) overhanging the orbit, a second (sagittal) traversing the middle line of the upper surface, while a third (lambdoidal) forms an inverted V on the occiput, and affords attachment for the muscles of the neck.

In the gorilla the orbits are much as in man, but in the orang-utan they are more rounded. They become very large in Hylobates, but attain an enormous size in the American Nycticebus. The extent to which each orbit opens into the adjacent temporal fossa, i.e. the size and shape of the sphenomaxillary fissure, varies considerably; this is narrow and much elongated in the gorilla and the baboons, but short in the langurs and spider-monkeys. It is most closed in the howlers, where it sometimes all but disappears entirely. The mastoid process never attains the large relative size it has in man; but it is prominent in the baboons and larger macaques, as well as in the chimpanzee and gorilla, its development bearing relation to the size and weight of the head. As the mastoid diminishes, the under surface of the petrosal assumes a swollen or bladder-like condition.

The plane of the foramen magnum, as compared with the basi-cranial axis, varies with the projection of the occiput; it generally lies near the level of that axis in man, but in Chrysothrix the angle is yet more open than in the human skull. The cheek, or zygomatic, arches outwards and upwards in the gorilla and some baboons, but decrease in relative as well as absolute size in the smaller forms—notably in Chrysothrix. No long slender styloid process is normally attached to the skull, though such may be the case in the baboons. An external bony auditory meatus (or tube) is present in Old World but absent in New World monkeys. In all apes and monkeys the maxillae have a distinctness of development and a relative size not found in man; the sutures separating them from the maxillae remaining visible, except in the chimpanzee, after the adult dentition has been attained. The maxillae develop great swollen tuberosities in the baboons and the black ape of Cebus. The nasal bones are small, and generally flatter than in man; being in the orang-utan quite flat. They are convex in some langurs and all baboons; but the proboscis-monkey has no more developed than those of other species. The nasals seem an especially large size in the howlers. The lower jaw, or mandible, is always in one piece in adults; and is most man-like in the siamang, which alone has a slight chin. On the other hand, in other gibbons the angle is produced downwards and backwards, as also in marmosets. Its

Fig. 4.—Skull of adult male orang-utan (Simia satyurs).

Fig. 5.—Skeleton of South American Spider-Monkey (Atelis), to illustrate the length of the limbs and tail, and the slenderness of the former.

The number of relative size is attained in the howlers (fig. 3), where the broad ascending part serves to protect and shelter the enormously developed body of the hyoid. Air-cells may be developed, as in the gorilla, in the parts adjacent to the mastoid. Frontal sinuses are generally absent in the Old World group, being replaced by coarse cellular bone. In old age the sutures of the skull become obliterated, the one between the two nasals disappearing at an early age in Old World monkeys. In the spider-monkeys and howlers the tentorium, or membrane dividing the hemispheres of the brain from the cerebellum, becomes bony.

The spinal column of apes and monkeys always lacks the S-like curvature of that of man, the nearest approach to this occurring in the baboons (fig. 2). The number of dorsal vertebrae varies from eleven in some species of Cercopithecus and Macacus to fourteen in certain gibbons or fifteen in the American night-apes (Nycticebus). In the American Cebidae the number seldom falls below thirteen; in the orang-utan it is twelve, as in man, but thirteen in the chimpanzee and gorilla. In most cases the lumbar regions are about equal in length, but the lumbar region is the shorter in the man-like group, and less than half the length of the dorsal in the gorilla. The lumbar spinous processes are vertical, or project backwards in the man-like apes, gibbons and spider-monkeys; in the others they project forwards, especially in Cebidae. The lumbar transverse processes project outwards, more or less at right angles to the axis of the spine, or else forwards. The sacrum attains its greatest absolute length in the gorilla, but is relatively longer than in man in the man-like group. Hylobates has the relatively longest sacrum. The number of vertebrae included in the sacrum varies more or less with age; with the exception of the Simiidae and Hyllobatidae, there are generally only two or three; but in Atelis, Hylobates, and Ururopsis the number may be four; while in the Simiidae there are always five, and sometimes six. In most apes the sacrum and lumbar vertebrae lie in one slightly curved line, the gorilla and chimpanzee presenting in this respect a great contrast to the human structure. In the orang-utan the sacro-vertebral angle is rather more marked; but in some baboons it is so much so as almost to rival that of man.
With the exception of the man-like apes and gibbons and the Barbary ape (Macacus inuus), the caudal vertebrae of monkeys exceed four in number; but the mandril, Papio (Maimon) maimon, has sometimes only five. The short-tailed macaques and uakaris have from about fifteen to seventeen vertebrae in the tail, which is thus often proportionately the foremost. If the vertebrae are only being occasioned rather by a diminution in the size of the component vertebrae than by a decrease in number. In the other forms the number varies between twenty and thirty-three, the latter being the number attained in the spider-monkeys of the genus Ateles. In any case the number of vertebrae in the human male is usually between thirty and thirty-four; in the female, however, there are sometimes nine or ten more vertebrae than in the male. In the man-like apes the tail is less in length, and the number of vertebrae is accordingly greater. The same is true of the spider-monkeys of the genus Ateles, almost three to one; in the other long-tailed genera it is rarely so large as two to one. The length of the tail is greatest in the langurs and monkeys, where also the individual caudal vertebrae may attain their greatest length, namely two inches. The caudal vertebrae generally increase in length from the sacrum till about the seventh, eighth or ninth, which, with the tenth and eleventh, are the longest; and, in the long-tailed forms, in Ateles, the eleventh, twelfth, thirteenth and fourteenth vertebrae are the longest. In most members of the sub-order the breast-bone, or sternum, is narrow, and consists of a more or less elongated upper portion, or manubrium, followed by a chain of sub-equal elongated bones from three to six in number. In man, man-like apes and gibbons there is, however, a broad sternum; or one consisting of a manubrium, followed by one bone only, as in Hylabates. In the orang-utan and spider-monkeys the manubrium makes no use of ossifications arranged in pairs, side by side, successively. The true ribs are seven in number on each side in the highest forms, but in Hylabates there are sometimes eight; in Ateles there are sometimes nine. The manubrium number varies from six to eight, and from seven to eight in the other long-tailed monkeys. The "angles" of the ribs are never so marked as in man; most so in Hylabates. Pithacia is distinguished by the greater relative breadth of the ribs. In no ape or monkey is the thorax as broad again as it is deep from back to breast. Nevertheless, in the Simiidae and Hyloditidae, its transverse diameter exceeds its depth by from about one to-fourth to a little under one-third of the latter. In Ateles, however, the thorax is wider than deep, but in the rest it is deeper than wide.

The greatest absolute length of the fore-limb occurs in the gorilla (fig. 6) and the orang-utan. The human never has a perforation (entepicondylar) on the inner side of the false condyle. The metacarpus of the man-like apes, the ulna articulates with the wrist (carpus). The hand is capable of pronation and supination of the fifth metacarpal. Good examples are the great apes, except in man, the chimpanzee, and gorilla there is a central a in the carpus. The phalanges are the same in the primate apes and monkeys as in man, except that in Ateles and Colobus, the thumb may have a small nodular phalangeal or nodose phalangeal articulation, which degree of curvature is more curved than in man, and, except in the Hapalidae, the terminal ones are flattened from back to front, and are therefore always more or less flattened. The thumbs, thus estimated, is found in Nycticebus and Chrysothrix. The length, measured from the summit of the femur to the tip of the longest digit, is absolutely greatest in the gorilla, and their in the human, which is more or less the same in the hand and foot. If the foot be removed, the leg of the chimpanzee is longer than that of the orang-utan. The ankle, or subtalar, joint is more open in the monkey than in man, and these bones are so arranged, or bound together by ligaments, as to form a transverse ridge. If the sub-tarsal is removed, the bone is seen to be a ridge. In no ape or monkey, however, do the lower ends of the inner metatarsals form the anterior point of support of the antero-posterior arch, as in man. The calcaneum, except in the gorilla, is shorter compared with the spine than in man. The phalanges of the foot are the same in number as in man, except that the great toe of the orang-utan has often but one. They are very like their representatives in the hand, and are convex above, concave and flattened below. Only in the Hapalidae are the terminal phalanges laterally compressed instead of flattened. The toes are never nearly so short relatively in apes and monkeys as in man; yet the proportion borne by the great toe, with its metatarsal, to the spine closely approaches that of the human. The pelvis is divided into the greater and the lesser pelvis, the former of which is much less in width than the latter and is correspondingly narrower. Only in the orang-utan and chimpanzee is it but 26 and 27 cub, in, respectively. The greater size of the brain varies inversely with the size of the whole body, as is the case in the Primates. The greatest diminution of brain size that exceeds almost always so much developed as to cover over the cerebellum, the only exceptions being the howlers and the siamang (Hylobates syndactylus). In the latter the cerebellum is slightly enlarged. In the siamang it is used in its front limb movement. In the latter the posterior lobes are more largely developed relatively than in man. As in mammals generally, much convoluted hemispheres are correlated with a considerable absolute bulk of body. Thus in Hylabates and here only we find the hemisphere's smoothness, the only groove being that which represents the Sylvian fissure. In Simia and Anthropopithecus, on the contrary, they are richly convoluted. A hippocampus minor is present in all apes and monkeys larger relatively than in man, and absolutely larger than the hippocampus major. Of lesser apes and monkeys the orang-utan has a brain most like that of man; indeed it may be said to be like man's in all respects save that it is much larger, longer, and heavier, and that the hemispheres are more symmetrically convoluted. The cerebral folds of the Hapalidae and Sudani brains, Professor G. Elliot Smith finds, however, that this simian fold, or sulcus, can be distinctly recognized. It is one of the several examples from the series of Egyptian brains in my possession, in which the pattern formed by the occipital sulci on the lateral surface of the hemisphere in individual anthropoid apes is so exactly reproduced that the identity of every sulcus is placed beyond reasonable doubt. And if we take the former examples of other convolutions discovered by Smith more easily to match the occipital pattern of some of them to numerous human brains. It is easy to appreciate the difficulties which have beset investigators of European types of brain, and to understand how the occurrence of the supposed distinctly simian sulci in the lateral aspect of the occipital region of the human brain.

In no ape or monkey does the series of teeth form so perfect a circle as in man. In the opposite series of cheek-teeth tending to become more parallel. None has the teeth placed in one uninterrupted series in each jaw, as is the case in the human species; but there is always a small gap between the upper canine and the adjacent molar, and between the lower canine and the first molar. This condition is due to the excessive size of the canines, the interspaces giving passage to the tips of these teeth. This prolongation of the canines into tusk-like weapons of offence and defence (especially developed in the mandrill and elephant) gives the most characteristic aspect of the dentition in apes and man. The number of the teeth is the same as in man in all Old World Primates. The New World Cebidae have an additional premolar on each side of each jaw, while to the left of the upper jaw, the lower incisors are equal in length. The premolar differs structurally from the molars much and much enlarged as compared with the others. Thus in Cercopithecus talapoin it has but three teeth, while in the macaques and baboons it is very large, and has five well-developed cusps. The number of molars in the man-like apes varies, but in the other monkeys, there are generally three, or more, or one, or, however, a complete series of teeth, except langurs,
PRIMATES

Man-like Apes.—In common with man, the apes and monkeys of the Old World form a section—Catarrhina—of the sub-order Anthropoidea, characterized by the following features: There are only two pairs of premolar teeth, so that the complete dental formula is \( 3, 1, 3, 3 \); \( 1, 0, 3, 3 \). The symphysis has an external bony tube, or meatus; but there is no tympanic bulla. A squamoso-frontal suture causes the frontal and the alisphenoid bones to enter largely into the formation of the orbital plate; and the orbito-temporal foramina is small. Cheek-pouches and callousities on the buttocks are frequently present. The nails are flat or rounded, the descending colon of the intestine has an S-like (sigmoid) flexure;

guerezas, and their allies. It is especially human in shape in \( H. \) *hylobates* except that the pyriform is somewhat more elongated and distinct. It is of a rounded form in *Pithecia*, and in *H. palae* the cardiac orifice is exceptionally near the pyriform. In the langur group it is sacculated, especially at the cardiac end, being, in fact, very like a colon spirally coiled. The intestine is devoid of \( V. \) *volvulae commentantes*, but provided with a well-developed caecum, which is, however, short and conical in the baboons. Only in the man-like apes is there a vermiliform appendix. The colon may be much longer relatively than in man, as in the man-like apes; it may be greatly sacculated, as in *H. hylobates*; or devoid of sacculations, as in *Cebus*. The liver may be very like man's, especially in gibbons, the orang-utan, and the chimpanzee; but in the gorilla both the right and left lobes are cleft by a fissure almost as much as in the baboons. In the langur group the liver is much divided, and placed obliquely to accommodate the sacculated stomach. The lateral lobes in *Hypale* are much larger than the central lobe. The caecum is very large in *Cebidae*, especially in *Atelles*, and above all in *Pithecia*. There is always a gall-bladder.

The larynx in many members of the sub-order is furnished with sac-like appendages, varying in different species as regards number, size and situation. There may be dilatations of the laryngeal ventricle (opening into the larynx below the false vocal chords), as in the man-like apes; or they may open above the false vocal chords so as to be extensions of the thyro-hyoid membrane, as in gibbons. There may be but a single median opening in the front part of that membrane at the base of the epiglottis, as in *Cercopithecidae*, or there may be a single median opening at the back of the trachea, just below the cricoid cartilage, as in spider-monkeys; and while there is in some instances only a single sac, in other instances, as in the howlers, there may be five. These may be enormous, meeting in the middle line in front, and extending down to the axillae, as in the gorilla and orang-utan. Finally a sac may occupy the cavity of the expanded body of the hyoid bone, as in howlers (fig. 3). The hyoid has its basilar part generally somewhat more convex and enlarged than in man; but in howlers it becomes greatly enlarged and deeply excavated, so as to form a great bony dental-like structure (fig. 3). The cornua of the hyoid are never entirely absent, but the anterior or lesser cornua may be so, as in the howlers. The anterior cornua never exceed the posterior cornua in length; but they may be *Cercopithecus* more developed relatively than in man, and may even be joined, as in *Lagidiae*. The lungs are generally similar to those of man, although, as in gibbons, the right one may be four-lobed. In the man-like apes the great arteries are likewise of the human type; but in the *Hylobatidae* and *Cercopithecidae* the left carotid may arise from the innominate. The dicoical and deciduate placenta is generally two-lobed, although single in the howlers; in the marmosets it is unusually thick. American monkeys differ from their Old World

![FIG. 8.—Adult Male Gorilla (Anthropopithecus gorilla).](image)

the caecum is simple, and there may be a vermiform appendix. The inter-nasal septum is thin, and the nostrils are directed outwards. The tail, which may be rudimentary, is never prehensile. The ethmoturbinal bones of the nasal chamber are typically united. Laryngeal sacs are commonly developed. In addition to the primary dicoical placenta, a secondary, and sometimes temporary one is developed.

It does not come within the province of this article to treat of man (see *Anthropology*); but it may be mentioned that the distinctive characteristics of the family *Hominidae* (including the single genus *Homo*), as compared with those of the *Simidae*, or man-like apes, are chiefly relative. These are shown by the greater size of the brain and brain-case as compared with the facies portion of the skull, smaller development of the canine teeth of the males, more complete adaptation of the structure of the vertebral column to the vertical position, greater length of the lower as compared with the upper extremities, and the greater length of the great toe, with almost complete absence of the power of bringing it in opposition to the other four toes. The last and the small size of the canine teeth are perhaps the most marked and easily defined distinctions that can be drawn between the two groups, so far as purely zoological characters are concerned. The regular arch formed by the series of teeth is, however, as already mentioned, another feature distinguishing man from the man-like apes.

In common with the gibbons (*Hylobatidae*) the man-like apes, or *Simidae*, are distinguished from the lower representatives of the present sub-order by the following features: The sternum is short and broad, and the thorax wide and shallow (fig. 6), while the pelvis, as shown in the same figure, is more or less vertically expanded, and hollow on its inner-surface; and the number of dorso-lumbar vertebral ranges from sixteen to eighteen. The arm is longer than the leg; and while the hair on the fore-arm is directed upwards, that of the upper-arm is directed downwards. The apposition of only the edge of the sole of the foot to the ground in walking.

(From a sketch by Wolf from life.)

**FIG. 7.**—An Immature Chimpanzee (*Anthropopithecus troglodytes*). cousins in having two umbilical veins in place of a single one. In the *Cercopithecidae* gestation lasts about seven months, but in the marmosets is reduced to that of the young, which are generally carried on the breast, are suckled for about six months in most monkeys.
PRIMATES
The existing members of the family are referable to at least
two genera, the one African and the other Asiatic. The first genus,
Anthropopithecus, 1 is typified by the West African chimpanzee,
A. troglodytes (fig. 7), and is characterized by the absence of excessive
elevation in the skull, by the fore limb not reaching more than
half-way down the shin, the presence of thirteen pairs of ribs, the
well-developed great toe, the absence of a centrale in the carpus, and
the black or grey hair. There is a well-developed laryngeal sinus,
which may extend downwards to the axilla. Chimpanzees are
characterized by the large size of the ears, and typically by the
small development of the supra-orbital ridges.
The latter are,
however, more developed in the Central African A. tchego (of which
the kulu-kamba is a local phase) this form whether regarded as
a species or a race being thus more gorilla-like (see Chimpanzee).
The gorilla {Anthropopithecus gorilla, fig. 8), of which there are
likewise several local forms, ranging from the West Coast through
the forest -tract to East Central Africa, and apparently best regarded
as sub-species, is frequently made the type of a second genus
Gorilla; but is extremely close to the chimpanzee, from which it
is perhaps best distinguished by its much smaller ears.
It is the
largest of the apes, although the females are greatly inferior in
stature and bulk to the males.
The gorilla is also a much less
completely arboreal ape than the chimpanzee, in consequence of
which more of the sole of the foot is applied to the ground in walking.
The enormous supra-orbital ridges of the skull of the male, and likewise the large and powerful tucks in that sex are very characteristic.
A full-grown gorilla will stand considerably over six feet in height.
According to Dr A. Keith, in addition to its smaller and flatter
ears, the gorilla may be best distinguished from the chimpanzee by
the presence of a nasal fold running to the margin of the upper lip
by the large size and peculiar characters of the tusks and cheekteeth; by its broad, short, thick hands and feet, of which the fingers
and toes are partially webbed by the long heel and by the relative
length of the upper half of the arm as compared with the fore-arm.
An important distinctive feature of the skull of the gorilla is the great
length of the nasal bones. Finally, in adult life the gorilla is sharply
differentiated from the chimpanzee by its sullen, untameable,

—

;

—

—

;

;

ferocious disposition.

As regards the relationship existing between the gorilla and the
chimpanzee, Dr Keith observes: "An examination of all the
structural systems of the African anthropoids leads to the inference
that the gorilla is the more primitive of the two forms, and approaches the common parent stock more nearly than does the
chimpanzee. The teeth of the gorilla, individually and collectively,
form a complete dentition, a dentition at the very highest point
of development; the teeth of the chimpanzee show marked signs
The
of retrogression in development both in size and structure.
muscular development and the consequent bony crests for muscular
attachment of the gorilla far surpass those of the chimpanzee.
The muscular development of the adult chimpanzee represents
that of the adolescent gorilla. Some of the bodily organs of the
gorilla belong to a simpler and earlier type than those of the
chimpanzee. But in one point the chimpanzee evidently represents
more nearly the parent form its limbs and body are more adapted
for arboreal locomotion; of the two, the gorilla shows the nearer
approach to the human mode of locomotion. On the whole the
evidence at our disposal points to the conclusion that the chimpanzee
is a derivative from the gorilla stock, in which, with a progressive
brain development, there have been retrograde changes in most of
The various races of chimpanzee
the other parts of the body.
differ according to the degree to which these changes have been
carried."
(See Gorilla.)
From both the chimpanzee and the gorilla the orang-utan, or
mias (Simia satyrus), of Borneo and Sumatra is broadly distinguished
by the extreme elevation of the skull (fig. 4), the excessive length of
the fore limbs, which reach to the ankle, the presence of only twelve
pairs of ribs and of a centrale in the carpus, the short and rudimentary great toe, and the bright-red colour of the hair. Adult
males are furnished with a longish beard on the chin, and they
may also develop a large warty prominence, consisting of fibrocellular tissue, on each side of the face, which thus assumes an extraordinary wide and flattened form. There is no vestige of a tail.
The hands are very long; but the thumb is short, not reaching the
end of the metacarpal bone of the index-finger. The feet have
exceedingly long toes, except the great toe, which only reaches to
the middle of the first joint of the adjacent toe, and is often destitute
not only of a nail, but of the second phalange also. It nevertheless
The brain has the hemispheres
possesses an opponens muscle.
greatly convoluted, and is altogether more like the brain of man
than is that of any other ape. A prolongation is developed from
each ventricle of the larynx, and these processes in the adult become
enormous, uniting together in front over the windpipe and forming
one great sac which extends down between the muscles to the axilla.
The canine teeth of adult males are very large. In Borneo the
orang-utan displays great variability, and has accordingly been
divided into a number of local races, in some of which the males

—

329

apparently lack the lateral expansion of the face.

Sumatran orang-utan should be regarded as a
two local races, may be left an open question.

—The

Gibbons.
Asiatic apes

comparatively small, long-armed and tailless
as gibbons have been very generally included

known

in the same family as the man-like apes; but since they differ
in several important features
to say nothing of. their smaller
bodily size it has recently been proposed to refer them to a family
apart, the Hylobatidae.
The distinctive features of this family
include the presence of small naked callosities on the buttocks,
the possession of eighteen dorso-lumbar vertebrae and thirteen
pairs of ribs, the absence of foldings in the enamel of the molar
teeth, the. slight lateral expansion and concavity of the iliac bones
of the pelvis, and the application of the whole sole of the foot to
the ground in walking. The vertebral column presents no trace of
the sigmoid flexure which is developed partially in the Simiidae
and completely in the Hominidae. None of the gibbons have any
rudiment of a tail; and the canines are elongated and tusk-like.
When the body is erect, the arms are so long that they reach the

—

—

The great toe is well developed, reaching to the middle
or end of the first joint of the adjacent toe; but the thumb only
attains to, or reaches a little beyond, the upper end of the first
There is a centrale in the carpus. The
joint of the index-finger.
laryngeal sacs are no longer prolongations of the laryngeal ventricles, but open into the larynx above the false vocal chords. The
group is distributed throughout the forest-regions of south-eastern
Asia, eastwards and southwards from Assam, and is represented
by a considerable number of species. Among these, the siamang,
Hylobates syndactylus, of Sumatra and the Malay Peninsula, differs
from all the rest by the union of the index and third fingers up to
the base of their terminal joints, in consequence of which this
species is regarded as representing a sub-genus (Symphalangus) by
itself, while all the others belong to Hylobates proper.
The general
colour of gibbons is either pale fawn or black, with or without a
white band across the forehead. In a female from Hainan in the
menagerie of the Zoological Society of London, the colour of the
coat changed from black to fawn about the time full maturity was
attained.
Apparently no such change takes place in the male.
According to Dr W. Volz, the two banks of the Lematang River in
the Palembang district of Sumatra are respectively inhabited
by two different species of gibbons on the west bank is found the
siamang (Hylobates syndactylus), while the country to the east
of the river is the home of the agile gibbon, or waw-waw (H. agilis).
It is not necessary to capture, or even to see, specimens of the two
species in order to satisfy oneself as to their limitations, for they
may be readily distinguished by their cries: the siamang calling
in a single note, whereas the cry of the waw-waw forms two notes.
The remarkable thing about their distribution in Palembang is
that the two species are found in company throughout the rest of
Sumatra; and even in Palembang itself they inhabit the mountain
districts, where the river is so narrow that they could easily leap
over it, and yet they keep to the opposite banks. Gibbons are
perhaps the most agile of all the Old World monkeys, rivalling in
this respect the American spider-monkeys, despite their lack of
the prehensile tails of the latter (see Gibbon).
Langur Group. The well-known long-tailed langur monkeys of
India and the adjacent regions are the first representatives of the
third family of apes and monkeys, which includes all the remaining
members of the sub-order now under consideration. In the Cercopithecidae, as the family is called, the following features are distinctive:
The sternum, or breast-bone, is narrow and elongated, ana the
thorax compressed and wedge-shaped, while the iliac bones of the
pelvis are narrow, with the inner surface flat; the dorso-lumbar
vertebrae are nineteen or twenty in number. The front limbs are
shorter than the hind pair; the whole sole of the foot is applied to
the ground in walking and the hair on the arm is directed downwards from the shoulder to the hand. There are always bare
callosities on the buttocks, and very generally cheek-pouches.
The caecum is conical. Transverse ridges connect the cusps of
the molars. The secondary placenta is fully developed.
The first group of the family is represented by the langurs and
their allies, collectively forming the sub-family Semnopithecinae,
in which the tail and hind limbs are very long, and the body is
slender; there are no cheek-pouches, but, on the other hand, the
stomach is complicated by sacculations or pouches, and the last
lower molar has a posterior heel, thus carrying five cusps. The
thumb is small or absent, the callosities on the buttocks are also
small, and the nails are narrow and pointed.
The laryngeal sac
(or throat-sac) opens in the middle line of the front of the larynx,
and is formed by an extension of the thyro-hyoid membrane. Tne
true langurs, of the genus Semnopitheciis, in which a small thumb
is retained, form a large group confined to south-eastern Asia, where
it ranges from India and the Himalaya to
Borneo and Sumatra
by way of Burma, Cochin China and the Malay Peninsula. A
well-known representative is the sacred hanuman monkey (5.
entellus) of India, which, like the larger Himalayan S. schistaceus,
is slate-coloured the Bornean 5. hosei, on the other hand, is wholly
maroon-red. Other species, like the Indian S. johni, have the head
crested. The allied genus Rhinopithecus, as typified by the orange
ground.

PRIMATES

snub-nosed monkey, *R. roxellanae* (fig. 9), of eastern Tibet and Szechuen, is characterized by the curiously short and upturned nose and the long silky hair of the back, especially in the winter coat. In the typical species the predominating colour is orange, tending to yellowish-olive on the back; but in *R. bieti* of the mountains bordering the valley of the Mekon and *R. brelichi* of Central Asia it is slaty-grey. The third Asiatian genus is represented by the proboscis monkey (*Nasalis larvatus*) of Borneo, in which the nose is extraordinarily elongated. The nose of the adult male is commonly being the lesser white-nosed guenon (*C. ptilura*) of West Africa and the hoocher, *C. nictitans*, which is also West African. In the typical group, as represented by the malborough monkey (*C. cynocephalus*) of the West Coast, and the Abyssinian grivet (*C. sabaeus*), the fur of the back is of a more or less olive-green hue, while the under surface and whiskers are white and the limbs grey. The large patas monkey (*C. patas*) of West Africa and the red-backed monkey (*C. pyrrhonotus*) of Kordofan typify a third section (*Erythrocebus*), characterized by the red upper and white lower surface of the body. A fourth section (*Mona*) includes the mona (*C. mona*) of Western, and Sykes’s monkey (*C. albogularis*) of Eastern Africa, with a number of allied species, characterized by the presence of a black hand running from the outer angle of the eye to the ear, and the black or dark-grey limbs. The bearded monkey (*C. pogonias*) of Fernando Po and Guinea, with two sub-species, typifies a small section (*Lophocebus*), characterized by large rufous or yellowish underparts. The last section is represented by *Erythrocebus*, which includes the very short-furred *E. tibetanus*.

The long-tailed macaque (*Macaca fascicularis*) of the Indian sub-continent also represents this section, but the latter may want it.

From Milne-Edwards.

FIG. 9.—The Orange Snub-nosed Monkey (*Rhinopithecus roxellanae*), represented as projecting straight out from the face, but it really bends down to overhang the upper lip; it is much shorter in the female, and quite small and slender upwards in the young. (See Langur and Proboscis Monkey.)

The African guerezas, forming the genus *Colobus*, differ from their Asiatic cousins by the total loss of the thumb. Some of these monkeys, like *Colobus satanas* of West Africa, are wholly black; but in others, such as *C. guereza* (or *abysinicus*), *C. sharpei* and *C. caudatus* of North-east and East Africa, forming the sub-genus *Gueraza*, there is much long white hair, which in the species last-named forms a mantle on the sides of the body and an elongated fringe to the tail, thus assimilating the appearance of the animal to the long lichens hanging from the boughs of the trees in which it dwells. Most or all of the *Semnopithecinae* feed on leaves; a circumstance doubtless correlated with the complex structure of their stomach.

Cercopithecus, Mangabeys, Macaques and Baboons.—The whole of the remaining members of the family *Cercopithecidae* are included in the sub-family *Cercopithecinae*, which presents the following characteristics: The hind limbs are not longer than the front pair; the tail may be either long, short or practically absent; cheek-pouches are present; the stomach is simple; the callosities on the buttocks are often very large; the last lower molar may or may not have a posterior heel; the thumb is well developed. All the *Semnopithecinae* are arboreal, many of the *Cercopithecinae* and, more especially the baboons, are to a great extent or entirely terrestrial. The typical representatives of the group are the African monkeys, forming the genus *Cercopithecus*, which includes a very large number of species with the following characters in common; the tail, although shorter than in the *Semnopithecinae*, is long, as are the hind limbs, while the general form is slender. The lower incisors are of moderate size; and the hairs of the thick and soft fur are in most cases marked by differently-coloured rings. For convenience of description the numerous species of this genus may be arranged in a number of groups or sub-genera. The first of these groups includes the spot-nosed forms (*Rhinosciurus*), characterized by the presence of a spot of white, red or blue on the nose; well-known species,

*From Milne-Edwards.*

FIG. 10.—The Tibet Macaque (*Macaca arctoides tibetanus*), equal to half the length of the body or less; but in the Barbary tar-dar (*C. babar*) and the presence of three black stripes on the back, the upper arm, the outer side of the tail, and the lower lip, which is hanging, the number is wanting. In a third group (*Nemestrinae*), represented by the pig-tailed macaque (*M. nemestrinus*), ranging from Burma to Borneo, and the lion-macaque (*M. leonina*), both of *Malayan* origin, the tail, general the eyelids lack bare flesh-covered ring. The lion-tailed macaque (*M. silenus*) of southern India, often cast the wader, represents a group by itself (*Vetulus*) characterized by...
The long hair fringing the face and meeting under the chin, and the tufted lion-like tail, which is from one-half to three-quarters the length of the body. The last group (Cynomolgus), now often regarded as a distinct genus, is typified by the widely-spread crab-eating macaque (Macaca fascicularis), characterized by tufted muzzles, short and stout limbs, and basally-swollen tail, which is nearly as long as the body. It also includes the South Indian bonnet-macaque (M. speciosa) and the Ceylon toque-macaque (M. petaurus), taking their names from the elongated hair on the crown, which are nearly allied, and with the first-named species approach the baboons in their elongated muzzles (see Macaque).

A still nearer approach to the baboons is made by the black ape (Cynopithecus niger) of Celebes and the neighbouring islands, which is represented by several sub-species, among them the so-called

**Moore-macaque (Macacus maurus).** Some difference of opinion exists as to the proper serial position of this species, which is included in Macacus by several zoologists who separate Cynomolgus as a genus. It is characterized by the marked elongation of the muzzle, which, like the neck, hands and feet, is naked. Its nostrils are, however, directed outwards and downwards, as in the macaques; but, on the other hand, the baboons have baboon-like ridges on the sides of the muzzle and heavy supra-orbital ridges. There are large cheek-pouches; and the tail is a mere stump. The colour is sooty-black. The weird-looking gelada baboon (Theropithecus gelada) of South Africa, and the allied T. obscure of eastern Abyssinia, represent a genus which is essentially baboon-like in general characteristics, but has the nostrils of the macaque-type, while the facial portion of the skull is shorter than the cranial. The preorbital portion of the face is concave with the ridges rounded, and the tusks are very long. The long tail is tufted at the tip, and the hair is long and bushy, developing into a mane-like mantle on the forehead of old males, leaving the chest bare. The general colour is dark-brown. The last representatives of the Cercocebisidae are the baboons, or dog-faced baboons, of Africa and Arabia, forming the genus *Papio*. These are for the most part large monkeys, associating in herds under the leadership of an old male, and dwelling chiefly among rocks, although they ascend trees in search of gum. There are recognized by their long dog-like faces (fig. 11), in which the nostrils point upwards, the extremity of the greatly elongated muzzle. On the sides of the muzzle are prominent longitudinal ridges covered with bare skin which may be brilliantly coloured. The callousness, which are also generally bright-coloured, are large; and the tail is of moderate length or short. The hairs are ringed with different colours, and the general colour is olive, yellow, grey or brownish. The typical, and at the same time the smallest representative of the group is the yellow baboon (P. cynocephalus or P. babun) (fig. 11), ranging from Abyssinia to Angola and Mozambique, and distinguished by its rather large grooved muzzle and long tail, which is nearly as long as the body. The majority of the species, such as the widely spread *P. anubis* (with several local races), P. sphinx of East Africa, and the chacma (P. parvus) of South Africa, are included in the sub-genus *Cercocebis*, and have the muzzle longer and undivided and the tail divided, so that the colour is golden-orange with grey distinct rings, but in the chacma it is darker. The hamadryad baboon, P. hamadryas, of north-east Africa and Arabia, and the closely allied *P. arctinus* of southern Arabia, represent a sub-genus *Hamadryas* characterized by the ash-grey colour and the profuse mantle-like mane of the adult males; the ridges of the nostrils and cheeks are black, and the callousness on the buttocks are of equal brilliance; but in the drill, which has white ear-tufts, the colouring is more sombre (see Baboon and Mandrill).

**American Monkeys and Marmosets.**—The monkeys and marmosets of tropical America constitute the Platyrhina, or second section of the Anthropoidea, and are characterized as follows: An additional premolar is present in both jaws, bringing up the number of these teeth to three pairs. The tympanum is ring-like, with no external bony-tube, or meatus; and a tympanically cingulum exists. A parieto-zygomatic suture causes the jugal bone to be included in the orbital plate; and the orbito-temporal foramen is large. Cheek-pouches and callosities on the buttocks are wanting. The descending colon does not form a sigmoid flexure, and the caecum is generally bent in a hook-like form, with, at most, very slight narrowing of its terminal extremity. The cartilage forming the inter-nasal septum is broad, and the nostrils are directed obliquely forwards. The tail, which never has fewer than fourteen vertebrae, is generally as long as the body, and frequently prehensile. The ethmoturbinals are generally separate; and the laryngeal sac, when present, is of peculiar type. Usually there is only a simple primary discoid placenta, but rudiments of a secondary one have been recently described.

The first family, or Cebidae, includes the American monkeys, as distinct from marmosets, which present the following characteristics: The ears are more or less naked externally. The terminal joints of the fingers and toes carry flat or curved nails; and the thumb, when present, is opposable to the other fingers. Except in the uakaris, the tail is long, generally short-haired, and frequently with a terminal bare surface for prehension. Dentition i, c, p, f, m. Generally a foramen (entepicondylar) in the side of the lower end of the humerus. As a rule, only a single offspring is produced at a birth. Ranging over tropical America, Cebidae have their headquarters in the vast Brazilian forests, where some of the animals are more or less arboreal in their habits. These monkeys are completely arborial, more so, indeed, than the gibbons among the Catarrhina.

The first sub-family, Alouatinae, is represented only by the howlers *Alouatta* (or *Mysetes*), characterized by the long prehensile tail with the extremity naked below, the well-developed thumb, and the extension of the hyoid-bone into an enormous bladder-like organ contained between the two branches of the lower jaw (fig. 3). In this bony cup is found one of the three or five laryngeal sacs. There are about half a dozen species, with several sub-species; three of the best known being *A. seniculus, A. belzebul* and *A. urina*. Several are brilliantly coloured, with bright or golden hair on the flanks; but in the Amazonian *A. nigra* the male is black and the female is grey-coloured. The muzzle is longer than in other Cebidae (see Howler).

**Fig. 11.—The Yellow Baboon (Papio cynocephalus).**

**Fig. 12.—The White-checked Capuchin (Cebus lunatus).**

The Cebinae include the typical members of the family, characterized by the large brain, of which the elongated hemispheres constitute the cerebellum; the brain-case of the skull being, of course, elongated in proportion. The lumbar vertebrae are short, with upright comb-like processes, instead of the rhomboidal ones of the howlers. The lower jaw and hyoid are of normal form. In the first section of the sub-family the tail is evenly haired throughout, the thumb
well developed, the limbs of medium length, with the front not longer than the hind pair, the nails curved, and the humerus with an entepicondylar foramen. The typical genus Cebus includes the numerous species of capuchins, many of which are so commonly seen in captivity. They are stout in build and smaller in size than the spider-monkeys, and their tails are only prehensile to a small extent, but are commonly carried spirally rolled. The conical upper canines project below the upper lip, and the molars have blunt low cusps. Well-known species are the white-checked capuchin, C. lupatus (fig. 12), of south Brazil; the true capuchin, C. capucinus, ranging from Guiana to Brazil; and the brown capuchin, C. fuscus, of Guiana; all of these showing the black crown from which these monkeys take their popular name. The most northern representative of the group is the white-throated C. hypoleucus, which ranges to Costa Rica. The squirrel-monkeys, Chrysothrix (or Saimiris), of which C. sciuereus is the most familiar representative, and the Cebus, Chiaslostoma, and the spider-monkeys, (Lagotrichus), although their true position seems to be here. They differ from Cebus by their smaller size and more delicate build, by the tail being scarcely at all prehensile, by the smaller canines, smaller and narrower orbits, and better developed external auditory meatus, whose inner walls are partly membranous (see Capu-
chin and Squirrel-Monkey).

The second section of the sub-family includes the spider-monkeys (fig. 13), and is characterized by the completely prehensile tail,

![Fig. 13.—Geoffroy's Spider-Monkey (Ateles geoffroyi).](image)

with the inner surface of the tip naked, the rudimentary condition or absence of the thumb, the laterally compressed and more or less pointed nails, and the absence of an entepicondylar foramen to the humerus. The limbs, too, are very long and slender, with the front pair of greater length than the hind ones. The caecum approximates to that of the Catarrhina, having its terminal extremity pointed. The true spider-monkeys (Ateles) lack the thumb, and have the nails with rounded points, long, the nasal septum of ordinary width, and the fur not woolly. Nearly all have the hair on the head, except that of the forehead, directed forwards. There are nearly a dozen species. In these monkeys so powerful is the grasp of the tail that the body can be sustained by this organ alone. It even serves as a fifth hand, as detached objects, otherwise out of reach, can be grasped by it, and brought towards the hand or mouth. Their prehension is in other respects exceptionally defective, owing to the loss of the thumb. Spider-monkeys are very gentle in disposition; and, in this their long limbs and fitness for tree-life, seem to represent the gibbons of the Old World. Nevertheless, in spite of their admirable adaptation for arboreal life, their comparably slow progression offers a marked contrast to the vigorous agility of the gibbons (see Spider-Monkey). The brown spider-

![Fig. 14.—Humboldt's Woolly Spider-Monkey (Lagotrichus humboldti).](image)

monkey (Brachytes arachnoides) of south Brazil alone represents a genus connecting the preceding in some degree with the next, a rudimentary thumb being present, while the fur is woolly, the nails are much compressed, and the nostrils more approximated than usual. In the woolly spider-monkeys of the genus Lagotrichus (fig. 14) not only is the fur woolly, but the thumb is fairly well developed; the nails are like those of Brachytes, but the nostrils are normal. Humboldt's spider-monkey, L. humboldti (or L. lagotrichus) and the dusky spider-monkey, L. infumata, both of which occur in Brazil and Amazonia, alone represent this genus.

![Fig. 15.—Lemur-like Douroucouli (Nyctithecus felinus).](image)

the head is divided by a transverse parting, so as to overhang the upper part of the face. P. satanas of Pará, and P. chiroptes of Guiana are well-known species. The uakaris (Uacaria or Colobus) of Amazonia are broadly distinguished from all other Cebidae by their short or rudimentary tails; U. calidus being remarkable for its brilliant red jaw and pale chestnut hair (see UAKARI).
The last and lowest representatives of the Cebidae constitute the sub-family Nyctipithecinae, the members of which are cat-like monkeys, with woolly or bushy hair, short, conical muzzles, non-prehensile tails and well-developed thumbs. The brain-case of the skull is not elongated, and the hemispheres of the brain do not cover the cerebellum. The lumbar vertebrae are elongated, with long, sharp, backwardly directed spinal processes; the hinder part of the lower jaw is tall; and there is no laryngeal sac. The

with more forwardly directed eyes, which are not surrounded by a radiating fringe of hair and a wider nasal septum. The titis are represented by about ten species, of which C. molo is represented in fig. 16. Most of them are confined to Amazonia, but a few occur in Peru and the eastern coast. Like the marmosets, they feed largely upon insects and grubs.

The second and last family of the Platyrrhini is represented by the marmosets or oustitis (Hapalidae), all of which are small monkeys, with the ears hairy externally, and the nails, except that of the great toe, claw-like, the thumb non-opposable, the tail long, bushy and non-prehensile, and only two molars in each jaw, the dental formula thus being: 2, 1, 1, 2. The humerus has no entepicondylar foramen. Three young are produced at a birth. Marmosets are divided into two genera, those in which the lower canines are not markedly larger than the incisors constituting the typical Hapale, while such as have the lower canines taller than the teeth between them form the genus Midas. These squirrel-like little monkeys, in which the great toe can be opposed to the other toes, range as far north as 15° N., where they are represented by Midas geoffroyi, and as far in the opposite direction as the southern tropic, where M. christygnus and M. rotata occur. The colour and the length of the hair are very variable, some species having long silky pale-chestnut hair (fig. 17) and tufted ears, while in others the hair is comparatively short and black, or black with brown bars, while the ears are not tufted (see Marmoset).

Lemurs, Prosimiae.—Although the likeness generally takes the form of a more or less grotesque caricature, the faces of all monkeys and apes present, in greater or less degree, some resemblance to the human countenance. In the lower group of Primates, commonly known as lemurs or lemuroidois, this resemblance is wholly lost, and the face assumes an elongated and fox-like form, totally devoid of that “expression” which is so characteristic of man and the higher apes and monkeys.

PRIMATES

FIG. 16.—The Molo Ch Tit (Callithrix moloche).

long and hooked caecum has its terminal portion constricted. In accordance with their nocturnal habits, the douroucoulis (Nyctitrithecus) are easily recognized by their large and closely approximated eyes, which are, however, separated by a complete septum, the comparatively narrow nasal septum, small ears buried in the

FIG. 17.—The Golden Marmoset (Hapale chrysoteucha).

woolly fur, and long bushy tail. Well-known species are the lemur-like douroucoulis (N. sexitus, fig. 15) of Amazonia, Peru and Ecuador, and N. vociferans, with a nearly similar distribution. The titis, Callithrix (or Callibeus ¹), are smaller monkeys (fig. 16).

¹ Apparently the name Callithrix was originally given to the marmosets, and if transferred to that group should be replaced by Callibeus.
PRIMATES

formula is $i, s, c, p, m$, or the same as in American monkeys; but the upper incisors are small and separated from each other, while the lower ones are large and approximated to the incisor-like canine; the molars have three or four cusps. In all cases the stomach is simple and a caecum present. The testicles are contained in a scrotum, the penis has a bone, the uterus is bifurcated and the urethra perforates the clitoris. The placenta may be either diffuse, with a large allantochorionic portion, and non-decidual, or discoidal and deciduate. As a rule, only a single offspring is produced at a birth. Very noteworthy is the occurrence in the females of the Asiatic loris of what appears to be the vestige of a marsupial apparatus, attached to the front of the pelvis. Lemur cathala also possesses the rudiment of a marsupial fold; while in both sexes of the aye-aye occurs a skin-muscle corresponding to the sphincter marsupii of marsupials.

The distribution of existing lemurs is very peculiar, the majority of the species inhabiting Madagascar, where they for the most part dwell in small patches of forest, and form about one-half the entire mammalian fauna of the island. The remaining species inhabit Africa south of the Sahara and the Indo-Malay countries.

Tarsi.—The tiny little large-eyed Malay lemuroid known as the tarsier, Tarsius spectrum (or T. tardus), of the Malay Peninsula and islands, together with its Celebian and Philippine representatives, alone constitutes the section Tarsius (and the family Tarsiidae) which has the following distinctive characteristics: The lower incisor is vertical and the canine of normal form; the upper incisors are in contact; the orbit is cut off from the temporal fossa by a bony plate, leaving only a small orbital fissure; the tympanic muscles are in the formation of the auditory meatus, through which passes the canal for the tympanic artery; the middle and inner ears are simple; the tibia and fibula in the hind-leg are fused together, and the calcaneum and navicular of the tarsus elongated. The tarsier seems to be a primitive form which takes a certain approximation to the Anthropoides, and differs from them in the mode of its pelage. The dental formula is $i, s, c, p, m, 1$, total 34. Tarsiers have enormous eyes, occupying the whole front of the orbital region, and are purely nocturnal in their habits, living in trees on the trunk of which they climb, and by which they travel, and possess owing to the elongation of the tarsal bones (see TARSIER).

Malagasy Lemurs.—All the other Prosimiae may be grouped in a second section, the Lemurina, characterized as follows: The lower incisors and the canine are similar in form and inclined forwards (fig. 18); the upper incisors are small and separated by an interval in the middle line; the orbits communicate largely with the temporal fossae; the internal carotid artery enters the skull in an anteriorly directed manner through the fenestra lacera anterior; and the tibia and fibula are simple. The Malagasy lemurs are now all included in the single family Lemuridae, which is confined to Madagascar and the Comoro Islands, and characterized by the presence of the ringed lemur, Eulemur, living free in the auditory bush. The typical sub-family Lemurina, which includes the majority of the family group, is characterized by all the fingers except the index having flat nails, the elongation of the facial portion of the skull, the position of the hair on the nose not covering the cerebellum, the occasional presence of two inguinal in addition to two pectoral teats, the dental formula $i, s, c, p, m$, with the first upper incisor generally small and sometimes wanting, and the hinder cusps of the upper molars smaller than the front ones. These lemurs are woolly-haired and arboreal in habits. The molars are all elongated and more or less elongated, and the teeth are simple. The only existing species is Eulemur (fig. 19), which has the largest ears. One of the most beautiful species is the ring-tailed lemur (L. catta, fig. 19), of a delicate grey colour, and with a long tail marked with alternating rings of black and white. This is said by G. A. Shaw to be an exception to other lemurs in not being arboreal, but living chiefly among rocks and bushes. Pollen, however, says that it inhabits the forests of the south-west parts of Madagascar, living, like its congeners, in considerable troops, and not differing from them in its habits. He adds that it is extremely gentle, and active and graceful in its movements, and utters at intervals a little plaintive cry like that of a cat. All the others have the tail of uniform colour. The largest is L. sartorius, the ruffed lemur, sometimes black and white, and sometimes reddish-brown, the variation apparently not depending on sex or age, but on the individual. In L. macaco the male is black and the female L. mongos, L. fulbus and L. rubriventer are other well-known species.

In all these lemurs the small upper incisors are not in contact with one another or with the canine, in front of which they are both placed. In the species Hapalemur, on the other hand, the upper incisors are very small, sub-equal and separated widely in the middle line; those of each side in contact with each other and with the canine, the posterior one being placed on the inside, and not in front of the latter. Muscle very short and truncated. Two inguinal teats, in addition to the normal pectoral pair, are present. The last premolar is broader than those in front, and the upper molars lack a distinct cingulum. The typical H. griseus is smaller than any of the true lemurs, of a dark-grey colour, with round face and short ears. It is quite nocturnal, and lives chiefly among bamboos, subsisting on the young shoots. The second species has been named H. simus. In Hapalemur there is no free cartilage to the carpus, and the same is the case with the six or seven species of Lepilemur (Lepilemur), in which the first upper incisor is rudimentary or wanting, while the second may also be wanting in the adult. There are small lemus, with small premaxillae, short snout, tails shorter than the body, bladder-like vent, and a few species of Palaeolemuroides among the cases of the last two rudimentary; the fourth upper premolar being relatively broad. Microcebus caniceps is an allied generic type (see Lemur).

The small Malagasy lemurs of the genera Chirogale, Microcebus and Opalemur differ from the preceding in the elongation of the calcarine and navicular of the tarsus, on which grounds they have been affiliated to the African galagos. The difference in the structure of the tympanum in the two groups indicates, however, that the elongation of the tarsus has been independently developed in each group. These lemurs have short, rounded skulls, large eyes, long hind limbs and tail, large ears, the upper incisor larger than the second, the last upper premolar much smaller than the first molar and furnished with only one outer cusp, and the mastoid not bladder-like. Some are less than a rat in size, and all are nocturnal. One of the largest, Microcebus furnieri, is reddish-grey, and distinguished by a dark median stripe on its back which divides on the top of the head into two branches, one of which passes forwards above each eye. The most interesting peculiarity of these
lemburs is that certain species (Otolemur gamali, Chirotale mili, &c,) during the dry season coil themselves up in holes of trees, and pass into a state of torpidity, like that of the hibernating animals in the winter of northern climates. Before this takes place an immense deposit of fat accumulates upon certain parts of the body, especially the basal portion of the tail. The smallest species, M. pusillus, lives among the slender branches on the tops of the highest trees, feeding on fruit and insects, and making nests like those of birds.

In the sub-family Indriiniæ, the dentition of the adult consists of thirty teeth, usually expressed by the formula t. 4, c. 4, p. 4, m. 4; but possibly 1. 4, c. 4, p. 4, m. 8. In the milk-dentition there are twenty-two teeth, the two additional teeth in the fore part of the lower jaw having no successors in the permanent series. Hind limbs greatly developed, but the tarsus normal, the great toe of large size, and very opposable; the other toes united at their base by a fold of skin, which extends as far as the end of the phalange. The thumb is but slightly opposable and all the fingers and toes are hairy. The length of the tail is variable. Two pectoral teats. Caecum very large. and colon extremely long and spirally coiled. The brain is large and the thorax wide.

The animals of this group are essentially arboreal, and feed exclusively on fruit, leaves, buds and flowers. When they descend to the ground, which is but seldom, they sit upright on their hind legs, and move from one clump of trees to another by a series of short jumps, holding their arms above them in the air. Among them are the largest members of the order. The genus Indris has the upper incisors sub-equal in size; upper canine larger than the first premolar, muzzle moderately long, ears exerted. Carpus without an os centrale. Tail rudimentary. Vertebræ: C.7, D.12, L.9, S.4, C.5.9. The indri (I. brevicaudatus, fig. 20), discovered by Sonnerat in 1780, is the largest of the group, and has long woolly hair, partly brown and partly white. In the afakas, Propithecia, of which there appear to be three species, with numerous local races, the second upper incisor is much smaller than the first. Upper canine larger than the first premolar. Muzzle rather short. Ears short, concealed by the fur. An os centrale in the carpus. Tail long. Vertebræ: C.7, D.12, L.8, S.5, C.26. In Aousis, represented only by J. laniger, the second upper incisor is larger than the first. Upper canine scarcely larger than the first premolar. Muzzle very short. Ears very small and hidden in the fur, which is very short and woolly. Carpus without os centrale. Tail long. Vertebrae: C.7, D.13, L.6, S.3, C.22-26 (see Indri and Sifaka).

The last sub-family, Chiropterygiæ (formerly regarded as a family), is represented only by the aye-aye, Chiromys (or Daubentonia) madagascariensis, and has the following characteristics: Dentition of adult, i. 4, c. 4, p. 4, m. 4, total 18. Incisors (fig. 21) very large, compressed, curved, with persistent pulps and enamel only in front, as in rodents. Teeth of cheek-series with flat indistinctly tuberculated crowns. In the young, the first set of teeth more resemble those of normal lemurs, being i. 1, c. 1, p. 1, m. 1, all very small. Four

PRIMATES
PRIMATES

premaxillary bones projecting but very slightly in front of the maxillae. Body and limbs stout. No tail. Vertebræ: C.7, D.17, L.6, S.3, C.12. The single species N. tardigradus, with several races, inhabits eastern Bengal, the Malay countries, Sumatra, Borneo, Java, Siam and Cochinchina. These lorises lead solitary lives in the recesses of large forests, chiefly in mountainous districts, where they sleep during the day in holes or fissures of large trees, rolled up into a ball, with the head between the hind legs. On the approach of danger they awake, stretching they arise, and during the night time the branches of trees slowly, in search of food, which consists of leaves and fruit, small birds, insects and mice. When in quest of living prey they move noiselessly till quite close, and then suddenly seize the animal in their hands. There is one species (Nycticebus) which one young at a time. In the second genus, represented only by the slender loris (Loris gracilis) of southern India and Ceylon, the upper incisors are very small and equal. Orbits very large, and the animal resembles the mider races by a large plate of bone. Nasals and premaxillae produced forwards considerably beyond the anterior limits of the maxillae, and supporting a pointed nose. Body and limbs slender. No external tail. Vertebræ: C.7, D.14, L.7, S.3, C.9.

EXTINCT PRIMATES

The most interesting of all the extinct representatives of the order is Pithecanthropus erectus (q.v.), which is represented by the imperfect roof of a skull, two molars and a femur, discovered in a bed of volcanic ash in Java. The forehead is extremely low, with beeting brow-ridges, and the whole calvarium presents a curiously gibbon-like aspect. The capacity of the brain-case is estimated to have equalled two-thirds of that of an average modern man. The creature is regarded as transitional between the higher apes, more especially the Hylobatidae and the lowest representatives of the genus Homo, such as the Neanderthal men. From the Lower Pliocene of India has been obtained the partial skeleton of a chimpanzee-like ape, which has been referred to the genus Anthropus, while by others it is considered to represent a genus by itself—Palaopithecus. The same formation has yielded the canine tooth of a large ape, apparently referable to the existing Asiatic genus Simia. From the Miocene of Europe has been described the genus Dryopithecus, typified by D. fontani, a generalized ape of the size of a chimpanzee, related, perhaps, both to the Simiidae and the Hylobatidae. The Lower Pliocene of Germany has yielded other remains referred to a distinct genus under the name of Palaopithecus rhenanus. From the Miocene of the Vienna basin Dr O. Abel has described certain ape-remains under the name of Griphopithecus suessi, as well as others regarded as representing a species of Dryopithecus with the name D. darwinii. As regards the first, all that can be said is that it indicates a member of the group to which Dryopithecus belongs. It has been suggested that the latter genus is closely related to man, but this idea is by an exceedingly thin apne of a great length of the vertebrae and the small space for the tongue. Teeth of another man-like ape from the Tertiary of Swabia, described under the preoccupied name Anthropus, have been re-named Neopithecus. The genus Anthropus is represented by remains of an ape of doubtful position from the French Pliocene. Pliopithecus from the French Miocene is certainly a gibbon, perhaps not distinguishable from Hylobates. 

Oreopithecus, from the Miocene of Tuscany, is perhaps intermediate between gibbons and baboons (Papio), the latter of which, as well as Macacus, are represented in the Indian Pliocene. Mesopithecus, of the Grecian Lower Pliocene, presents some characters connecting it with Semnopithecus and others with Macacus. An allied type from the Lower Pliocene of France is Dolichopithecus, taking its name from the elongated skull; while Macacus occurs in the Upper Pliocene and Pleistocene of several parts of Europe. Cryptopithecus, from the Swiss Oligocene, appears to be the oldest known Old World monkey. From the Miocene of Patagonia are known certain monkeys described as Homunculus, Anthropops, &c., apparently more akin to the Cebidae, but perhaps representing an extinct family.

Passing on to the lemurs, it may be mentioned in the first place that G. Grandiier has described an extinct lemur from the Tertiary of France, which he believes to be nearly related to the slow lorises, and has accordingly named Pronycticebus gaudryi. If the determination be correct the discovery is of interest as tending to link the modern faunas of southern India and West Africa (which possess many features in common) with the Tertiary fauna of Europe. Certain remarkable extinct lemniroids of large size have been discovered in the superficial deposits of Madagascar, in one of which (Megaladapis) the upper cheek-teeth are of a tritubercular type (fig. 23), while in the second and smaller form (Nesopithecus) the dentition makes a notable approximation to that of the Cercopithecidae. Each of these genera, which probably survived till a very late date, is generally regarded as typifying a family group. In Megaladapis the skull is distinguished by its elongation and the small size of the eye-sockets, the tritubercular upper molars presenting considerable resemblance to those of the living Lepidolemur. The brain is of a remarkably low type. In one species the approximate length of the skull is 250, and in the second 350 millimetres. Even more interesting are the two large species of Nesopithecus, one of which was at first described as Globilemur. They show a very complicated type of brain, and were at first regarded as Indicating Malagasy representatives of the Anthropoidea. In regard to the character of the tympanic region of the skull, this genus shows several features characteristic of the more typical Malagasy lemuroids; and the eye-sockets are open behind, while the dentition is numerically the same as in some of the latter. On the other hand, in several features Nesopithecus resembles the Anthropoidea; the upper incisors are not separated in the middle line, and the upper molars
present the pattern found in the Cercopithecidae, while in one species the lachrymal bone and foramen are within the orbit. The resemblances to apes are not confined to the skull, but are found in almost all the bones. Probably the genus may be regarded as a specialized lemuroid. The Oligocene and Eocene formations of Europe and North America have yielded remains of a number of primitive lemuroids, grouped together under the name of Mesodonta or Pseudolemures, and divided into families severally typified by the genera Hyopsodus, Notharctus, Anaptomorphus and Microchoerus (Necrolemur), of which the last two are European and the others American. To particularize the characteristics of the different families would occupy too much space, and only the following features of the group can be mentioned. The dental formula is 1:1:1, c:1, p:4 or 5, m:3. The canines are often large; the upper molars carry from three to six cusps, while the lower ones are of the tuberculo-sectorial type with either four or five cusps. The lachrymal foramen may be either within or without the orbit, which is in free communication with the temporal fossa, with or without a complete bony ring. The humerus has an entepicondylar foramen. It is specially noteworthy that Adapis resembles the Lemurids in the form and relations of the tympanic ring. Anaptomorphus has large orbits and tritubercular molars. Certain Middle and Lower Eocene North American genera, such as Mixoedectes and Polygolodus, together with the European Plesiadapis and Proloaadapis, which have been regarded as lemuroids, are now frequently referred to the Rodentia (q.v.). On the other hand, Melachiromys, of the Bridger Eocene of America, originally described as a relative of Chiromys, has been stated to be an aradillo.

**PRIME, PRIMER AND PRIMING.** These three words are to be referred to Lat. *primus*, first, *primum*, in O. Eng. *primus*, occurs first in the ecclesiastical sense of the Latin *prima hora*, the first hour, one of the lesser canonical hours of the Roman Church (see BREVIA). Hence the word "primer" (Med. Lat. *primarius*), i.e. a book of hours. This was a book for the use of the laity and not strictly a service book. These books originally contained parts of the offices for the canonical hours, the penitential and other psalms, the *kyrie*, devotions, and other matter. There were several "primers" printed in the reign of Henry VIII; the King’s *Primer* of 1545 contained the Calendar, the Commandments, Creed, Lord’s Prayer, the penitential psalms, Litany and prayers for special occasions. The printer of William Marshall, the printer and reformer, 1534, is entitled *The Primer in English*, with certain prayers and godly meditations, very necessary for all people that understand not the Lowde Tongue. Later printers contained the *Catechism*, the prayers before and after meals, and the A. B. C. They were published for children, like the earlier Sarum Primer (1537), and became educational in purpose, as reading books. The earlier primers were also used in this way, as is shown by the “littel child” of Chaucer’s *Prisors Tale*, who sitting “at his prymre, redemptorie herde syngye.” Thus “primer” or “primyrm” became the regular name for an elementary book for learners. For the type known as “great primer” and “long primer,” see TYPOGRAPHY.

Apart from the use of “prime” as the period of greatest vigour of life, the first of the guards in fencing, and for those numbers which have no divisors except themselves and unity (see ARITHMETIC), the principal use is that of the verb, in the sense of to insert in the pan of an old-fashioned small arm, the “primer,” containing powder which, on explosion by percussion, fires the charge. This use seems to be due to “priming” being the first stage in the discharge of the weapon. Finally “priming” is the first cost of size or colour laid on a surface as a preparation for the body colour.

**PRIME MINISTER** or Premier, in England, the first minister of the Crown. Until 1905 the office of prime minister was unknown to the law, but by a royal warrant of the end of December of that year the holder of the office, as such, was given precedence next after the archbishop of York. The prime minister is the medium of intercourse between the cabinet and the sovereign; he has to be cognizant of all matters of real importance that take place in the different departments so as to exercise a controlling influence in the cabinet; he is virtually responsible for the disposal of the entire patronage of the Crown; he selects his colleagues, and by his resignation of office dissolves the ministry. Yet he was until 1905, in theory at least, but the equal of the colleagues he appointed. The prime minister is nominated by the sovereign. “I offered,” said Sir Robert Peel on his resignation of office, “no opinion as to the choice of a successor. That is almost the only act which is the personal act of the sovereign; it is for the sovereign to determine in whom her confidence shall be placed.” Yet this selection by the Crown is practically limited. No prime minister could carry on the government of the country for any length of time who did not possess the confidence of the House of Commons. The prime minister has no salary as prime minister, but he usually holds the premiership in connexion with the first lordship of the treasury, the chancellorship of the exchequer, a secretariery of state or the privy seal. Sir Robert Walpole must be regarded as the first prime minister—that is, a minister who imposed harmonious action upon his colleagues in the cabinet. This was brought about partly by the capacity of the man himself, partly by the lack of interest of George I. and II. in English home affairs. This creation, as it were, of a superior minister was so gradually and silently effected that it is difficult to realize its true influence. The greatest of all prime ministers was Sir Robert Walpole except so far as one member of the administration dominated over his colleagues by the force of character and intelligence. In the reign of George III, even North and Addington were universally acknowledged by the title of prime minister, though they had little claim to the independence of action of a Walpole or a Pitt.

1 The first formal mention in a public document appears to be in 1783, where, in the opening clause of the treaty of Berlin, the earl of Beaconsfield is referred to as “First Lord of Her Majesty’s Treasury, Prime Minister of England.”
PRIMERO—PRIMITIVE METHODIST CHURCH, THE

PRIMO (Span. first), a card game of Spanish origin, which Strutt calls "the oldest game of cards played in England." It is described as having a close resemblance to Ombre (p. 11), by which it had been superseded. The spadillo or ace of spades was the best card, but Primero was played with six cards and Ombre with nine. The exact method of play is uncertain.

PRIME VERTICAL, in astronomy, the vertical circle passing east and west through the zenith, and intersecting the horizon in its east and west points (see ASTRONOMY).

PRIMITIVE METHODIST CHURCH, THE, a community of nonconformists, which owes its origin to the fact that Methodism as founded by the Wesleyans tended, after the first generation, to depart from the enthusiasm that had marked its inception and to settle down to the task of self-organization. There were, however, some ardent spirits who continued to work along the old lines and whose watchword was revivalism, and out of their efforts came the Bible Christian, the Independent Methodist and the Primitive Methodist denominations. These enthusiastic evangelists esteemed zeal a higher virtue than discipline and decorum, and put small emphasis on church systems as compared with conversions. One of the men to whom Primitive Methodism owes its existence was Hugh Bourne (1777-1853), a millwright of Stoke-upon-Trent. He joined a Methodist society at Burslem, but business taking him at the close of 1800 to the colliery district of Harrisehead and Kidsgrove, he was so impressed by the prevailing ignorance and debasement that he began a religious revival of the district. His open-air preaching was accompanied by prayer and singing, a departure from Wesley's practice and the forerunner of the well-known "Camp Meeting." A chapel was built at Harrisehead, and a second revival occurred in September 1804, largely the result of a meeting held at Congleton by some enthusiasts from Southport. One of the after-fruits of this revival was the conversion (Jan. 1805) of the joint founder of Primitive Methodism, William Clowes (1780-1851), a native of Burslem, who had come to Tunstall. Clowes was a man of fine appearance and open countenance, with a compelling personality that found expression in a steady glance and a thrilling voice. He was a potter by trade, and had a national reputation as a dancer. He joined a Methodist class, threw his house open for love-feasts and prayer-meetings, and did a great deal of itinerant evangelization among the cottages of the countryside. Lorenzo Dow (1777-1834), an eccentric American Methodist revivalist, visited North Staffordshire and spoke of the camp-meetings held in America, with the result that on the 31st of May 1807 the first real English gathering of the kind was held on Mow Cop, since regarded as the Mecca of Primitive Methodism. It lasted from 6 a.m. to 8 p.m., and Bourne and his friends determined to continue the experiment as a counterblast to the parish wakes of the time, which were little better than local saturnalia. Opposition from a master potter of the district, who threatened to put the Conventicle Act in force, was overcome, but more serious difficulties were presented by the antagonism of the Wesleyan Methodist circuit authorities. But Bourne and his friends persisted against both Conference and the local superintendant, who issued bills declaring that no camp-meeting would be held at Norton in August 1807. The meeting was held and ten months later Bourne was expelled by the Burslem Quarterly Meeting, ostensibly for non-attendance at class (he had been away from home, evangelizing), really, as the Wesleyan superintendent told him "because you have a tendency to set up other than the ordinary worship" which was precisely the reason why, fifty years earlier, the Anglican Church had declined to sanction the methods of John Wesley. The camp-meetings went steadily on, and their influence is reflected in the writings of George Eliot, George Borrow and William Howitt. The societies which Bourne formed were for a time allowed to go under (Wesleyan) Methodist protection, but the crisis came in 1810, when the Stanley class of ten members declined to wash their hands of the Camp-Meeting Methodists, and so were refused admission. About this time, too (1809), Bourne appointed James Crawfoot, a Wesleyan local preacher who had been removed from the list for assisting the Independent Methodists, as a travelling preacher at £s. a week, instructing him to give his whole time to evangelization and to get his converts to join the denominations to which they were most inclined. Crawfoot, who, in spite of his revivalist sympathies, was more attached to Methodism than Bourne, was cut off from his church for taking part in camp-meetings at Ramsor in 1808 and 1810. His personality drew a number of strong men after him, and a society meeting held in a kitchen and then in a warehouse became the nucleus of a circuit, a chapel being built at Tunstall in July 1811, two months after the fusion of the Bourne and Crawfoot forces. Crawfoot, like Crawfoot, was set apart as a preacher to "live by the gospel," and in February 1812 the name "Primitive Methodist" was formally adopted, although for nearly a generation the name "Clowesites" survived in local use.

The first distinct period in the history of Primitive Methodism proper is 1811-1833. It was a time of rapid expansion, marked by great missionary fervour, and may be called the Circuit period. There were few churches in districts where the Methodists had been in 1821; they did not lose their privilege of missionary initiative. The line of geographical progress first followed the valley of the Trent. The original circuit at Tunstall no sooner felt its feet than it favoured consolidation rather than extension. But irresponsibles like John Benton broke through the "non-mission law," and pressed forward through the "Adam Bede" country to Derby (which became the 2nd circuit in 1816); Nottingham, where a great camp-meeting on Whit Sunday 1816 was attended by 12,000 people: Leicestershire, where Loughborough became the 3rd circuit, with extensions into Rutland, Lincolnshire and Norfol; and ultimately to Hull, which became the 4th circuit, and where a meeting which deserves to be called the First Conference was held in June 1819. The Hull circuit during the next five years, through its Yorkshire, Western, North-Western and Northern Missions, carried on a vigorous campaign with great success, especially among the then semi-savage Yorkshire. Some years later, between the years 1819-1824 there had been made from Hull 17 circuits with a membership of 7600, and Hull itself had 3400 more.

Simultaneously with this work in the north, Tunstall circuit, having thrown off its lethargy at the Wrose Hill camp-meeting on the 23rd of May 1819, was carrying on an aggressive evangelism. In the Black Country, Darlaston circuit was formed in 1820, and John Wedgwood's Cheshire Mission, begun in 1819, led to work in Liverpool on the one hand and in Salop on the other. From Macclesfield a descent was made on Manchester; from Oakengates in South Shropshire came extensions to Herefordshire, Glamorganshire and Wiltshire, where the famous Brinkworth circuit was established. The succeeding years, however, 1825-1828, showed a serious set-back, due to the lack of discipline. But drastic measures were taken, and in one year thirty preachers were struck off the list. Thenceforward, while the Oxford Movement was awakening one section of the people of England the Primitive Methodists were making themselves felt among other classes of the population. John Oxtoby, who evangelized Filey and became known as "Praying Johnny,"
PRIMOGENITURE

was known to spend six hours at a time in intercession. Robert Key at Saham Tony in 1832 won over a young woman who converted her brother, Robert Eaglen, who, eighteen years later at Colchester, proved so decisive a factor in the life of Charles Hadden Spurgeon.

The Times of the 27th of December 1830, referring to the disaffected state of the southern counties, said: "The present population must be provided for in body and spirit on more liberal and Christian principles, or the whole mass of labourers will start into legions of banditti—banditti less criminal than those who have made them so, and who by a just and fearful retribution will soon become their victims." These were the classes the Primitive Methodists tried to reach, and in doing so they found themselves between two fires. On the one hand there was the mob violence that often amounted to sheer rufianism, especially in Wessex and the home-counties. On the other hand there was legal persecution all over the country, and the preachers suffered many things from the hands of rural clergy and county magistrates. There are a score of cases of serious imprisonment, and a countless number of arrests and temporary detention. Local preachers received notice to quit their holdings, labourers were discharged, those who opened their cottages for meetings were evicted, and to show any hospitality to a travelling preacher was to risk the loss of home and employment. But the spirit of the evangelists was unquenchable.

At the Conference of 1842 both Clowes and Bourne became supernumeraries with a pension of £25 a year each. Clowes, indeed, had been free from circuit work since 1827, and he continued to pray and preach as he was able till his death in March 1851. Bourne, who worked at his trade more or less all through life, spent his last ten years in advocating the temperance cause; he died in October 1852. The years 1842–1853 mark a transition period in the history of Primitive Methodism. It was John Flesher who chiefly guided the movement from a loosely joined Home Missionary Organization on to the lines of a real Connexionalism. One of the first steps was to move the Book Room and the meeting place of the executive committee from Bemerton to London. Soon after came the gradual process by which the circuits handed over their mission-work to a central Connexional Committee. The removal to London was proof that the leaders were alive to the necessity of grappling with the rapid growth of towns and cities, and that the Connexion, at first mainly a rural movement, had also urban work to accomplish. The famous Hull circuit long retained a number of powerful branches, a survival of the first period, but by 1853 it had come into line with what was by that time regarded as the normal organization.

The period 1853–1885 (where typical names are W. and S. Antliff, Thomas Bateman and Henry Hodge) finds Primitive Methodism as a connexion of federated districts, a unity which may be described as mechanical rather than organic. The districts between 1853 and 1873 were ten in number, Tunstall, Nottingham, Hull, Sunderland, Norwich, Manchester, Brinkworth, Leeds, Bristol and London. Conference—the supreme assembly—was a very jealously guarded preserve, being attainable only to preachers who had travelled 18 and superintended 12 years, and to laymen who had been members 12 and officials 10 years. This exclusiveness naturally strengthened the popularity and power of the districts, where energy and talent found a scope elsewhere denied. Thus Hull district inaugurated a bold policy of chapel-buildings; Norwich that of a foreign mission; Sunderland and Manchester the ideal of a better-educated ministry, Sunderland institute being opened in 1868; Nottingham district founded a middle-class school; Leeds promoted a union of Sunday-schools, and the placing of chapel property on a better financial footing. The period as a whole had some anxious moments; emigration to the gold-fields and the strife which afflicted Wesleyan Methodism brought loss and confusion between 1853 and 1860. Yet when Conference met at Tunstall in the latter year to celebrate its jubilee it could report 675 ministers and 11,384 local preachers, 132,114 members, 2267 chapels, 167,533 scholars and 39,688 teachers. Overseas, too, there was much activity and success. Work begun in Australia and New Zealand prospered, and the former country finally contributed over 11,000 members to the formation of the United Methodist Church of Australia, New Zealand with its 26,000 members preferring to remain connected with the home country. In the United States there had been a quiet but steady growth since the first agents went out in 1829 and Hugh Bourne's advisory visit in 1844. There are now three Conferences—the Eastern, Pennsylvania and Western, with about 70 ministers, 100 churches and 7000 members. The Canadian churches had a good record, consummated in 1884 when they contributed 8000 members and 100 ministers to the United Methodist Church of the Dominion. In January 1870 the first piece of real foreign missionary work was begun at Fernando Po, followed in December of the same year by the mission at Alliwal North on the Orange River in South Africa. This station is the centre of a large mission-van or district 150 m. by 50 m., and there is a membership of 17,731 and an efficient institution for training teachers, evangelists and artisans. In 1890 another South African mission was started, ultimately locating itself at Mashukulumbwe, and a few years later work was begun in Southern Nigeria.

Since 1885 Primitive Methodism has been developing from a "Connexion" into a "Church," the designation employed since 1902. At home a Union for Social Service was formed in 1906, the natural outcome of Thomas Jackson's efforts for the hungry and distressed in Clapton and Whitechapel, and of similar work at St George's Hall, Southwark. Other significant episodes have been the Unification of the Funds, the Equalization of Districts and the reconstruction of Conference on a broader basis, the Ministers' Sustentation Fund and the Church Extension Fund, and the enlargement and reorganization of the college at Manchester. This undertaking owes much to the liberality of Sir William P. Hartley, whose name the college, which is a school of the Victoria University, now bears. The Christian Endeavour movement in Great Britain derives, perhaps, its greatest force from its Primitive Methodist members; and the appointment of central missions, connexional evangelists and mission-vans, which tour the more sparsely populated rural districts, witness to a continuance of the original spirit of the denomination, while the more cultured side is fostered by the Hartley lecture. In celebration of the centenary of the Church, a fund of £250,000 was launched in 1907, and this was brought to a successful issue. Statistics for 1909 show 1178 ministers, 16,158 local preachers, 221,168 members, 4848 chapels, 465,531 Sunday school scholars, 59,557 teachers. In the United States there were, in 1906, 101 church edifices and a total membership of 75,588.

See H. B. Kendall, The Origin and History of the Primitive Methodist Church (2 vols., 1906); and What hath God Wrought? A Centenary Memorial of the P.M. Church (1908).

(A. J. G.)

PRIMOGENITURE (Lat. primus, first, and genitus, born, from gignere, to bring forth), a term used to signify the preference in inheritance which is given by law, custom or usage, to the eldest son and his issue, or in exceptional cases to the line of the eldest daughter. The practice is almost entirely confined to the United Kingdom, having been abolished by the various civil codes of the European states, and having been rejected in the United States as contrary to the spirit of the constitution. The history of primogeniture is given in the article Succession, while the existing English law will be found in the articles Heir; Inheritance; Will, &c. But it may be briefly said here that the English law provided that in ordinary cases of inheritance to land of intestates the rule of primogeniture shall prevail among the male children of the person from whom descent is to be traced, but not among the females; and this principle is applied throughout all the degrees of relationship. There are exceptions to this rule, as in the cases of "gavelkind" and "borough-English," and in the copyhold lands of a great number of manors, where customs analogous to those of gavelkind and borough-English have existed from time immemorial. In another class of exceptions the rule of primogeniture is applied
to the inheritance of females, who usually take equal shares in each degree. The necessity for a sole succession has, for example, introduced succession by primogeniture among females in the case of the inheritance of the Crown, and a similar necessity led to the maritza or feudal law, that certain dignities and offices acquired for the defence of the realm, and other inheritances under "the law of the sword," should not be divided, but should go to the eldest of the co-heiresses (Bracton, De Legibus, ii. c. 76; Co. Litt., 1650). There are also many other special rules by which the ordinary rule of primogeniture is varied. It may be remarked that the English law of inheritance of land creates a double preference, subject to certain exceptions and customs, in favour of the male over the female and of the first-born among the males. This necessitates the rule of representation by which the issue of children are regarded as standing in the places of their parents, called "representative primogeniture." The rule appears to have been firmly established in England during the reign of Henry III., though its application was favoured as early as the 12th century throughout the numerous contests between brothers claiming by proximity of blood and their nephews claiming by representation, as in the case of King John and his nephew Prince Arthure (Glanvill, vii. c. 3; Bracton, De Legibus, ii. c. 30).

PRIMROSE. The genus Primula contains numerous species distributed throughout the cooler parts of Europe and Asia, and found also on the mountains of Abyssinia and Java; a few are American. They are herbaceous perennials, with a permanent stock from which are emitted tufts of leaves and flower-stems which die down in winter; the new growths formed in autumn remain in a bud-like condition ready to develop in spring. They form the typical genus of Primulaceae (q.v.), the floral conformation of which is very interesting on several accounts independently of the beauty of the flowers. The variation in the length of the stamens and of the style in the flowers of Primula has attracted much attention since Charles Darwin pointed out the true significance of these various arrangements. Briefly it may be said that some of the flowers have short stamens and a long style, while others have long stamens, or stamens inserted so high up that the anthers protrude beyond the corolla tube, and a short style. Gardeners and florists had for centuries been familiar with these variations, called sometimes the flowers "dwarf" or "old-fashioned," and those in which the stigma appeared in the mouth of the tube "pin-eyed." Darwin showed by experiment that the most perfect degree of fertilization, as shown by the greatest number of seeds and the healthiest seedlings, was attained when the pollen from a short-stamened flower was transferred to the stigma of a short-styled flower, or when the pollen from the long stamens was applied to the long style. As in any given flower the stamens are short (or low down in the flower-tube) and the style long, or conversely, it follows that to ensure a high degree of fertilization cross fertilization must occur, and this is effected by the transfer of the pollen from one flower to another by insects. Incomplete fertility arises when the stigma is impregnated by the pollen of the same flower. The size of the pollen-grains and the texture of the stigma are different in the two forms of flower (see figure under Primulaceae). The discovery of the physiological significance of these variations in structure, which had long been noticed, was made by Darwin, and formed the first of a series of similar observations and experiments (see Observations and Experiments on the Different Forms of Flowers, &c.). Among British species may be mentioned the Common Primrose (P. vulgaris); the cowslip (P. veris); the true Oxlip (P. elatior), a rare plant only found in the eastern counties; and the common

1 Lat. primula; Ital. and Span. primaveras; Fr. primrore, or in some provinces primrose. Strangely enough, the word was applied, according to Dr Prior, in the middle ages to the daisy (Bellis perennis), the present usage being of comparatively recent origin.

Oxlip, the flowers of which recall those of the common primrose, but are provided with a supporting stem, as in the cowslip; it is, in fact, a herbaceous perennial, and should be cultivated. In addition to these two species occur in Britain, namely, P. farinosa and P. scoticosa, which occurs in Orkney and Caithness.

These two species are found also in high Arctic latitudes, and P. farinosa, or a very closely allied form, exists in Fuegia.

The Auricula (q.v.) of the gardens is derived from P. Auricula, a yellow-flowered species, a native of the Swiss mountains. The Polyanthus (q.v.), a well-known garden race, is probably derived from P. Polyanthus, an alpine species whose hybrids are in rich species of primrose, often very difficult of determination or limitation, certain forms being peculiar to particular valleys. Of these P. denticulata, Stauritis, siksmakensis, nivalis, floribunda, may be mentioned as frequently cultivated, as well as the lovely rose-coloured species P. rosea.

The Royal Cowslip (P. imperialis) resembles P. japonica, but has leaves measuring 18 in. long by 5 in. wide. It grows at an elevation of 9000 ft. in Java, and has deep yellow or orange flowers.

The primrose is to be had in cultivation in a considerable variety of shades of colour, ranging from the palest yellow to deep crimson and blue. As the varieties do not reproduce quite true from seed, it is customary to increase them by cuttings in early spring. The special kind of primrose is known in its best in heavy soils in slight shade, and with plenty of moisture during the summer.

One of the most popular of winter and early spring decorative plants is the Chinese primrose (Primula florinds), of which some superb strains have been obtained. For ornament purposes young plants are raised annually from seeds, sown about the beginning of March, and again for succession in April and, if needed, in May. The seed should be sown in well-drained pots or pans, in a compost of loam, leaf-mould, and ordinary garden soil, and covered with part clean gritty sand, as it does not germinate freely if the soil contains stagnant moisture, afterwards placing a sheet of glass over the pans to prevent evaporation of moisture. When the seedlings are large enough to handle, prick them out in pans or boxes, and later on in pots, as soon as they have made leaves an inch long, pot them singly in 3-in. pots, using in the soil a little rotten dung. They should then be placed in a light frame near the glass in an open situation, facing the north. When their pots are filled with roots they should be moved into 6-in. or 7-in. pots. The soil should be a mixture of two parts garden loam with the same amount of leaf-mould, and as much sand as will keep the whole open. They should be potted firmly, and kept in frames close up to the glass till September, excess in watering being carefully avoided. In the autumn they should be transferred to a light house and placed near the glass, the atmosphere being kept dry by the occasional use of fire-heat. The night temperature should be kept about 45°. When the flowering stems are growing upwards they should be well kept moist, the top leaves being removed to keep the flower-buds free from ex-cess of moisture, but that is the worst enemy of the choice Alpine varieties. They are propagated by seed and by division of the crowns after flowering. P. Foresti is a quite new orange-yellow flowered species from China; also P. Bulleyi. They are probably hardy—at least in favoured spots.

Evening primrose belongs to the genus Oenothera (natural order Onagraceae), natives of temperate North and South America. The common evening primrose, Oen. biennis, has become naturalized in Britain and elsewhere in Europe; the form or species known as var. grandiiflora or Oen. Lamarckiana is a very showy plant with large flowers than in the common form. Other species known in gardens are the evening primrose, var. hybridus, which has strap-shaped trailing branches, lance-shaped leaves and large yellow blossoms; Oen. taraxacifolia, 6 to 12 in., which has a stout crown from which the trailing branches spring out, and these bear very large white flowers changing to delicate rose; this is widely grown in gardens, and should therefore be raised from seed annually. Of erect habit are Oen. spectabilis, 1 to 2 ft., with large white flowers; Oen. frutcosa, 2 to 3 ft., with abundant yellow flowers.

The name of Cape Primrose has been given to some by the hybrid forms of Strobloecarpus, a South African genus belonging to the natural order Gesneraceae.
PRIMROSE LEAGUE, THE—PRIMULACEAE

PRIMROSE LEAGUE, THE, an organization for spreading Conservative principles amongst the British democracy. The primrose is associated with the name of Lord Beaconsfield (q.v.), as being preferred by him to other flowers. On a card affixed to the wreath of primroses sent by Queen Victoria to be placed upon his coffin was written in Her Majesty’s own handwriting: “His favourite flowers: from Osborne: a tribute of affectionate regard from Queen Victoria.” On the day of the unveiling of Lord Beaconsfield’s statue all the members of the Conservative party in the House of Commons were decorated with the primrose. A small group had for some time discussed the means for obtaining for Conservative principles the support of the people. Sir H. D. Wolf therefore said to Lord Randolph Churchill, “Let us found a primrose league.” The idea was accepted by several gentlemen in the habit of working together, and a meeting was held at the Carlton Club shortly afterwards, consisting Lord Randolph Churchill, Sir H. Drummond Wolfe, Mr (afterwards Sir John) Gorst, Mr Percy Mitford, Colonel Fred Burnaby and some others, to whom were subsequently added Mr. J. B. Stone, Mr Rowlands and some Birmingham supporters of Colonel Fred Burnaby, who also wished to return Lord Randolph Churchill as a Conservative member for that city. These gentlemen were of great service in remodelling the original statutes first drawn up by Sir H. Drummond Wolfe. The latter had for some years perceived the influence exercised in benefit societies by badges and titular appellations, and he further endeavoured to devise some quaint phraseology which would be attractive to the working classes. The title of Knight Harbinger was taken from an office no longer existing in the Royal Household, and a regular gradation was instituted for the honorary titles and decorations assigned to members. This idea, though at first ridiculed, has been greatly developed since the foundation of the order; and new distinctions and decorations have been founded, also contributing to the attractions of the league. The League was partially copied from the organization of the Order of the Sons of the Empire in Ireland. In lieu of calling the different subsidiary associations by the ordinary term “Lodges,” the name was given of “Habitations,” which could be constituted with thirteen members. These were intended as a substitute for the paid canvassers, about to be abolished by Mr Gladstone’s Reform Bill. The principles of the League are best explained in the declaration which every member is asked to sign: “I declare on my honour and faith that I will devote my best ability to the maintenance of religion, of the estates of the realm, and of the imperial ascendency of the British Empire; and that, consistently with my allegiance to the sovereign of these realms, I will promote with discretion and fidelity the above objects, being those of the Primrose League.” The motto was “Imperium et libertas”; the seal, three primroses; and the badge, a monogram containing the letters PL, surrounded by primroses. Many other badges and various articles of jewellery have since been designed, with this flower as an emblem.

A small office was first taken on a second floor in Essex Street, Strand; but this had soon to be abandoned, as the dimensions of the League rapidly increased. Ladies were generally included in the first organization of the League, but subsequently a separate Ladies’ Branch and Grand Council were formed. The founder of the Ladies’ Grand Council was Lady Borthwick (afterwards Lady Glenesk), and the first meeting of the committee took place at her house in Piccadilly on the 2nd of March 1885. The ladies who formed the first committee were: Lady Borthwick, the dowager-duchess of Marlborough (first lady president), Lady Wimborne, Lady Randolph Churchill, Lady Charles Beresford, the dowager-marchioness of Waterford, Julia marchioness of Tweeddale, Julia countess of Jersey, Mrs (subsequently Lady) Hardman, Lady Dorothy Nevill, the Honourable Lady Campbell (later Lady Blythwood), the Honourable Mrs Nevill, Mrs Bischoffsheim, Miss Meresia Nevill (the first secretary of the Ladies’ Council).

When the League had become a success, it was joined by Lord Salisbury and Sir Stafford Northcote, who were elected Grand Masters. Its numbers gradually increased to a marvellous extent, as may be seen by the following figures:

(H. D. W.)

PRIMULACEAE, in botany, an order of Gamopetalous Dicotyledons belonging to the series Primulales and containing 28 genera with about 350 species. It is cosmopolitan in distribution, but the majority of the species are confined to the temperate and colder parts of the northern hemisphere and many are arctic or alpine. Eight genera are represented in the British flora.

The plants are herbs, sometimes annual as in pimpernel (Anagallis arvensis) (fig. 1), but generally perennial as in Primula,

(After Wossidlo. From Strasburger’s Lehrbuch der Botanik, by permission of Gustav Fischer.)

**Fig. 1.** Anagallis arvensis (pimpernel),

4. Seed.

where the plant persists by means of a sympodial rhizome, or in Cyclamen by means of a tuber formed from the swollen hypocotyl. The leaves form a radical rosette as in Primula (primrose, cowslip, &c.), or there is a well-developed aerial stem which is erect, as in species of Lysimachia, or creeping, as in Lysimachia Nummularia (creeping jenny or money-wort). Hottonia (water violet) is a floating water plant with submerged leaves cut into fine linear segments. The leaves are generally simple, often with a toothed margin; their arrangement is alternate, opposite or whorled, all three forms occurring in one and the same genus Lysimachia. The flowers are solitary in the leaf-axis as in pimpernel, money-wort, &c., or umbellled as in primrose, where the umbel is sessile, and cowslip, where it is stalked, or in racemes or spikes as in species of Lysimachia. Each flower is subtended by a bract, but there are no bracteoles, and corresponding with the absence of the latter the two first developed sepals stand right and left (fig. 2).

The flowers are hermaphrodite and regular with parts in fives (pentameras) throughout, though exceptions from the pentameras arrangement occur. The sepals are leafy and persistent; the corolla is generally divided into a longer or shorter tube and a limb which is spreading, as in primrose, or reflexed, as in Cyclamen; in Soldanella it is bell-shaped; in Lysimachia the tube is often very short, the petals appearing almost free; in Glaux the petals are absent. The five stamens spring from the corolla-tube and are

**Fig. 2.** Diagram of a typical flower of Primulaceae.
opposite to its lobes; this anomalous position is generally explained by assuming that an outer whorl of stamens opposite the sepals has disappeared, though sometimes represented by scales as in *Samolus* and *Soldanella*. Another explanation is based on the late appearance of the petals in the floral development and their origin from the backs of the primordia of the stamens; it is then assumed that three alternating whorls only are present, namely, sepals, stamens bearing petal-like dorsal outgrowths, and carpels. The superior ovary—half-inferior in *Samolus*—bears a simple style ending in a capitulate entire stigma, and contains a free-central placenta bearing generally a large number of ovules, which are exceptional in the group Gamopetalae in having two integuments. The fruit is a capsule dehiscing by 5 sometimes 10 teeth or valves, or sometimes transversely (a pyxidium) as in *Anagallis*.

Cross pollination is often favoured by dimorphism of the flower, as shown in species of *Primula* (fig. 3). The two forms have long and short styles respectively, the stamens occupying corresponding positions half-way down or at the mouth of the corolla-tube; the long-styled flowers have smaller pollen-grains, which correspond with smaller stigmatic papillae on the short styles.

The order is divided into five tribes by characters based on differences in position of the ovules—which are generally semi-anatropous so that the seed is peltate with the hilum in the centre on one side (or ventral), but sometimes, as in *Hottonia* and *Samolus*; anatropous with the hilum basal—together with the method of dehiscence of the capsule and the relative position of the ovary. The chief British genera are *Primula*, including *P. vulgaris*, primrose, *P. veris*, cowslip, *P. eliator*, oxlip, and the small alpine species *P. farinosa*, with mealy leaves; *Lysimachia*, loose strief, including *L. Nummularia*, money-wort; *Anagallis*, pimpernel; and *Hottonia*, water violet.

**PRIMULINE**, a dye-stuff containing the thiazeol ring system conjointly with a benzene ring. The primulines are to be considered as derivatives of dehydrothiotoluidine (aminobenzoylthioanilide), which is obtained when para-toluino-

Ch

Primuline.

dine is heated with sulphur for eighteen hours at 180–190° C. and then for a further six hours at 200–220° C. (P. Jacobson, *Ber.*, 1889, 22, p. 333; L. Gattermann, ibid. p. 1084). Dehydrothiotoluidine is not itself a dye-stuff, but if the heating be carried out at a higher temperature in the presence of more sulphur, then a base is formed, which gives primuline-yellow on sulphonation (A. G. Green, *Journ. Soc. Chem. Ind.*, 1888, 1, p. 194). Primuline-yellow is a mixture of sodium salts and probably contains in the molecule at least three thiazole rings

---

**PRIMUS, MARCUS ANTONIUS**, Roman general. He was born at Tolosa in Gaul about a.d. 30–35. During the reign of Nero he was resident in Rome and a member of the senate, from which he was expelled for forgery in connexion with a will and was banished from the city. He was subsequently reinstated by Galba, and placed in command of the 7th legion in Pannonia. During the civil war he was one of Vespasian’s strongest supporters. Advancing into Italy, he gained a decisive victory over the Vitellians at Bedriacum (or Betriacium) in October 69, and on the same day stormed and set fire to Cremona. He then crossed the Apennines, and made his way to Rome, into which he forced an entrance after considerable opposition. Vitellius was seized and put to death. For a few days Primus was virtually ruler of Rome, and the senate bestowed upon him the rank and insignia of a consul. But on the arrival of Linius Mucianus he was not only obliged to surrender his authority, but was treated with such ignominy that he left Rome. Primus must have been alive during the reign of Domitian, since four epigrams of Martial are addressed to him. Tacitus describes him as brave in action, ready of speech, clever at bringing others into_MB_342

---

**PRIMA, GIUSEPPE** (1768–1814), Italian statesman. He gave early proofs of rare talent, and after studying at the University of Pavia he passed as doctor of law in 1780. He was a firm adherent of Napoleon Bonaparte, and when Eugene Beauharnais became viceroy of Italy, he was appointed minister of finance. Genial in private life, he was harsh and unyielding in his official capacity, and his singular skill in devising fresh taxes to meet the enormous demands of Napoleon's government made him the most hated man in Lombardy, the more so that, being a Piedmontese, he was regarded as a foreigner. The news of the emperor's forced abdication on the 11th of April 1814 reached Milan on the 16th, and roused hopes of independence. The senate assembled on the 19th and Prima's party moved that delegates should be despatched to Vienna to request that Eugene Beauharnais should be raised to the throne of a free Italian kingdom. In spite of precautions this fact became public and provoked the formidable riot styled "the battle of the umbrellas" that broke out the next day. A furious mob burst into the senate, pillaged its halls and sought everywhere for the executed Prima. Not finding him there, the rioters rushed to his house, which they wrecked, and seizing the doomed minister, who was discovered in a remote chamber domining a disgrace, during four hours dragged him about the town, until wounded, mutilated, almost torn to pieces, he received his death-blow. The mob then insulted his miserable remains, stuffing stamped-paper into his mouth. These horrors were enacted by day, in a thoroughfare crowded with "respectable" citizens sheltered from the rain by umbrellas. The authorities were passive, and although some courageous persons actually rescued the victim at an early stage and concealed him in a friendly house, the blood-thirsty mob soon discovered his refuge and were about to force an entrance, when the dying man surrendered to save his deliverer's property. The riots directly contributed to the re-establishment of Austrian rule in Milan.
1902); Ugo Foscolo, Alcune parole interno alla fine del regno d'Italia. The story of the murder of Prina forms the subject of a play by G. Rovetta, entitled Principe di secolo.

**PRINCE** (Lat. princeps, from primus capio, "I am the first to take"); Ital. principe, Fr. prince, a title implying either political power or social rank. The Latin word princeps originally signified "the first" either in place or action (cf. Ger. Fürst; O.H.G. forist = English "first"). As an honorary title it was applied in the Roman republic to the senatori senatus, i.e. the senator who stood first on the censor's list, and the princeps juvenile, i.e. the first on the roll of the equestrian order. The assumption of the style of princeps senatus by Augustus (a.d.) first associated the word with the idea of sovereignty and dominion, but throughout the period of the empire it is still used as a title of certain civil or military officials (e.g. princeps officii, for the chief officer of a provincial governor, in the Theodosian code, leg. i., De offic. rect. prot. i. 7; princeps militiae, i.e. the commander of a cohort or legion); while in the middle ages the term is still applied vaguely in charters to the magnates of the state or the high officials of the palace, princeps being treated as the equivalent of provers, optimates or seniores. Yet this idea of sovereignty as implied in the word princeps, used as a title rather than as a designation, survived the Visigothic and Lombard codes princeps is the equivalent of rex or imperator; and when, after the overthrow of the Lombard kingdom by the Franks, Archis II. (d. 787) of Beneventum wished to assert his independent sovereignty, he had himself anointed and crowned, and exchanged his style of duke for that of prince.

From Italy the use of the title spread—first, with the Crusaders, to the Holy Land, where Bohemund, son of Tancred, took the style of prince of Antioch; next, with the Latin conquerors, into the East Roman Empire, where in 1205 William de Champllete, a cadet of the house of Champagne, founded the principality of Achaena and the Morea. This example was followed by lesser magnates, who styled themselves loosely, or were so styled by the chroniclers, "princes," even though they had little claim to independent sovereignty. From the East the fashion was carried back to France; but there the erection of certain fiefs into "principalities," which became common in the 15th and 16th centuries, certainly implied no concept of independent sovereignty, and the title of "prince," thus bestowed ranked below that of "duke," being sometimes borne by cadet branches of ducal houses, e.g. the princes of Léon and of Soubise, cadets of the house of Rohan. On the other hand, the title of "prince" was borne from the time of Charles VII or Louis XI. by the sons of the royal house, so-called "princes of the blood" (princes du sang), who took precedence in due order after the king. To these were added, from the time of Louis XIV., the princes légitimés, recognized bastards of the sovereign, who ranked next after the princes of the blood. Thus, e.g. the princes of Condé, Conti and Lamballe owed their exalted precedence, not to their principalities, but to their royal descent.

In Germany, Austria and other countries formerly embraced in the Holy Roman Empire the title of "prince" has had a somewhat different history. During the first period of the empire, the "princes" were the whole body of the optimates who took rank next to the emperor. In the 11th century, with the growth of feudalism, all feudatories holding in chief of the Crown ranked as "princes," from dukes to简单册子, together with archbishops, bishops and the abbots of monasteries held directly of the emperor. Towards the end of the 12th century, however, the order of princes (Fürstenstand) was narrowed to the more spiritual and temporal feudatories who had a right to a seat in the diet of the empire in the "college of princes" (Fürstenbank). Finally, in the 13th century, seven of the most powerful of these separated themselves into a college which obtained the sole right of electing the emperor. These were called "prince electors" (Kurfürsten), and formed the highest rank of the German princes (see Elector).

The formal designation of "prince" (Fürst) was, however, extremely rare in Germany in the middle ages. Examples are the princes of Mecklenburg (Prillislav I., prince of the Holy Roman Empire in 1179) and Rügen, the latter title now belonging to the kings of Prussia. In the 17th century some half-dozen more principalities were created, of which that of Schwarzburg-Sondershausen (1697) survives as a sovereign house. The 18th century increased their number, and of the princely houses of this period those of Schwarzburg-Rudolstadt (1710), Waldeck (1712) and Reuss, elder branch (1778), have preserved their sovereignty. Of the other sovereign "princes" in Germany, Reuss, cadet branch, obtained the title in 1806, Schaumburg-Lippe in 1807. Outside the German Empire the prince of Liechtenstein, whose title dates from 1606, still remains sovereign.

Thus, in Germany, with the decay of the empire the title "prince" received a sovereign connotation, though it ranks, as in France, below that of "duke." There are, however, in the countries formerly embraced in the Holy Roman Empire other classes of "princes." Some of these inherit titles, sovereign under the old empire, but "mediatized" during the years of its collapse at the beginning of the 19th century, e.g. Thurn and Taxis (1695), Hohenlohe (1704), Leiningen (1779); others received the title of "prince" immediately before or after the end of the Roman Empire, e.g. Metternich-Winneburg (1803). Besides these mediatised princes, who transmit their titles and their privilege of "royal" blood to all their legitimate descendants, there are also in Austria and Germany "princes," created by the various German sovereigns, and some dating from the period of the old empire, who take a lower rank, as not being "princes of the Holy Roman Empire" nor entitled to any royal privileges. Some of these titles have been bestowed to give a recognized rank to the morganatic wives and children of royal princes, e.g., the princes of Battenberg, or the title of "princes" of Hohenberg borne by the consort of the Archduke Francis Ferdinand d’Este; others as a reward for distinguished service, e.g. Hardenberg, Blücher, Bismarck. In this latter case the rule of primogeniture has been usual, the younger sons taking the title of "count" (Graf). These non-royal princes are ranked in the Almanach de Gotha with British and French dukes and Italian princes. All these various classes of princes are styled Fürst and have the predicate "Serene Highness" (Durchlaucht). The word Prinz, actually styled "duke" in the 17th century, has continued as the title of the non-royal members of sovereign houses and, with certain exceptions (e.g. Bavaria), for the cadets of mediatised ducal and princely families. The heir to a throne is a "crown prince" (Kronprinz), "hereditary grand duke" (Erbgrossherzog) or "hereditary prince" (Erbprinz). The heir to the crown of Prussia, when not the son of the monarch has the title of "prince of Prussia" (Prinz von Preussen).

In Italy the title "prince" (principe) is also of very unequal value. In Naples, following the precedent set by Archibis., "much affecting the glory of a greater name than duke," it ranked above that of duke. In other parts of Italy the heads of great families sometimes bear the title of "prince," e.g. Prince Corsini, duke of Casigliano; sometimes that of "duke," e.g. the Caetani, princes of Teano, whose chief is styled "duke of Sermoneta," the title of "prince of Teano" being borne by his eldest son. The title of "prince of Naples" is attached to the eldest son of the king of Italy. The excessive multiplication of the title has tended to deprive it of much social value in itself, and under the democratic constitution of Italy it confers neither power nor precedence. "Prince" is also the translation of the Russian title knyaz, though sel'ky knyaz, the style of the Imperial princes, is rendered "grand duke." Some of the Russian, or Polish-Russian, princely families are of great importance—e.g. the Czartoryski, the Swiatopolcz-Czetwertynski, or the Russian

1 Fürst may or may not be a sovereign or territorial title, but it is only borne by the head of the family, e.g. Heinrich XIV., regierender Fürst (reigning prince) of Reuss or Fürst Bismarck. Prins always implies cadetship, e.g. Prins Heinrich XIV. of Reuss. The title Prinz von Preussen, therefore, excludes any idea of territorial sovereignty, whereas the correct German rendering of that of Prince of Wales, which originally at least implied such sovereignty, would be Fürst von Wales.
branch of the Lubomirskis. But, in general, though the title "prince" implies descent from one or other of the ruling dynasties of Russia, it is in itself little account, being exceedingly common owing to its being borne by every member of the family. The predicate of "Serene Highness," though borne by certain magnates who were princes before they became Russians—as in the case of the families mentioned above—is not attached to the Russian title of "prince." In some cases, however, it is conferred with the title by imperial warrant (e.g. Lieven, 1826).

The title of "prince" is also borne by the descendants of those Greek Phanariot families (see Phanariot), e.g. MAVROCORDATO, Turkey. Ypsilanti, Souza, who formerly supplied hospodars to the Turkish prinicpalities on the Danube. In the Ottoman Empire the rulers appointed to the quasi-independent Christian communities subject to it have usually been designated "prince," and the title has thus come to signify in connection with the Eastern Question a sovereignty not of legal or local subordinate. As such it was rejected on behalf of the Bavarian prince Otho, when he accepted the throne of Greece, in favour of that of "king." On the other hand, the substitution, in 1852, in Montenegro of the title of "prince and lord" (knyaz i gospodar) for the ancient title of vladika (archbishop) certainly implied no such subordination. The only other instance in Europe of "prince" as a completely sovereign title is that of the prince of Monaco, the formal style having been adopted by the Grimaldi lords in 1641.

In Great Britain "prince" and "princess" as titles are confined to members of the royal family, though non-royal dukes are so described in their formal style (see Duke). Great Britain. Nor is this use of great antiquity; the custom of giving the courtesy title of "prince" to all male descendants of the sovereign to the third and fourth generation being of modern growth and quite foreign to English traditions. It was not till the reign of Henry VII. that the king's sons began to be styled "princes"; and as late as the time of Charles II., the daughters of the duke of York, both of whom became queens regnant, were called simply the Lady Mary and the Lady Anne. The title of "princess royal," bestowed on the eldest daughter of the sovereign was borrowed by King George II. from Prussia. Until recent years the title "prince" was never conferred on anybody except the heir-apparent to the Crown, and his principality is a peerage. Since the reign of Edward III. the eldest sons of the kings and queens of England have always been dukes of Cornwall by birth, and, with a few exceptions, princes of Wales by creation. Before that Edward I. had conferred the principality on his eldest son, afterwards Edward II., who was summoned a prince and sat in parliament as prince of Wales. But Edward the Black Prince was the original grantee of the principality as well as of the dukedom, under the special limitations which have continued in force to the present day. The entail of the former was "to him and his heirs the kings of England" and of the latter "to him and his heirs the first-begotten sons of the kings of England." Hence when a prince of Wales and duke of Cornwall succeeds to the throne the principality in all cases merges at once in the Crown, and can have no separate existence again except under a fresh creation, while the dukedom, if he has a son, descends immediately to him, or remains in abeyance until he has a son if one is not already born. If, however, a prince of Wales and duke of Cornwall should die in the lifetime of the sovereign, leaving a son and heir, both dignities are extinguished, because his son, although he is his heir, is neither a king of England nor the first-begotten son of a king of England. But, if instead of a son he should leave a brother his heir, then, as decided in the reign of James I. on the death of Henry, prince of Wales, whose heir was his brother Charles, duke of York—the dukedom of Cornwall would pass to him as the first-begotten son of the king of England then alive, the principality of Wales alone becoming merged in the Crown. It has thus occasionally happened that the dukes of Cornwall have not been princes of Wales, as Henry VI. and Edward VI., and that the princes of Wales have not been duked of Cornwall, as Richard II. and Edward III. But even now the cadets of the reigning family can only by royal intervention legally be saved from merging, as of old, in the general untitled mass of the people. The children of the sovereign other than his eldest son, though by courtesy "princes" and "princesses," need a royal warrant to raise them de jure above the common herd; and even then, though they be dubbed "Royals" in their cradles, they remain "commoners" till raised to the peerage. In 1905 King Edward VII. established what appears to be a new precedent, by conferring the titles of "princess" and "highness" upon the daughters of the princess Louise, Duchess of Fife, created "princess royal."

This use of the word "prince"—which has in England so lofty a connotation—to translate foreign titles of such varying importance and significance naturally leads to a good deal of confusion in the public mind. It is not uncommon in English society to see, e.g. a Russian prince, who may be only the cadet of a family not included in the Almanach de Gotha, given precedence as such over the untitled members of a great English ducal family, and treated with some of that exaggerated deference paid to "royalty." On the other hand, the insular complacency of many Englishmen is apt to regard all German princes with a certain contempt, whereas the title is in Germany sometimes associated with sovereign power, sometimes with vast territorial possessions, and always with high social position.

See, Du Cange, Glossarium, s.v. "princeps," ed. G. A. L. Henschel (Niort, 1883); J. John Selden, Titles of Honour (London, 1672); Annales de la reine (1700); H. Schuhbe, Die Hausgesetze der regierenden deutschen Fürstenhäuser (3 vols., Jena, 1803-1805); H. Rehm, Modernes Fürstenrecht (Munich, 1904).

PRINCE EDWARD ISLAND, a province of the Dominion of Canada, lies between 45° 58' and 49° 7' N. and 62° and 64° 27' W. The underlying geographical formation is Permian, though outliers of Triassic rock occur. The coal seams supposed to underlie the Permian formation are apparently too deep down to be of practical value. The rocks consist of soft red micaceous sandstone and shales, with interstratified but irregular beds of brownish-red conglomerates containing pebbles of white quartz and other rocks. There are also beds of hard dark-red sandstone with the shales. Bands of moderately hard reddish-brown conglomerate, the pebbles being of red shale and containing white calcite, are seen at many points; and then greenish-grey irregular patches occur in the red beds, due to the bleaching out of the red colours by the action of the organic matter of plants. Fossil plants are abundant at many places. Beds of peat, dunes of drifted sand, alluvial clays and mussel mud occur in and near the creeks and bays.

Physical Features.—The island lies in a great semi-circular bay of the Gulf of St. Lawrence, which extends from Point Miscou in New Brunswick to Cape North in Cape Breton. From the mainland it is separated by Northumberland Strait, which varies from 9 to 30 miles in width. It is extremely irregular in shape, and deep inlets and tidal streams almost divide it into three approximately equal parts; from the head of Hillsborough river on the south to Savage Harbour on the north is only one and a half miles, while at high tide the distance between the heads of the streams which fall into Bedeque and Richmond Bays is even less. North of Summerside the land nowhere rises more than 175 ft. above sea-level; but between Summerside and Charlottetown, especially near north Wiltshire, is a ridge of hills, running from north to south and rising to a height of nearly 500 ft. From Charlottetown eastwards the land is low and level. The north shore facing the gulf, is a long series of beaches of fine sand, and is a favourite resort in summer. On the south, low cliffs of crumbling red sandstone face the strait. The climate is healthy, and though bracing, milder than that of the neighbouring mainland. Fogs are much less common than in either New Brunswick or Nova Scotia.

Area and Population.—The greatest length of the island is 145 m., its greatest breadth 34 m., its total area 2184 sq. m.
The population in 1901 was 103,239, having sunk from 109,078 in 1891. It is thus much the most densely populated province in Canada, there being nearly fifty-two persons to the sq. m. Though very large families are not so common as in the province of Quebec, the agricultural character of the population makes the average number of persons to a family greater (5·51) than in any other province. As in all the maritime provinces, there is a steady immigration to the Canadian West and to the United States. The population is mainly of British descent, but also comprises descendants of the French Acadians and of the American loyalists. About 200 Indians of the Mic-Mac tribe remain, and have slightly increased in numbers since 1891. In 1901 the origin of the people was: Scots, 41,753; English, 24,043; Irish, 21,992; French, 13,860; all other nationalities, 1,904. The principal religious denominations and the number of their adherents were as follows: Church of Rome, 4,758; Presbyterians, 30,753; Methodists, 13,402; Anglican, 3,976; Baptists, 5,905. The Irish and French are almost entirely Roman Catholic, the Scots about two-thirds Presbyterian and one-third Roman Catholic. Jurisdiction over the Catholics is held by the bishop of Charlottetown, and over the Anglicans by the bishop of Nova Scotia. The Presbyterians form part of the synod of the Maritime Provinces.

Administration, &c.—Five members of the House of Commons and four senators are sent to the federal legislature. At its entrance into federation in 1873, the number of members was six, and the reduction to five in 1901 was bitternly denounced. The local government now consists of a lieutenant-governor and of a legislative assembly. This conducts not only the general affairs of the province, but most of those of the towns and villages; legal provision has, however, been made for the establishment of a municipal system, and Charlottetown and Summerside are incorporated municipalities, though with powers of self-government much more limited than those of any other incorporated Canadian towns. The provincial revenues, which tend to prove inadequate, are being made up by the subsidy paid by the federal government; though there are numerous taxes, which bear heavily on the small industrial population. But for the increase in 1907 of the federal subsidy, financial exigencies might have forced the adoption of direct taxation, in spite of its unpopularity among the farmers.

Education.—Primary education in the province has been given free since 1852. Since 1877 it has been under the control of a minister of education with a seat in the provincial cabinet. At Charlottetown is the Prince of Wales College, really a rather advanced secondary school, with which is affiliated the Normal School. St Dunstan’s College, another advanced high school in Charlottetown, is under Roman Catholic control. Advanced university education is not given in the province. Attendance at the primary schools is by law compulsory, but the exigencies of a farming population and the lack of adequate means of enforcement render the law inoperative. The salaries of the teachers are, as a rule, low; and the school buildings cheerless and ill-maintained.

Agriculture.—The soil, an open sandy loam, deep red in colour, which was slightly exhausted at the beginning of the century by repeated crops of cereals, has been renewed by the application of mussel mud dredged from the bays and tidal streams. All the staple crops are grown—especially oats, potatoes and turnips. Wheat is raised only for local consumption. Cattle and hogs flourish. In the last twenty years the introduction of co-operation gave a great impetus to the manufacture of butter and cheese. The first cheese factory was opened in 1893, and the first creamery in 1894. Of over 15,000 farmers all, save about 900, own their own farms, and are in nearly all cases well-to-do. Large quantities of animal and vegetable food, amounting to about one-half of the total product, are exported, chiefly to Cape Breton, Newfoundland, and the New England states. Fruit is raised less extensively than in Nova Scotia, but enough is grown to supply the local market, and apples of good quality are exported.

Fisheries.—Though smaller in value than those of any other sea-board province, the fisheries of Prince Edward Island are, in proportion to the total population, extremely productive. Of the catch of about £200,000, lobsters, most of which are canned, are worth about £50,000, and oysters £20,000, in the latter case about half the total value of the catch of the Dominion, which is compelled to import largely from the United States. There are signs of the approaching exhaustion of the oyster beds, but no adequate remedy or new source of supply has been found. Herring, cod, mackerel and smelts are also caught in large quantities in the coast waters.

Other Industries.—About one-third of the province is covered with birch, beech, maple, pine, spruce, cedar and other woods, but though a little lumber is exported, the industry is declining. The building of wooden ships, a flourishing trade till about 1886, is now almost extinct. The packing of pork and of lobsters is actively pursued near Charlottetown, and small factories have been established for the manufacture of boots and shoes, tobacco, condensed milk, &c., but the great bulk of the manufactured goods used are imported from the other provinces.

Communications.—The Prince Edward Island branch of the Intercolonial railway, owned and worked by the federal government, runs from Souris in the east to Tignish in the north-west, with branches to Georgetown, Murray Harbour, Charlottetown and Cape Traverse. Good wagon roads intersect each other everywhere, and nearly all the villages and country districts are connected by telegraph. During spring, summer and autumn Charlottetown has daily communication with Pictou in Nova Scotia and Shediac in New Brunswick, and a frequent service to other ports in Nova Scotia, Newfoundland and Massachusetts. The harbour of Charlottetown and the Northumberland Straits are closed by ice from about the middle of December to the beginning of April, after which there is a service by specially constructed ice-breaking boats between Georgetown and Pictou. The ice is often too thick to make a regular service possible, and the island has long agitated for federal construction of a railway tunnel between Cape Traverse in Prince Edward Island and the neighbouring shore of New Brunswick, 9 m. distant.

History.—Jacques Cartier sighted Prince Edward Island on his first voyage in June 1534, but mistook it for part of the mainland. Succeeding voyagers discovered his mistake, and toward the end of the 16th century it was called Isle St Jean, which name it retained till 1798, when it was given its present name out of compliment to the duke of Kent, at that time commanding the British forces in North America. In 1603 Champlain took possession of it for France, and in 1663 it was granted by the company of New France to Captain Douhet, an officer in the navy whose failure to make permanent settlements soon brought about the loss of his grant. Little attention was paid to the island until the peace of Utrecht, when the French made efforts to colonize it. In 1710 it was granted, en franco allea noble, to the count of St Pierre, who tried to establish fisheries and a trading company. He spent large sums on his enterprise, but the scheme proved unsuccessful and his grant was revoked. In 1758, soon after the capture of Louisbourg, Isle St Jean was occupied by a British force under Lord Rollo (see Annual Register, 1758). Its population at this time numbered about 4000, under a military governor with his headquarters at Port la Joie (Charlottetown). After its final cession to Great Britain in 1763 it was placed under the administration of Nova Scotia, but later was made a separate government, its first parliament meeting in 1773.

In 1764–1765 it was surveyed, and most of the present names given; in 1767 it was divided into townships of about 20,000 acres each, grants of which were made to individuals with claims on the government. They were to pay a small sum as quit rents, and the conditions imposed provided for the establishment of churches and wharves and bona-fide settlement. On these terms practically the whole island was granted away in a single day. The grantees were in most cases mere speculators, and the lands fell into the hands of a large number of non-residents. A continual agitation against the absentee was kept up by the settlers, who rapidly increased in numbers. During the early
10th century many Scottish immigrants settled in the island. A commission appointed in 1800 advised the compulsory purchase of the lands, and their sale in smaller holdings to genuine settlers, but a bill passed with this intent was disallowed by the imperial authorities. In 1864 a conference to consider the question of maritime union met at Charlottetown. The visit of delegates from Canada widened it into a general conference on federation, from which sprang the Dominion of Canada. Prince Edward Island's local patriotism forced its representatives to withdraw from the later conferences, but the abrogation in 1866 by the United States of the Reciprocity Treaty of 1854, financial difficulties connected with the building of an island railway, and the offer of better terms by the Dominion government, brought it into federation in 1873. A bill on the lines of that formerly disallowed was soon afterwards passed, and the land difficulty was finally settled. Since then the main political issues have been the quarrel with the federal government over the construction of a tunnel and the control of the liquor traffic, which has been prohibited but by no means suppressed.

**PRINCIPAL ISLANDS** (anc. Demoni; Byzantine, Papadonisia; Turkish, Kizil Adalar, or "Red Islands," from the reddish colour of the rocks), a cluster of nine islands in the Sea of Marmora, forming a caza of Constantinople. They figure in Byzantine history chiefly as places of banishment. A convent in Prinkipo (now a mass of ruins at the spot called Kamares) was a place of exile for the empress Irene, Euphrosyne, Zoe, and Anna Dalassena. Antigone was the prison of the patriarch Methodius, and its chapel is said to have been built by the empress Theodora. In Khalki the monastery of the Theotokos (originally of St. John), which since 1831 has been a Greek commercial school, was probably founded by John VI. or VII. Palaeologus, was rebuilt about 1680, and again in the 18th century by Alexander Ypsilanti, hospodar of Moldavia. Close beside it is the tomb of Edward Barton, second English ambassador to the Porte. Hagia Trias (a school of theology since 1844) was rebuilt by the patriarch Metropolitans. On Prot there were the monasteries to which Bardanes (Philippicus), Michael I. Rangabes, Romanus I., Lecapenus and Romanus IV. Diogenes were banished. The islands are a favourite summer resort; four are inhabited and noted for the mildness and salubrity of their climate. Prinkipo (Plyusa), altitude 655 ft.; Khalki (Cholhia), 592 ft.; and Principo (Panormus); Turkish Burgaz Adasi, 500 ft. The buildings on all the islands were injured by the earthquake of 1894, especially the naval college, and monastery of St. George on Khalki, and the monastery of Christ on Prinkipo. The population is about 10,500, half being Greek. Khalki contains an Ottoman naval school and Greek theological and commercial colleges.

**PRINCETON,** a city and the county-seat of Gibson county, Indiana, U.S.A., about 27 m. N. of Evansville. Pop. (1900), 6041. 626 being of negro descent and 1508 foreign-born; (1910) 6443. It is served by the Evansville & Terre Haute and the Southern railways (the latter of which has shops here), and by the Indiana Central. It is a station on the Illinois Central, which has a considerable trade in oil and coal, and in the agricultural products of the surrounding region, and has various manufactures. Princeton was first settled in 1814, and was chartered as a city in 1884.

**PRINCETON,** a borough of Mercer county, New Jersey, on Stony Brook, and the Delaware & Raritan canal, 49 m. S.W. of New York City. Pop. (1905) 6029; (1910) 5136. Princeton is served by the Pennsylvania railroad, and by two electric lines to Trenton (10 m.), passing through Lawrenceville (in Lawrence township; until 1816 called Maidenhead; pop., 2522 in 1910), the seat of the Lawrenceville school (1882), for boys, which was endowed by the residuary legates of John Cleve Green (1800–1875), and is probably the first endowed secondary school for boys in the Middle States.

Princeton is situated 210 ft. above sea-level, and the county to the east, north and west is rocky and hilly. The borough is the seat of Princeton University (q.v.), and of "The Theological Seminary of the Presbyterian Church in the United States of America," commonly known as Princeton Theological Seminary, which was opened in 1812, and was chartered in 1824. The seminary was for one year under the sole care of Archibald Alexander (q.v.), and among its teachers and representative theologians have been Samuel Miller (1769–1850), who was professor of ecclesiastical history and church government here (1843–1849), Charles Hodge, Joseph Addison Alexander and Waddell Alexander, William Henry Green, Archibald Alexander Hodge, Francis L. Patton, who became president in 1902 and Benjamin W. Warfield (b. 1851), professor of didactic and polemic theology from 1887. Under such leaders Princeton theology has been distinctly conservative, supporting the old standpoints of the Westminster Confession and Catechisms. The seminary is well endowed, so that there is no charge for tuition or room rent; among its principal benefactors were James Lenox (1800–1880), Robert Leighton Stuart (1806–1882), his widow and his brother Alexander (1810–1879), John Cleve Green, mentioned above, and Mrs Mary J. Winthrop (d. 1902). It has a fine campus south-west of the business centre of the borough; in the Lenox Library and the Lenox Reference Library, built in 1843 and 1879 respectively, and gifts of James Lenox, there were 51,000 bound volumes and 31,500 pamphlets in 1909; Stuart Hall (1876) contains lecture-rooms; Miller Chapel is the place of worship; and the three dormitories are Alexander Hall (the "Old Seminary"), first used for this purpose in 1817, Brown Hall, built in 1864–1865, and Hodge Hall (1893). In 1908–1909 the faculty numbered 16 and the students 153, of whom 8 were fellows and 17 graduate students.

Princeton became in 1897 the home of Grover Cleveland, who died there; and from 1898 until his death it was the residence of Laurence Hutton (1843–1904), a well-known writer on the history of the stage. Besides its fine residences and buildings of the seminary and of the university, the only notable buildings are the handsome Princeton Inn, about midway between the campus of the university and that of the seminary, and "Morven," the homestead of the Stocktons, built in the first decade of the 19th century. In the Princeton Cemetery are buried presidents and professors of the university.

The first settlers were the companions of Richard Stockton, the grandfather of Richard Stockton, signer of the Declaration of Independence. The removal hither in 1736 from Newark of the College of New Jersey, later Princeton University, gave the place its first educational prominence. At the time of the War of Independence town and gown were both strongly patriotic. The first state legislature of New Jersey met here on the 27th of August 1776; and in Nassau Hall, the first of the college buildings, erected in 1754–1756, which was then the largest edifice in the colonies, the Continental Congress sat from the 30th of June to the 4th of November 1783, and on the 31st of October Congress received the news of the signature of the definitive treaty of peace with Great Britain. After the battle of Trenton Cornwallis's troops were hurried to that place, three regiments and three companies, to meet the attack of the Continental army through the height of January 1777, passed through. Washington, unable to retreat or to meet the British attack, turned Cornwallis's left flank and advanced on the weak garrison at Princeton. On the 3rd a force under Gen. Hugh Mercer (c. 1720–1777), ordered to destroy the Stony Brook bridge, and so cut off escape to Trenton, met two of the three regiments, led by Lieut.-Colonel Charles Mawhood, near the bridge, and, though doing great execution with its rifles at a distance, was unable, being unequipped with bayonets, to hold its ground.
In hand-to-hand fighting, and fled through an orchard, leaving Mercer there mortally wounded; he died on the 12th in a farmhouse (still standing) on the battlefield. Washington’s main army now came to the assistance of the retreating Americans, and forced the retreat of the other British regiments (the 55th and 40th) to Princeton, where they either surrendered or fled towards New Brunswick. The British losses were heavy and the Americans lost many officers. The bridge was destroyed by the American troops just before the approach of General Alexander Leslie (c. 1740–1794) with reinforcements from Cornwallis. Washington’s flank movement at Trenton and his engagement with the British at Princeton made necessary the withdrawal of the British from West Jersey. In the autumn of 1783 Washington, summoned to Princeton by Congress, then in session there, made his headquarters at Rocky Hill, about 4 m. north of Princeton in Montgomery township, Somerset county, whence on the 2nd of November he issued his farewell address to the army; his headquarters is preserved as a museum.

A battle monument in Princeton, designed by MacMonnies and paid for by the Federal Congress, the state of New Jersey and the borough of Princeton, has been projected.

PRINCETON UNIVERSITY, an American institution of higher learning in Princeton, New Jersey, until 1869 called officially the college of New Jersey. Its campus consists of 539 acres comprised in three tracts of ground adjoining each other. The main campus, one of the most beautiful in the country, is on the south side of Nassau Street, the old country road between Philadelphia and New York, and is principally contained in a block of about 225 acres, which on its west side has an almost continuous row of English collegiate Gothic buildings: Blair Hall, Stafford Little Hall, and the gymnasium.

Nassau Hall, which was built in 1756, nearly destroyed by fire in 1802, rebuilt in 1804, and damaged by fire in 1855, is a squarely built edifice in the Georgian style. Originally housing the whole college, it is familiarly known as North College, in a quadrangle arrangement of which West College, built in 1836, is the only other remainder; the south side having been occupied since 1838 by Clio Hall and Whig Hall, the homes of the two literary societies, founded respectively in 1765 and 1769, and since 1831 housed in white marble buildings of classical type; and East College, having given place to the main building of the University Library (1897), in Gothic Longmeadow stone, the gift of Mrs Percy Rivington Pyne. Besides West College, the dormitories are Reunion Hall (1870), commemorating the reconciliation of the Old and New schools of the Presbyterian Church; University Hall (1870), formerly an hotel and now housing on its lower floor the university dining halls for all freshmen and sophomores; Witherspoon Hall (1879), in Victorian Gothic of grey stone trimmed with brown; Edwards Hall (1880), a brown stone Gothic building; Albert B. Dod Hall (1890), a granite limestone-trimmed Italian building; David Brown Hall (1891), granite and Pompeian brick, in Florentine Renaissance; the Pyne Buildings (1896) in half-timbered Chester style; Blair Hall (1897), built in English Collegiate Gothic of white Germantown stone, on the south-western margin of the campus; the Stafford Little Hall (1899 and 1901), in the same style as Blair Hall, and joining it on the south; Seventy-nine Hall (1904), the class hall of 1879, another Tudor Gothic building of red brick trimmed with Indiana limestone; and Patton Hall (1906); Campbell Hall (1906); the gift of the class of 1877; and a new group of buildings, chiefly dormitories, occupying the entire north-west corner of the main campus, fronting on Nassau and University Place, three sections of which (the gift of Mrs Russell Sage) were completed in 1910. These buildings are in the same architectural style and of the same materials as Blair and Little Halls. There is accommodation for about 90% of the undergraduates of the university in the campus dormitories, including the new buildings.

The recitation halls are: Dickinson (1879; remodelled in 1876) and McCosh Hall (1907), for the academic department; and the school of science building (1873), a gift of John C. Green, on the north-east corner of the main block of the campus. The Halsted Observatory (1886) and the Observatory of Instruction (1878) are well known for their work done in them by the astronomer Charles Augustus Young (1834–1908); among the laboratories are the biological (1887), the chemical (1891), the civil engineering (1904), the Palmer physical (1908), and, for natural science, Guyot Hall (1909), which also houses the natural science museum, including valuable fossils. There is a museum of historic art (1887) which includes the finds of the Princeton archaeological expedition to Syria, and in Nassau Hall there is a psychological laboratory. There are two auditoriums, the Marquand chapel (1881), the gift of Henry G. Marquand, and Alexander Hall (1892), used for commencement exercises. Also on the campus are the dean’s house (1750), until 1878 the president’s residence; Prospect (1849), bought by the college in 1878, which is the president’s residence; the university offices (1903); and Dodge Hall (1900) and Murray Hall (1879), which are the home of the college Y.M.C.A., the Philadephian Society, founded in 1825.

The university library is housed in a large building already described, built (1866) on to the Chancellor Green library building (1872), given by John C. Green in memory of his brother Henry Woodhull Green, chancellor of the state of New Jersey, and now the reading room and reference library. In 1910 the library had a collection of 257,800 volumes and about 58,000 unbound pamphlets. There are two athletic fields: one, the university, two blocks east of the main campus, and the other, the Brokaw field, in the south-west corner of the main campus; immediately north of the latter are the Brokaw Memorial gateway and building (1892), with a swimming pool, and the alternate gymnasium (1903). South-east of the Campus is Lake Carnegie, an artificial widening of Millstone River, the gift of Andrew Carnegie; it is used for boating.

A notable feature of the university is its upper-class club-houses. The upper-class clubs have in the social life of Princeton, somewhat the place of the Greek letter societies elsewhere. There are no fraternities at Princeton; each entering student pledges himself to the “Princeton connection” which promises to make him a member of the society, and if he wishes to do so, there is admitted the right to attend the meetings of any secret society "so long as he is a member of the university, "it being understood that this promise has no reference to the American Whig and Lysicrates Societies. These two societies, the object of which is particularly to cultivate skill in debate and public speaking, are affiliated with the English department of the faculty.

A peculiarity of the university is its system of student government, which is marketed on "the system " in examinations and written recitations, under which every student has a pass on his paper that he has "neither given nor received assistance," and in which there is no faculty or ministerial watch over students. The system is administered by a student committee, to which any dishonesty in examinations is to be reported, and which then investigates the charge, and if it finds it true reports the offender to the faculty for dismissal.

The university curriculum included an academic department, leading to the degree of B.A. or Litt. B.; the John C. Green school of science (1873), offering courses leading to the degree of B.S. and C.E.; a school of electrical engineering; and a graduate department, having with it a degree of the same name, for candidates for the B.S. degree, and those who concentrate in other departments during the last year of graduate work. The entrance requirements are largely in accordance with the recommendations of the National Education Association and the college entrance examination board; students entering the academic department of the university are required to possess two years of college work and the degree of A.B.; students (not offering Greek for entrance) who concentrate in mathematics or science in junior and senior year are candidates for the B.S. degree, and those who concentrate in other departments during the last year of graduate work are required to possess the B.S. or the Litt. B. degree are the same, and they differ from those for the A.B. degree (and agree with those for the C.E. degree) in including more mathematics, i.e., solid geometry and plane trigonometry. The school of electrical engineering awards the degree of B.S. degree (1914) in electrical engineering, and the graduate and professional in its scope. The graduate school (1871) has been slightly developed, and this development has been almost entirely since 1900; a bequest of more than $300,000 in 1906 provided for the John R. Thomson Graduate College and the estate of Isaac Chauncey Wyman (d. 1910), of the class of 1849, valued at about
$3,000,000 was left to the university for the establishment of the graduate school.

A notable feature of the scheme of instruction is the preceptorial (or tutorial) system, introduced in 1905; it somewhat resembles Jowett’s course, faculty politics, and the Princeton College system; the preceptorial method is a self-perpetuating body, two ex officio trustees, and (since 1900) five alumni trustees, elected by the graduates of the university for a five-year term, one each year.

The tuition fee is $150 a year in all undergraduate courses. There are many scholarships and prizes, a fund for the remission of tuition to students of insufficient means, and funds for the assistance of students for the ministry. In July 1900 the assets of the university were $3,410,907, of which $3,322,445 were endowment. The largest of the endowment $3,410,907 was special, $330,445 general, $60,000 historical, $122,643 was for scholarships and $24,490 was for professorships. In this fiscal year the gifts for current expenses and special purposes amounted to $129,294 and the gifts for endowment to $1,598,828.

The university owes its origin to a movement set on foot by the Synod of Philadelphia in 1739 to establish in the Middle Colonies a college to rank with Harvard and Yale in New England and William and Mary in Virginia. Owing to dissension in the church, no progress was made until 1746, when the plan was again broached by the Synod of New York, recently formed by the secession of the presbytery of New York from the presbytery of New Brunswick, radical (New School) presbyteries of the Synod of Philadelphia. The Synod of New York was led by Ebenezer Pemberton (1704-1779), a graduate of Harvard (1721), and Jonathan Dickinson (1688-1747), a graduate of Yale (1706). Together they had attempted to make peace between the conservatism of the presbytery of Philadelphia and the radicalism of the presbytery of New Brunswick. Most of the leaders of the presbytery of New Brunswick had been educated at the Log College, a school with restricted curriculum, situated about 20 m. N.E. of Philadelphia, but recently closed. The students of the Log College were almost without exception preparing for the Presbyterian ministry, and on the closing of the Log College, the opportunity was taken by the Synod of New Brunswick to found a larger and better institution of higher learning, broader in scope and training, $60,000 having been subscribed to a new project the Log College interests. On October 22nd 1746, John Hamilton, acting governor of New Jersey, granted a charter for erecting a college in New Jersey. The college of New Jersey was opened in May 1747 at Elizabeth, New Jersey, with the Rev. Jonathan Dickinson as president. Little was accomplished until 1748, when, on the 14th of September, a second charter was granted to the “trustees of the College of New Jersey,” thirteen in number. The college under the administration of Jonathan Dickinson, held its exercises from the last of May 1747 to the 7th of October 1747, when Dickinson died. Upon the succession of Aaron Burr to the presidency, the school removed to Newark, where the first commencement was held in 1748 and where Burr began the work of organizing the college and its curriculum; but the situation was unsuitable, and in 1752 the trustees voted to remove the college to Princeton, where land was given for the Campus by Nathaniel Fitz Randolph. While funds were being raised for the college, work was begun in Princeton in 1754 on the first college buildings, which, at Governor Belcher’s request, was named Nassau Hall, in honour of King William. A year after the completion of this single college building and the removal of the students to Princeton, Burr died and was succeeded by his father-in-law, Jonathan Edwards, who died after five weeks in office (1758). He was succeeded (1759-1761) by Samuel Davies, and Davies (1761-1766) by Samuel Finley (1766-1769). John Witherspoon (q.v.) was president from 1768 until his death in 1794, and more than any of his predecessors influenced the college. The presidents immediately succeeding Witherspoon were: his son-in-law, Samuel Stanhope Smith (1750-1810), who resigned in 1812; Ashbel Green (1762-1848), who resigned in 1822; James Carnahan (1775-1839), who held office for thirty-one years (1823-1854), and in whose presidency there was, in 1840-1852, a department of law in the college; and John Maclean (1800-1866), who was president from 1854 to 1868. Up to the outbreak of the Civil War, the college was largely attended by Southerners, and the Civil War thus dealt it a doubly heavy blow, from which it began to recover under the long presidency (1865-1888) of James McCosh, who, like his successor, Francis Landey Patton (q.v.), president from 1888 to 1902, greatly advanced the material scheme of the college. Fourteen new buildings were erected during Dr McCosh’s administration, and the John C. Green Science School of Science was established in 1873 by the gift of John Cleve Green; and during Dr Patton’s administration the enrollment of students more than doubled, as did the number of members of the faculty. In October 1896, on the 150th anniversary of its founding, the official name of the College of New Jersey, long popularly displaced by Princeton, was dropped, and the corporation became “The Trustees of Princeton University,” although the institution did not become, in the usual American use of the term, a university, having no professional schools whatever, and only a small postgraduate department. On Dr Patton’s resignation in 1902 he was succeeded by Woodrow Wilson (q.v.), the first layman to become president, who introduced the preceptorial system already described.

**PRINCIPAL**

**PRINCIPAL AND AGENT**

In law an agent is a person authorized to do some act or acts in the name of another, who is called his principal. The law regulating the relations of principal and agent has its origin in the law of mandate among the Romans, and in England the spirit of that system of jurisprudence pervades this branch of the law. The law of agency is thus almost alike throughout the whole British Empire, and a branch of the British commercial code, in which it is of great importance that different nations should understand each other’s system, differs only slightly from the law of the rest of Europe.

In a general view of the law of agency it is necessary to have regard to the rights and duties of the principal, the agent, and the public. The agent should not do what he has no authority...
for; yet if he be seen to have authority, those with whom he deals should not be injured by secret and unusual conditions. The employer is bound by what his agent does in his name, but the public are not entitled to take advantage of obligations which are known to be unauthorized and unusual. The agent is entitled to demand performance by the principal of the obligations undertaken by him within the bounds of his commission, but he is not entitled to pledge him with a recklessness which he would certainly avoid in the management of his own affairs.

It is in the regulation of these powers and corresponding checks in such a manner that the legal principle shall apply to daily practice, that the niceties of this branch of the law consist.

Agents are of different kinds, according to their stipulated or consuetudinary powers. The main restraint in the possible powers of an agent is in the old maxim, 

*delegatus non potest delegare*, designed to check the complexity that might be created by inquiries into repeatedly-deputed responsibility. The agent cannot delegate his commission or put another in his place; but in practice this principle is sometimes modified, for it so may arise from the nature of his office that he is to employ other persons for the accomplishment of certain objects. Thus, there is nothing to prevent a commercial agent from sending a portion of the goods entrusted by him to his own agent for disposal.

In the general case agency is constituted by the acceptance of the mandate or authority to act for the principal, and the evidence of this may be either verbal or in writing. The English statute of frauds requires an agent to have authority in writing for the purposes of its 1st, 2nd and 3rd clauses relating to leases. “And it is a general rule, that an agent who has to execute a deed, or to take or give livery or seisin, must be appointed by deed for that purpose. Moreover, as a corporation aggregate can in general act only by deed, its agent must be so appointed, though it would seem that some tripling agencies, even for corporations, may be appointed without one” (see *Mercurial Law*, B. I. ch. iv.). It is a general rule that those obligations which can only be undertaken by solemn formalities cannot be entered on by a delegate who has not received his authority in writing. But it is often constituted, at the same time that its extent is defined, by mere appointment to some known and recognised function—as where one is appointed agent for a banking establishment, factor for a merchant, broker, supercargo, traveller, or attorney. In these cases, usage defines the powers granted to the agent; and the employer will not readily be subjected to obligations going beyond the usual functions of the office; nor will the public dealing with the agent be bound by private instructions inconsistent with its usual character. While, however, the public, ignorant of such secret limitations, are not bound to respect them, the agent himself is liable for the consequences of transgressing them. Agency may also be either created or enlarged by implication. What the agent has done with his principal’s consent the public are justified in believing him authorized to continue doing. Thus, as a familiar instance, the servant who has continued to purchase goods for his master at a particular shop on credit is presumed to retain authority and trust, and pledges his master’s credit in further purchases, though he should, without the knowledge of the shopkeeper, apply the articles to his own uses. The law is ever jealous in admitting as accessories of a general appointment to any particular agency the power to borrow money in the principal’s name, to give his name to bill transactions, and to pledge him to guarantees; but all these acts may be authorized by implication, or by being the continuation of a series of transactions, of the same kind and in the same line of business, to which the principal has given his sanction. Thus an employer may, by the previous conduct of its operations, be liable for the bills or notes drawn, indorsed and accepted by another mandant, or by other mandant; may, be responsible for the obligations thus incurred after the mandant’s dismissal, if the party dealing with him knew that he was countenanced in such transactions, and had no reason to suppose that he was dismissed. In questions of this kind the distinction between a general and a special agent is important. A general agent is employed to transact all his principal’s business of a particular kind, at a certain place—as a factor to buy and sell, a broker, to negotiate contracts of a particular kind; an attorney to transact his legal business; a shipmaster to do all things relating to the employment of a ship. Such an agent’s power to do everything usual in the line of business in which he is employed is not limited by any private restriction or order unknown to the party with whom he is dealing. On the contrary, it is incumbent on the party dealing with a particular agent, i.e. one specially employed in a single transaction, to ascertain the extent of his authority. The law applicable to a mercantile agent’s power to pledge or otherwise dispose of the goods entrusted to him being in an unsatisfactory state, a statutory remedial was applied to it by an act of 1825 (6 Geo. IV. c. 94), amended in 1842 (5 & 6 Vict. c. 39) and replaced by the Factors Act 1880.

The obligations of the principal are: to pay the agent’s remuneration, or, as it is often called, *commission*, the amount of which is fixed by contract or the usage of trade; to pay all advances made by the agent in the regular course of his employment; and to honour the obligations lawfully undertaken for him. The agent is responsible for the possession of the proper skill and means for carrying out the functions which he undertakes. He must devote to the interests of his employer such care and attention as a man of ordinary prudence bestows on his own—a duty capable of no more certain definition, the application of it as a fixed rule being the function of a jury. He is bound to observe the strictest good faith; and the law even interposes to remove him from temptation to sacrifice his employer’s interests to his own (see *Commission: Secret*). Thus, when he is employed to buy, he must not be the seller. When an agent is employed to sell, he must not be the purchaser. He ought only to deal with persons in good credit, but he is not responsible for their absolute solvency unless he guarantee them. A mercantile agent guaranteeing the payments he treats for is said to hold a *de iure com- mission*.

**PRINGLE, SIR JOHN** (1707-1782), British physician, was the younger son of Sir John Pringle, of Stitchel, Roxburghshire, and was born on the 10th of April 1707. He was educated at St Andrews, at Edinburgh, and at Leiden. He took the degree of doctor of physic at the last-named university, where he was an intimate friend of G. van Swieten and A. von Haller. He settled in Edinburgh at first as a physician, but after 1734 also acted as professor of moral philosophy in the university. In 1742 he became physician to the Earl of Stair, then commanding the British army in Flanders, and in 1744 was appointed by the Duke of Cumberland physician-general to the forces in the Low Countries. In 1749, having settled in London, he was made physician in ordinary to the Duke of Cumberland; and in 1752 he married a daughter of Dr William Oliver (1695-1704) of Bath, the inventor of “Bath Oliver” biscuits. Subsequently he received other court appointments as physician, and in 1766 was made a baronet. His first book, *Observations on the Nature and Cure of Hospital and Jayl Poisons*, was published in 1750, and in the same year he contributed to the *Philosophical Transactions of the Royal Society* three papers on “Experiments on Septic and Antiseptic Substances,” which gained him the Copley medal. Two years later he published his important work, *Observations on the Diseases of the Army in Camp and Garrison*, which entitles him to be regarded as the founder of modern military medicine. In November 1772 he was elected President of the Royal Society. In this capacity he delivered a “Discourse,” which were afterwards collected into a single volume (1783). After passing his seventieth year he resigned his presidency and removed to Edinburgh in 1780, but returned to London in September 1781, and died on the 18th of January following. There is a monument to him in Westminster Abbey, executed by Nollekens.
A Life of Pringle by Andrew Kippis is prefixed to the volume containing the Six Discourses. The library of the College of Physicians of Edinburgh possesses tenfolio volumes of his unedited MSS., including an essay "On Air, Climate, Diet and Exercise." There are Elogia in him by Vicq d'Azay and Condorcet.

PRINGSHEIM, NATHANIEL (1823-1894), German botanist, was born at Wiesko in Silesia, on the 30th of November 1823. He studied at the universities of Breslau, Leipzig, and Berlin successively. He graduated in 1848 as doctor of philosophy with the thesis De forma et incremento strtorum crassirorum in plantarum cellulis, and rapidly became a leader in the great botanical renaissance of the 19th century. His contributions to scientific allogy were of striking interest. Pringsheim was among the very first to demonstrate the occurrence of a sexual process in this class of plants, and he drew from his observations weighty conclusions as to the nature of sexuality. Together with the French investigators G. Thuret and E. Bornet, Pringsheim ranks as the founder of our scientific knowledge of the algae. Among his researches in this field may be mentioned those on Vaucheria (1853), the Oedogonea (1855-1858), the Coleochaetae (1860), Hydrodictyon (1861), and Ponderina (1862). The last-mentioned work was entitled Beobachtungen über die Porum de Zoosporen. This was a discovery of fundamental importance; the conjugation of zoospores was regarded by Pringsheim, with good reason, as the primitive form of sexual reproduction. A work on the course of morphological differentiation in the Spacelariae, a family of algae, is of great interest, inasmuch as it treats of evolutionary questions; the author's point of view is that of Naegeli rather than Darwin. Closely connected with Pringsheim's algalogical work was his long-continued investigation of the Saproleginiae, a family of algae of fungi, some of which have become notorious as the causes of disease in fish. Among his contributions to our knowledge of the higher plants, his exhaustive monograph on the curious genus of water-trens, Sinnia, deserves special mention. His career as a morphologist culminated in 1876 with the publication of a memoir on the alteration of generations in the thallophytes and mosses. From 1874 to the close of his life Pringsheim's activity was chiefly directed to physiological questions; he published, in a long series of memoirs, a theory of the carbon-assimilation of green plants, the central point of which is the conception of the chlorophyll-pigment as a screen, with the main function of protecting the protoplasm from light-rays which would neutralize its assimilative activity by stimulating too active respiration. This view has not been accepted as offering an adequate explanation of the phenomena. Pringsheim founded in 1858, and edited till his death, the classical Jahrbuch für wissenschaftliche Botanik, which still bears his name. He was also founder, in 1882, and first president, of the German Botanical Society. His work was for the most part carried on in his private laboratory in Berlin; he only held a teaching post of importance for four years, 1864-1868, when he was professor at Jena. In early life he was a keen politician on the Liberal side. He died in Berlin on the 6th of October 1894.

A fuller account of Pringsheim's career will be found in Nature, (1805) vol. ii., and in the Berichte der deutschen botanischen Gesellschaft, (1895) vol. xiii. The latter is by his friend and colleague, Ferdinand Cohn. (D. H. S.)

PRINSEP, JAMES (1799-1840), Anglo-Indian scholar and antiquary, was born on the 20th of August 1799. In 1819 he was given an appointment in the Calcutta mint, where he ultimately became assay-master, succeeding H. H. Wilson, whom he likewise succeeded as secretary of the Asiatic Society. Appointed to an archetical work (chiefly at Benares), his leisure was devoted to Indian inscriptions, and he is remembered as the first to decipher and translate the rock edicts of Asoka. Returning to England in 1838 in broken health, he died in London on the 22nd of April 1840. Prinsep's Ghat, an archway on the bank of the Hugli, was erected to his memory by the citizens of Calcutta.

PRINSEP, VALENTINE CAMERON (1838-1904), English artist, was born on the 4th of February 1838. His father, Henry Thoby Prinsep, who was for sixteen years a member of the Council of India, had settled at Little Holland House, which became a centre of artistic society. Henry Prinsep was an intimate friend of G. F. Watts, under whom his son first studied. Val Prinsep also worked in Paris in the atelier Gleyre; and "Taffy" in his friend Du Maurier's novel Tribly, is said to have been sketched from him. He was an intimate friend of Millais and of Burne-Jones, with whom he travelled in Italy. He had a share with Rossetti and others in the decoration of the hall of the Oxford Union. He first exhibited at the Royal Academy in 1862 with his "Blanca Capella," his first picture, which attracted marked notice, being a portrait (1866) of General Gordon in Chinese costume; the best of his later exhibits were "À Versailles," "The Emperor Theophilus chooses his Wife," "The Broken Idol" and "The Goose Girl." He was elected A.R.A. in 1879 and R.A. in 1894. In 1877 he went to India and painted a huge picture of the Delhi durbar, exhibited in 1880, and afterwards hung at Buckingham Palace. He married in 1884 Florence, daughter of the well-known collector, Frederick Leyland. Prinsep wrote two plays, Cousin Dick and Monseigneur le Duc, produced at the Court and the St James's theatres respectively; two novels; and Imperial India: an Artist's Journal (1879). He was an enthusiastic volunteer, and one of the founders of the Artists' Corps. He died on the 11th of November 1904.

PRINT, the colloquial abbreviation used to describe printed cloths generally, though it is most commonly applied to the staple kinds of cotton goods. The word must be distinguished from "printer," which refers to the regular kinds of cotton cloths intended for printing. (See TEXTILE PRINTING.)

PRINTING (from Lat. impressare, O. Fr. emprendre), the art or practice of transferring by pressure, letters, characters or designs upon paper or other implantable surfaces, usually by means of ink or oily pigment. As thus defined, it includes three entirely different processes: copperplate printing, lithographic or chemical stone-printing, and letterpress printing. The difference between the three lies in the nature or conformation of the surface which is covered with the pigment and afterwards gives a reproduction in reverse on the material impressed. For the nature and method of preparing these surfaces see respectively ENGRAVING (and allied articles), LITHOGRAPHY and TYPOGRAPHY. In copperplate printing the whole of the plate is first inked, the flat surface is then cleaned, leaving ink in the incisions or trenches cut by the engraver, so that, when dampened paper is laid over the plate and pressure is brought to bear, the paper sinks into the incisions and takes up the ink, which makes an impression in line or lines on the paper. In lithographic printing the surface of the stone, which is practically level, is protected by dampening against taking the ink except where the design requires. In letterpress printing the printing surface is in relief, and alone receives the ink, the remainder being protected by its lower level. Before the invention of typography, pages of books, or anything of a broadside nature, were printed from woodcuts, i.e. blocks cut with a knife on wood plankwise, as distinct from wood engravings which are cut with a burin on the end grain, a more modern innovation. These woodcuts, like the lithographic or engraved surface, served one definite purpose only, but in typography the types can be distributed and used again in other combinations.

The term "printing" is often used to include all the various processes that go to make the finished product; but in this article it is properly confined to "press-work," i.e. to the work of the printing-press, by which the book, newspaper, or other printed article, when set up in type and ready as a surface to be actually impressed on the paper, is finally converted into the shape in which it is to be issued or published.

History of Printing-press.

Before dealing with modern machinery it will be necessary to consider the historical evolution of the printing-press, especially since the middle of the 19th century, from which point printing machinery has developed in a most remarkable manner.
It is not clear how the first printers struck off their copies, but without doubt Gutenberg did use at an early period in his career a mechanical press of some kind, which was constructed of wood. In fact he could not have produced his famous forty-two line Bible without such aid.

The earliest picture of a press shows roughly the construction to have been that of an upright frame, the power exerted by a movable handle, placed in a screw which was tightened up to secure the requisite impression, and was loosened again after the impression was obtained. The type pages were placed on a flat bed of solid wood or stone, and it was quite a labour to run this bed into its proper position under the hanging but fixed horizontal plane, called the platen, which gave the necessary impress when screwed down by the aid of the movable bar. This labour had to be repeated in order to release the printed sheet and before another copy could be struck off. This same press, with a few modifications, was apparently still in general use till the early part of the 17th century, when Willem Janszon Blaeu (1571-1638) of Amsterdam, who was appointed map maker to the Dutch Republic in 1633, made some substantial improvements in it. Our first authority on printing, Joseph Moxon, in his *Mechanick Exercises, as Applied to the Art of Printing* (vol. I., 1683), says, "There are two sorts of presses in use, viz. the old fashion and the new fashion," and he gives credit to Blaeu for the invention of the new and decidedly improved press (fig. 1).

Blaeu's improvement consisted of putting the spindle of the screw through a square block which was guided in the wooden frame, and from this block the platen was suspended by wires or cords. This block gave a more rigid platen, and at the same time ensured a more equal motion to the screw when actuated by the bar-handle. He also invented a device which allowed the bed on which the type pages were placed to run in and out more readily, thus reducing the great labour involved in that part of the work of the older form of press, and he also used a new kind of iron lever or handle to turn the screw which applied the necessary pressure. The value of these various improvements, which were in details rather than in principles, was speedily recognized, and the press was introduced into England and became known as the "new fashion."

From this it will be observed that in a general way there had only been two kinds of wooden presses in use for a period of no less than three hundred and fifty years, and when the work of some of the early printers is studied, it is marvellous how often good results were obtained from such crude appliances.

The iron press (fig. 2) invented by Charles, 3rd earl Stanhope (1753-1816), at the end of the 18th century was a decided advance on those made of wood. Greater power was obtained at a smaller expenditure of labour, and it allowed of larger and heavier surfaces being printed. The chief points of the iron press consisted of an improved application of the power to the spindle. The main part of it was the upright frame or staple, of iron; the feet of this staple rested upon two pieces of substantial timber dovetailed into a cross, which formed a base or foundation for the complete press to stand upon. The staple was united at the top and bottom, but the neck and body were left open, the former for the mechanism and the latter for the platen and the bed when run in preparatory to taking the impression. The upper part of the staple, called the nut, answered the same purpose as the head in the older kind of wooden press, and was in fact a box with a female screw in which the screw of the spindle worked. The lower portion of the neck was occupied by a piston and cup, in and on which the toe of the spindle worked. On the near side of the staple was a vertical pillar, termed the arbor, the lower end of which was inserted into the staple at the top of the shoulder—the upper end passing through a top-plate, which being screwed on to the upper part of the staple held it firmly. The extreme upper end of the arbor, which was hexagonal, received a head, which was really a lever of some length; this head was connected by a coupling-bar to a similar lever or head, into which the upper end of the spindle was inserted. The bar by which the power was applied was fixed into the arbor, and not into the spindle, so that the lever was the whole width of the press, instead of half, as in Blaeu's wooden press, and it was better placed for the application of the worker's strength. There was also another lever to the arbor head in addition to that of the spindle head; and lastly, the screw itself was so enlarged that it greatly increased the power. The platen was screwed on to the under surface of the spindle; the table or bed had slides underneath which moved in, and not on, ribs as in the older form of press, and was run in and out by means of strips of webbing fastened to each end and passed round a drum or wheel. As the platen was very heavy the operator was assisted in raising it from the type-forme by a balance weight suspended upon a hooked lever at the back of the press. This somewhat counterbalanced the weight of the platen, raised it after the impression had been taken, and brought the bar-handle back again to its original position, ready for another pull.

The Stanhope press, which is still in use, was soon followed by other hand-presses made of iron, with varying changes of details. The most successful of these were the Albion and Columbian presses, the former of English manufacture, and the latter invented (1816) by an American, George Clymer (1754-1834), of Philadelphia.

The Albion press (fig. 3), which was designed by Richard Whittaker Cope, was afterwards much improved upon by John Hopkinson (1840-1898). It is still used where hand printing prevails, and it was this form of press which was employed by William Morris at his famous, but short-lived, Kelmscott Press,
in the production of many sumptuous books, the most celebrated of which was the *Chaucer*, a large folio volume, illustrated by Sir Edward Burne-Jones. The chief characteristics of the Albion are its lightness of build and its ease in running; the pull is short, the power great, and the means whereby it is attained so simple that the press does not readily get out of order. It is easily taken to pieces for cleaning, and readily re-erected. The power is obtained by pulling the bar-handle across, which causes the type surface with a roller which carries just sufficient ink properly distributed to preserve uniformity of “colour.”

Having dealt with hand-presses, we must now go back to the end of the 18th century, when the first experiments were made to devise some mechanical means of producing larger printed sheets, and at a quicker rate. In England the broad distinction between “presses” and “machines” is generally considered to rest in the fact that the former are worked by hand, and the latter by steam, gas or electricity; and the men who work by these two methods are called respectively “pressmen” and “machine minders” or “machine managers.” But in America the terms “presses” and “pressmen” are universally applied to machines and the men who operate them. For the purposes of this article presses and machines are used as synonymous terms.

Various schemes had been propounded with a view of increasing the output of the hand-press, and in 1790 William Nicholson (1753–1815) evolved his ideas on the subject, which were suggestions rather than definite inventions. Nicholson was not a printer, but, as he was an author and editor, it is presumed that he had some knowledge of printing. His proposals were to print from type placed either on a flat bed or a cylinder, and the impression was to be given by another cylinder covered with some suitable material, the paper being fed in between the type and the impression cylinder, and the ink applied by rollers covered with cloth or leather, or both. While Nicholson’s schemes did not bear any practical result they certainly helped others later on. His suggestion to print from type made wedge-shaped (that is, smaller at the foot and wider at the top) to allow of its being so fixed on a cylinder that it would radiate from the centre and thus present an even printing surface, was adopted later by Applegath and others, and really was the first conception of printing on the rotary principle which has now been brought to such perfection.

Fig. 3.—Payne & Sons’ Albion Hand-press.

an inclined piece of wedge-shaped steel, called the chill, to become perpendicular; in so doing the plate is forced down, and the impression takes place at the moment the chill is brought into a vertical position. On the return of the bar the platen is raised by a spiral spring, placed in a box and fixed at the head of the press. The larger sizes of these presses usually print a sheet of double crown, measuring 30×20 in.

Although the Columbian is not so much in demand as the Albion, it is still employed for heavy hand-work because of its greater stability and power. This power is acquired by a very massive lever, moving on a pivot bolt in the top of the near side of the staple, and passing across the press to the further side of the frame, at which end the power is applied through the coupling-bar by a bar-handle working from the near side. The platen is attached to the centre of the lever by a square bar of iron, and its vertical descent is assured by two projecting guides, one from each cheek; it is then raised from the type-forme, and the iron bar carried back by two levers—the one attached to and above the head and weighted with the eagle; the other behind the press, attached to the arm to which the coupling-bar is fixed, and which also has a weight at the end. The great power of this press adapts it to the working of large and solid forms in printing, but it is somewhat slower in action than the Albion press, which is both lighter in construction and quicker in working.

The average output of the modern hand-press, when all is made ready for running, is about two hundred and fifty impressions per hour. This number, it should be said, is the product of two men who work together as “partners.” One inks the type-forme and keeps a sharp look-out for any inequality of inking, and sees generally that the work is being turned out in a workmanlike manner. The other lays on the sheet to certain marks, runs the carriage in under the platen, and pulls the bar-handle across to give the necessary impression. He then runs back the carriage and takes out the printed sheet, which he replaces by another sheet, and repeats the different operations for the next impression. During the interval between taking off the printed sheet and laying on the next one his partner inks
which in turn gave the needful impression as the type-formes passed underneath. The sheets were laid or fed to certain marks between the frisket and tympan, and when these were closed together the carriage was propelled under the platen and the impression was given to that portion of the machine, while at the other end another sheet was being fed in ready to receive its impression in due course.

It was once thought that the finest work could not be produced by a cylinder impressing a surface in the progress of its reciprocating motion, but that it was likely to give a slurred or blurred impression. This is why machines of flat construction were so long employed for the best class of work. But cylinder presses are now made so truly turned, and geared to such nicety, that this idea no longer prevails. The cylinder press is able to produce generally quite as good work as the double platen, its speed is much greater, and it requires a smaller amount of power to drive it.

The perfecting machine has had a great vogue, and has been much improved from time to time, especially in America, though the two-revolution machine in recent years superseded it, whether temporarily or not being still uncertain. We shall deal with it more fully below in relation to the modern and more complicated class of machinery; and this also applies to the ordinary stop or single cylinder, and small platen machines, both of which have been in use many years, and are still in demand.

Perfecting Machines. Nicholas's ideas. The first printing surface used was ordinary type, because the difficulty of curving the stereotype plates had not been surmounted. This type was fixed, both in vertical and in perpendicular positions, upon a cylinder, round which rotated other cylinders, which held and compressed the sheets against the larger one, which also revolved and carried the printing surface. These machines were made to print several sheets at a time, and were called four-, six-, eight-or ten-feeders, according to the number of sheets fed in and printed. They necessitated a great deal of labour, because each sheet required a separate layer-on and take-off besides the superintending printer, and other hands to carry away the sheets as fast as they accumulated at the different taking-off boards. Bolders, that is sheets all banded together, were run through a part of machine various improvements were made from time to time by different manufacturers, each profitting by the experiences of the others, and two kinds of such revolving presses may now be given as examples.

After many experiments Augustus Applegath (1789–1871) in 1848 constructed for The Times (London), a machine which was an eight-feeder, built entirely on the cylindrical principle, the cylinders placed not in a horizontal but in a vertical position. The type was fixed on a large cylinder, and instead of the printing surface presenting a complete circle, the different columns were each arranged so as to form a polygon. Around this large type cylinder were eight smaller ones, all upright, for taking the impression for each of the eight sheets fed in separately, and rollers were so arranged as to apply the ink to the type as it passed alternately from one impression cylinder to the other. The sheets were laid in from eight different feed-boards, placed horizontally, and they passed through tapes, when they were seized by another series of tapes and then turned sideways between their corresponding impression and type cylinder, thus obtaining sheets printed on one side only. The impression cylinder then delivered the sheets separately (still in a vertical position) into the hands of the boys employed as takers-off. The results from this press were, at the time, considered fairly satisfactory, the number of copies (about 8000) printed per hour from one type-forme having been materially increased by the employing of the eight different stations to feed the sheets in, all of which in turn were printed from the same single type surface.

About 1845 Robert Hoe & Co. of New York, and subsequently of London, had constructed, to meet the increased demands of newspapers, the "Hoe Type Revolving Machine," one good point of which was an apparatus for securely fastening in the type on a large central cylinder fixed horizontally. This was accomplished by the construction of cast-iron beds, one for each separate page (not column, as in Applegath's machine). The column rules were made tapering towards the feet of the type, and the type was securely locked in on these beds so that it could be held firmly in the required position to form a complete circle, thus allowing the cylinder to revolve at a greater speed than Applegath's, which was polygonal. Around the large type cylinders were placed the smaller impression cylinders, the number of these being governed by the output required. Hoe's first presses were four-feeders, but as many as ten feeds were supplied, as in the case of the two presses built to replace the Applegath machine for The Times, each of which produced about 2,000 impressions from each feed, making a total of 20,000 per hour, printed on one side, or from two machines 20,000 sheets printed on both sides. As will be observed, the only differences in principle between these two type revolving machines were in the positions of the respective cylinders, and the fixing of the type to form a printing surface.

It was Sir Rowland Hill who first suggested the possibilities of a press which should print both sides at once, from a roll or reel of paper. This was about 1825, but it was William A. Bullock (1813–1867) of Philadelphia who in 1865 invented the first machine to print from a continuous web of paper. This machine had two pairs of cylinders, that is, two type or stereotype cylinders, and two others which gave the impression as the web passed between. The second impression cylinder was made somewhat larger so as to give a greater tympan surface, to lessen the off-set from the side first printed. In his machine the stereotype plates were not made to fill the whole periphery of the forme cylinders so as to allow of the sheets being cut before printing, a difficulty which the first machines did not satisfactorily overcome. The sheets were severed by knives placed on the cylinders, and when cut were carried by grippers and tapes; and delivery was made by means of automatic metal fingers fixed upon endless belts at such distances apart as to seize each sheet in succession as it left the last printing cylinder. These presses were not at first reliable in working, especially in the cutting and delivery of the sheets after printing, but were finally so far improved that the Bullock press came into quite general use. The inventor was killed by being caught in the driving belt of one of his own presses.

Modern Presses.

The machines invented during the second half of the 19th century and still in general use, are best classified as follows:

1. The iron hand-press, such as the Albion or the Columbian, used for the pulling of proofs, or for the printing of limited éditions de luxe.
2. Small platen machines (worked by foot or power) used for the printing of cards, circulars and small jobbing or commercial work.
3. Single cylinder machines (in England generally called Wharfetails"), usually built on the "stop" cylinder principle, and print one side of the sheet only.
4. Perfecting machines, usually with two cylinders, and printing or "perfecting" both sides of a sheet before it leaves the machine, but with two distinct operations.
5. Two-revolution machines, which, although with but one cylinder, have largely superseded perfecting machines, as their output has been increased and the quality of their work compares favourably with that of the average two-cylinder.
6. Two-colour machines, usually made with one feed, that is, with only one cylinder, but with two printing surfaces, and two sets of inking apparatus one at each end of the machine. Occasionally these machines are made with two cylinders.
7. Rotary machines, printing from an endless web of paper from curved stereotype or electrotype plates, principally used...
PRINTING

for newspaper or periodical work. They are made to print upon a single reel, or upon two, four or even eight reels, in both single or double widths, i.e., two or four pages wide.

The hand-press has already been sufficiently described, and we may proceed to deal with the other classes.

The small but useful platen machine (fig. 4) is very largely employed in those printing-houses that make commercial work a speciality. The smaller machines can be worked with the foot, but if the establishment is equipped with power it is customary to gear them for driving. The larger machines require power. As its name implies, the type bed and impression platen are both flat surfaces as in the hand-press, but as they are self-inking and are easily driven, the average output is about 1000 copies per hour, and but one operator is required, whereas two men at a hand-press can produce only 250 copies in the same time. In design these platen presses usually consist of a square frame with a driving shaft fixed horizontally across the centre of it. This shaft is attached to a large fly-wheel which gives impulses to the press when started and assists in carrying over the impression when the platen is in contact with the printing surface. The type-forme is usually fixed in an almost vertical and stationary position, and it is the platen which the sheet is laid which rises from the horizontal position to the vertical in order to give the necessary impact to produce a printed impression from the type-forme. Practically this platen is, as it were, hinged at the off side, near the type bed, and its rise and fall is effected by the use of two arms, one on each side of the platen, which derive an eccentric motion from cams geared in connexion with the shaft. When the sheet is printed and the platen falls back to the horizontal the operator removes it with one hand and with the other lays on a fresh sheet. Generally the larger of these machines will print a sheet up to 21 × 16 in.

The modern single or " stop " cylinder, quite different in construction from the old single cylinder machines, largely succeeded the double platen machine. The principle of the stop cylinder was really a French invention, but it has been more commonly adopted in Great Britain, where the machines are known as " Wharfdales " (fig. 5). They are much used for the printing of books and commercial work. The average production is about 1000 copies per hour. The type bed travels with a reciprocating motion upon rollers or runners made of steel, the bed being driven by a simple crank motion, starting and stopping without much noise or vibration. All the running parts are made of hard steel. The cylinder is " stopped " by a cam motion while the bed is travelling backward, and during this interval the sheet to be printed is laid against the " marks," and the gripper closes on it before the cylinder is released, thus ensuring great accuracy of lay, and consequent good register. After the impression is made the sheet is seized by another set of fingers and is transferred to a second and smaller cylinder over the larger one, and this smaller cylinder or drum delivers the sheet to the " flyer," or delivery apparatus, which in turn deposits it upon the table. The inking arrangements are usually very good, for, by a system of racks and cogs which may be regulated to a nicety, the necessary distribution of ink and rolling of the printing surface runs in gear with the travelling type bed of the machine. All the accessories for inking are placed at the end of the machine, the ink itself being supplied from a ductor, which can be so regulated by the keys attached to it as to let out the precise amount of pigment required. The ink passes to a small solid metal roller, and is then conveyed by a vibrating roller made of composition to a larger and hollow metal cylinder or drum which distributes the ink for the first time. This revolves with the run of the machine and at the same time has a slight reciprocating action which helps the distribution. A second vibrating composition roller conveys the ink from this drum to the distributing table or ink slab, on which other rollers, called distributors, still further thin out the ink. As the type bed travels, larger composition rollers, called inkers, placed near the cylinder, adjusted to the requisite pressure on the type, pick up the necessary amount of ink for each impression and convey it to the type as it passes under them. Usually three or four such rollers are required to ink the forme.

The perfecting machine is so named because it produces sheets printed on both sides or, in technical language, " perfected." This operation is performed by two distinct printings. The perfecting class of machine has been in use a great many years, although both the stop-cylinder and the two-revolution press have to some extent superseded it. It is perhaps best adapted for the printing of newspapers or magazines having circulations that do not require rotary machines intended for long runs. Although some perfecting machines have been made with one cylinder only, which will "do itself," generally they are made with two cylinders, and it is with this class that we are particularly concerned. There are various makes of perfecting machines of which the Dryden & Foord is shown in fig. 6; among the best recent types is the Huber Perfecter.

Although the two-type beds have a reciprocating motion, as in the ordinary one-sided press, the two cylinders rotate towards each other. The frame of the machine, owing to the fact that it contains two carriages and a double inking apparatus, is long; the exact size depending on the size of the sheet to be printed. Close to the large cylinders are the inking rollers, which take the necessary amount of ink, each set from its own slab as it passes under, and these rollers convey the requisite ink to the printing surface as the forme-carriage runs under its own cylinder. The distinctive feature is the ingenious manner in which the sheets are printed first on one side, and then on the other. This is performed by carrying them over a series of smaller cylinders or drums by means of tapes. The pile of sheets
to be fed in stands on a high board at one end. The sheet is laid to its mark and is conveyed round an entry drum; thence it is carried round the first impression cylinder, and under this, moving at the same speed as the cylinder, is the type bed containing the inner forme already inked. The paper then receives its impression on the first side. In the older type of machine it is next led up to the right-hand one of the two reversing drums, which are placed above the large printing cylinders, and over which it passes with the printed side downwards. It is then brought under the second or left-hand drum, and so on to the other large impression cylinder, with the blank side of the sheet exposed to the type of the outer forme on the table underneath. Thus it will be seen that the sheet is reversed in its travel between the first and second large cylinders which give the impression. The sheet is then finally run out and delivered in the space between the two large cylinders, and laid on the delivery board—usually with the aid of flyers. In the more recent type of direct into the machine. Another variety employs grippers somewhat after the manner of the ordinary single cylinder. The Anglo-French perfecting machine is one of that class. As a rule most double-cylinder presses produce on an average about 1000 copies per hour, printed both sides.

The two-revolution machine is another one-cylinder machine built on the reciprocating principle. Its speed is greater than the stop cylinder (it may be geared to produce from 1500 to 2000 copies per hour, printed one side only). The Miehle (fig. 7), which is of American design but now made also in Great Britain, is a good example of this kind of machine and is much used, especially for illustrated work. It has

perfecting machines the sheet is fed directly into grippers, change taking place when grippers on each cylinder meet, the outer forme grippers taking the sheet from the inner forme grippers.

This is a general description of the principles on which these machines are built but, as in other classes, there are many variations in details. For example, there are the drop-bar, the web and the gripper methods of feeding these presses. In the first case a bar descends upon the paper after it is laid to point marks, and this bar, having a rotary motion, runs the sheet between a roller and a small drum into the machine. The web arrangement consists of a series the high over-feedboard, and the taking-off apparatus is automatic but on a different plan from that of the ordinary Wharfedale, the sheets being carried over tapes with the freshly-printed side uppermost, thus preventing smearing; they are then carried on to the heap or pile by the frame or long arms placed at the end of the machine. A recent feature of this machine is the tandem equipment, whereby two, three or even four machines may be coupled together for colour work. Only one layer-on is required and register is obtained automatically throughout.

The principle of the two-revolution press is that the cylinder
always rotates in the same direction, and twice for each copy given, once for the actual impression, and again to allow of the return of the forme-carriage in its reciprocating action. This also allows time for the feeding in of the next sheet to be printed. Among other advantages claimed for this press is that the movement which governs the action of the type bed in reversing is so arranged that the strain which sometimes occurs in other reciprocating machines is considerably reduced; another is that the registering or correct back of the page on the second side in printing is uncommonly good; but this depends much upon the layer-on. In many of the old kinds of two-revolution machines, owing to the cylinder being geared separately from the type bed, it was apt to be occasionally thrown out, but in the Miehle for instance, it is only out of gear in reversing, and in gear while printing. Great strength is imparted to the frame, and the type bed is particularly rigid. These points, together with a truly turned and polished cylinder, with carefully planned means of adjustment, much simplify the preparation of making-ready of any kind of type-forme or blocks for printing, which is carried out much in the same way as on the ordinary single cylinder, but in a more convenient manner. Many of these machines are made to print four double crowns, 60 × 40 in., or even larger.

The two-colour machine is generally a single cylinder (fig. 8) with one feed only, and the bed motion reciprocating. The two colours are printed each at one revolution from the two type-formes as they pass under the cylinder, which rotates twice in its travel. A double inking apparatus is of course necessary, and the inking arrangements are placed at the two extremities of the machine. In comparison with the ordinary single cylinder the two-colour machine is built with a longer frame, as is necessary to allow the two type-formes to pass under the cylinder, both in its travel forward and on its return. This cylinder on its return is stationary, in fact it might be called a double or rather an alternative stop-cylinder machine, with the inking facilities arranged somewhat on the same plan as on either a two-feeder or a perfecting machine. These two-colour presses are intended only for long runs, short runs may be worked to advantage separately on the ordinary single-colour machine. Generally, with the exception just mentioned, the machine is much the same as the ordinary stop or Wherfadal.

Before leaving the subject of printing with the reciprocating bed-motion, it may be mentioned that although in all modern machines of that kind the printed sheet is self-delivered, the imprinted paper has generally been fed in by hand, and for some classes of work is still done. But many automatic feeders have been invented from time to time, which, for the many purposes for which they are suitable must be reckoned part of a modern printing establishment.

As distinct from flat bed printing with a reciprocating motion, printing on rolls is the subject of this department of printing mechanics which has developed so very much in recent years. It seems almost as though this branch had reached its limit, and as though any further developments can only be a question of duplication of the existing facilities so as to print from a greater number of cylinders than, say, an octuple machine. This would be merely a matter of building a higher machine so as to take a larger number of reels arranged in decks. As the name implies, these presses are so constructed that both printing surfaces and paper to duplicate the type pages and to run several machines at the same time, thus producing copies with far greater rapidity. In some large offices as many as five machines were in constant use. About this period the English stamp duty on printed matter was repealed, and this materially aided the development of the newspaper press.

Subsequently the proprietors of The Times made various experiments with a view to making a rotary perfecting press, and as a result started the first one about 1866. It was somewhat similar in design to the Bullock press, so far as the printing apparatus was concerned, except that the cylinders were all of one size and placed one above the other. The sheets were severed after printing, brought up by tapes, and carried down to a sheett flyer, which moved backwards and forwards, and the sheets were alternately "flown" into the hands of two boys seated opposite each other on either side of the flyers. Hippolyte Marimont (1829–1894), of Paris, also devised a machine on a somewhat similar principle, making the impression and type cylinders of one size and placing them one over the other. About 1870 an English rotary machine called the "Victory" was made by Messrs. Duncan & Wilson. It printed from the web, and had a folder attached. An improved form of this machine is still in use. This machine had separate fly-boards for the delivery of the sheets. In 1871 Messrs. Hoe & Co. again turned their attention to the construction of a rotary perfecting press to print from the reel or continuous web of paper, and from stereotype plates fastened to the cylinder.

The rotary presses in use at the present time are indeed wonderful specimens of mechanical ingenuity, all the various operations of damping (when necessary), feeding, printing (both sides), cutting, folding, pasting, wrapping (when required) and counting being purely automatic. These machines are of various kinds, and are specially made to order so as to cope with the particular class of work in view. They may be built on the "deck" principle of two, three, four, or even more reels of paper, and either in single width (two pages wide), or double width (four pages wide). Single and two-reel machines are generally constructed on the "straight line" principle, i.e. arranged with the paper at one end of the machine,
and passing through the cylinders to the folder at the other end where the copies are delivered. Three- and four-reel machines have also been constructed on the same principle, but the more usual arrangement of the four-reel press is to place two reels at either end, with the folders and delivery boards in the centre. This makes it possible to operate them as independent machines, or to run in combination with each other.

When presses are made in double width a two-reel machine is known as a quadruple, a three-reel as a sextuple, and a four-reel as an octuple machine. Double sextuple and double octuple machines are made, having six and eight reels respectively. The quadruple machine is a favourite one and is perhaps most in demand for newspaper work. This press prints from two reels of the double width. The first reel is placed to the right of the machine near the floor, and the second at the back of the machine and at right angles to it. A quadruple machine will produce 48,000 copies per hour of four, six or eight pages, and proportionately less of a greater number of pages; all folded, counted and pasted if required. The four cylinders, which are on the right-hand side of the press, are respectively the printing and impression cylinders—the two inside ones being those giving the impression, and the two outer ones bearing the printing surfaces. The inking arrangements are placed at the two extreme ends of these four drums or cylinders, thus being near the type surfaces in each case. As the paper is unwound from the reel below it travels between the first two cylinders when it is printed on the first side; it then passes to the third and fourth cylinders, which give it the second backing side, thus "perfecting" the printed sheet. From this point the long sheet is carried overhead to the left-hand side of the machine, where it is cut longitudinally and divided, and then associated with the other web similarly printed by the other half of the press. They then descend into the two different folders, where they are folded and cut—the copies being discharged on to the delivery boards situated at the two sides of the left-hand portion of the machine, and each quire is counted or told off by being jogged forward. This description applies to one half of the machine only, for while that is in operation the same thing is being repeated by the other half situated at the back.

Another machine, somewhat complex but quite complete in itself, is one constructed by Messrs Robert Hoe & Co. in London from drawings and patterns sent over from New York for weekly papers of large circulation. Double sets of plates are placed on the main machine, which is capable of taking twenty-four pages, but by using narrower rolls the number of pages may be reduced to either sixteen or twenty if a smaller paper is desired. In addition to the body of the paper it prints a cover, and is capable of producing 75,000 complete copies per hour, folded, inserted, cut, pasted and covered. That portion of the machine which prints the cover is fed from a narrower reel of a different colour of paper from that used for the inside pages. The printing surface for one side of the cover is placed at one end of the cylinder and the reverse side is placed at the other end. This ingenious combination results in the printing of one cover for every copy of the paper.

The double octuple machines (fig. 9) erected by the same firm for the printing of Lloyd's Weekly News were probably, in 1908, the latest development in rotary printing. These presses print from eight different reels of the double width, four placed at each end of the machine, the delivery being in the centre, and from eight sets of plates, four pages on each type cylinder, making a total of thirty-two pages in all. Each press produces of that number of pages 50,000 copies per hour, printed both sides, cut, folded and counted off in quires complete; by increasing the sets of stereotype pages the same machine will produce 100,000 copies per hour of sixteen pages, and by duplicating the folding and delivery apparatus, 200,000 copies of eight pages of the same size. This mammoth press measures 54 ft. in length, 19 ft. in height and 12 ft. across; its dead weight is about 110 tons, and roughly 100,000 different pieces of metal were used in its construction. The rough cost of such a machine is probably about £18,000. Such a press requires two 55 h.p. motors, one at each end, to drive it. The press is practically four quadruple machines built together, each of which can be worked independently of the other. The paper is fed from reels placed at the two ends in decks, one above the other, each reel containing about five miles of paper, and weighing about fourteen hundredweight. The process of unwinding these long reels of paper in the course of printing takes only half an hour; they are arranged on a revolving stand so that directly they are spent the stand is turned half way round, and four other full reels already in position are presented ready to be run into the press. This ingenious arrangement, whereby the reels can be changed in about three minutes, obviates the loss of time previously incurred by the press being kept standing while the empty spindles were removed and replaced with four full reels.

Having described some representative types of the different classes of printing-presses in use, we may now treat of the methods employed by the workmen in securing the best results in printing. The real art of printing, as far as presswork is concerned, lies in the careful preparation of the printing surface for printing before running off any number of impressions. This preparation is technically called "making-ready," and is an operation requiring much time and care, especially in the case of illustrated work, where artistic appreciation and skill on the part of the workman is of great assistance in obtaining satisfactory and delicate results. Theoretically, if both type and press were new, little or no preparation should be necessary, but practical experience proves that this need of preparation has not yet been entirely obviated and still remains an important factor. Single proofs of type, stereotype, electrotype or blocks of any description can often be struck off without making-ready with fairly good results, but if precision of "colour" (that is, inking) and uniformity of impression throughout a volume are desired, it is necessary to put the forme, whether type or blocks or both, into a proper condition before starting the printing of an edition, whatever its number. And this applies to all good work produced from whatever presses or machines other than those built on the rotary principle. In these, even if time permitted, little can be done in the way of making-ready; nor
is it really necessary for newspapers, printed and read one day, and then generally thrown away the next. But for finely printed work this preparation is essential; the actual results vary with the operator, both as regards quality and, what is very important to the employer, in the length of time taken. Some men labour more at it than others, and it is considered that a press is only really paying while it is actually running.

The system of making-ready employed now is quite different from that in use when it was necessary to dampen paper before it could be satisfactorily printed. It was then customary to print with a good deal of packing, usually consisting of a thick blanket together with a number of paper sheets, and then to fasten the impression, after the sheets were dry, by removing them under the press without any cold-pressing in a hydraulic press. It is still the best method for obtaining first-rate results in fine work, where hand-made or other rough paper is used. But the demand for cheap literature required quicker means of production, and the press without the specially made by the half-tone process, necessitated the use of smooth paper and a faster drying ink, both of which are to be deprived, because to calender the paper to the degree requisite for this kind of printing practice is a slow process and the ink, being softer, the ink quicker in drying the pigment undoubtedly suffers. On the other hand, there has been a compensating advantage in the fact that improved machinery has been demanded for this class of work, and this has been gratified by the American manufacturers, who have taken the initiative in the change of methods in printing. Cylinders are now turned so truly and ground to such a nicety that very little packing is required between type and paper. There is less risk of the impression being so far out of line that the impression would be so faint that it could hardly be seen. These differences of impression are called respectively "high" and "low". All these difficulties have to be rectified by the printer either over-laying the type with a larger piece of wood, or cutting away a small portion of the cylinder when the cylinder is about correct, and the impression sheet has been taken with neither too many nor too few sheets on the cylinder, it will be a matter rather of over-laying, or patching up, than of cutting down. After each trial sheet is struck off, it is treated precisely as described when the impression is made on the first sheet. It may even be necessary for fine printing to repeat this a third time, especially if the forme includes blocks of any kind. When this preparation is completed, the whole is covered up with a sheet of paper, which, with care to leave one edge free, is fastened down on top of the first sheet. This may even be necessary for fine printing to give any finishing touches to it before beginning to run.

If the forme to be printed consists of both type and blocks mixed, a somewhat different treatment has to be employed in order to put the blocks into a relative position with the type for printing. This is done by the usual trial impression sheet, and, as blocks are found to vary much in height and are generally low as compared with type, this deficiency has to be remedied by underlaying the blocks so that they are brought to the height of the type, or a shade higher. This is usually done by pasting layers of thickish paper, or even thin cards, underneath the blocks. This must be carefully done so as to make them stand squarely and firmly on their base, in order that they may not rock and give a slurr in printing. After the underlaying, and to emphasize the respective degrees of light and shade in the illustrations, a separate and careful underlaying is required for the blocks before anything is done to the main forme. This is especially necessary for the blocks to be worked up into the largest kinds of woodcuts, which require a different cutting of perhaps three different thicknesses, all on thin hard paper, to give their full effect. But with half-tone process illustrations very little over-laying is required, particularly if the blocks can be worked up to the proper height by underlaying in the first instance—the various tones being in the block itself—and it is little more than a matter of sharp, hard impression to give full effect to these, if both paper and ink are suitable. For line process blocks a still different treatment in underlaying is necessary. The blocks are built up, which are nearly always found in this kind of block. Here too it is essential that the preliminary underlaying be done with extreme care if good work is desired. The originals and the engraver's proofs are of great assistance to the workman in bringing out all the details of an illustration when he is preparing it for printing. In rotary printing from the curved stereotype plate and from the endless web of paper much can be done to assist the printer if good stereotype plates are available, and if the impression of the stereotype plate has been, both by the artist and the engraver, a very careful and exact one. It is not usually considered as representative presses have been dealt with in this work, but there are many others, some of which have been most ingeniously constructed for special purposes. Process engraving has practically superseded wood engraving, and all the new processes have brought with them certain changes, requiring a different treatment in the material and the printing. Some of these altered conditions are to be regretted. For instance, it is unfortunate that the quality and surface of papers have to be sacrificed to the demands for cheap literature, and this especially applies to newspapers.

The introduction of the autotype is of great advantage to those using rotary presses, because it allows the production of a large number of duplicate stereotype plates of satisfactory quality. The possibility of reducing the time between the case-room and machine department is usually so limited, for it permits several machines being quickly equipped with duplicate sets of the same pages. No amount of time is wasted in the effort to get out a set of proof fast. Electricity is supplanting both steam and gas, and is being installed in most large printing-houses, including newspaper offices. Suction gas is being tried in some offices as a supplanter of electricity and is said to be much cheaper. The system of driving the type motor is generally adopted, because it is found more economical and better for driving purposes, besides dispensing with the overhead shafting and belting, always unsightly, and dangerous to the workpeople. Special motors are being produced for each separate machine, and any machine can be set in motion by pressing a button. A printing-office of average size, which makes book printing a specialty, consists of many departments under the supreme control of a general manager. His deputy may be said to be the man in charge, but the work is still very nearly the same, being produced in a proper manner by the different departments. The progress of the work is as follows. The MS., or "copy" as it is called, is handed, with all the necessary instructions as to the time and place of delivery, out to the compositors in instalments as they finish the work already in hand. Formerly the greater bulk of composition was done on the piece-work system, but as machine composition has largely superseded hand composition, the compositors get their instructions, read the copy, and there is a greater tendency to have the work done on "establishment" ("tab"), i.e. fixed weekly wages. When the copy is in type a proof is struck off and sent to the proof reader, where the corrector of the printer. The next step is the "proofing," with the aid of a reading-boy, in order to clear the type from all errors, and, if these corrections are at all heavy, another proof, called the "revise," is submitted, together with the first marked one, so that the author may see that his emendations have been made. This may even be repeated, but when finally corrected the proof is marked "press"
and is sent to the printer with the necessary instructions as to printing. After another reading or revision in the reading closet it is set to the compositors, who make the final corrections in the type and hand the forme to the printing department to deal with. It is this department which contributes most of the business to the printing firm, and it requires a really good man at its head. He must be a thoroughly practical printer familiar with the different kinds of printing machinery. To make the department pay, the machines must be kept fully employed with the many classes of work that a large concern has to deal with; the wheels must be kept running as much as possible, and the time for making-ready curtailed as far as is consistent with the proper preparation of the forme. Here again it is most important that a sharp eye be kept on the materials used. Ink forms a large item in the total expenses of this department, besides which there are: oil for lubricating, turpentine and other solvents for cleaning, paper for proofs and making-ready, &c. He must be the man to superintend it all and keep it all in good order, the compositors, proofers, and other hands being employed for it.

COUNTING-HOUSE BUSINESS, Part II.

The counting-house deals with all accounts, both departments' and customers'.

PRIOR, MATTHEW (1664–1722), English poet and diplomatist, was the son of a Nonconformist joiner at Wimborne-Minster, East Dorset, and was born on the 21st of July 1664. His father moved to London, and sent him to Westminster, under Dr Busby. At his father's death he left school, and fell to the care of his uncle, a vintner in Channel Row. Here Lord Dorset found him reading Horace, and set him to translate an ode. He acquitted himself so well that the earl offered to contribute to the continuance of his education at Westminster. One of his schoolfellows and friends was Charles Montagu, afterwards earl of Halifax. It was to avoid being separated from Montagu and his brother James that Prior accepted, against his parents' wishes, a scholarship which Montagu had recently founded at St John's College. He took his B.A. degree in 1686, and two years later became a fellow. In collaboration with Montagu he wrote in 1687 the City Mouse and Country Mouse, in ridicule of Dryden's Hind and Panther. It was an age when satirists were in request, and sure of patronage and promotion. The joint production made the fortune of both authors. Montagu was promoted at once, and Prior three years later was gazetted secretary to the embassy at the Hague. After four years of this employment he was appointed one of the gentlemen of the king's bedchamber. Apparently, also, he acted as one of the king's secretaries, and in 1697 he was secretary to the plenipotentiaries who concluded the peace of Ryswick. Prior's talent for affairs was doubted by Pope, who had no special means of judging, but it is not likely that King William would have employed in this important business a man who had not given proof of diplomatic skill and good correspondence. Prior has not found his way into the catalogues of the better-known contemporaries, but his name is not mentioned among his qualifications, and this was recognized by his being sent in the following year to Paris in attendance on the English ambassador. At this period Prior could say with good reason that "he had commonly business enough upon his hands, and was only a poet by accident." To verse, however, which had laid the foundation of his fortunes, he still occasionally trusted as a means of maintaining his position. His occasional poems during this period include an elegy on Queen Mary in 1695; a satirical version of Boileau's Ode sur le prise de Namur (1695); some lines on William's escape from assassination in 1696; and a brief piece called The Secretary. After his return from France Prior became under-secretary of state and succeeded Locke as a commissioner of trade. In 1701 he sat in parliament for East Gristead. He had certainly been in William's confidence with regard to the Partition Treaty; but when Somers, Orford and Halifax were impeached for their share in it he voted on the Tory side, and immediately on Anne's accession he definitely allied himself with Harley and St John. Perhaps in consequence of this for nine years there is no mention of his name in connexion with any public transaction. But when the Tories came into power in 1710 Prior's diplomatic abilities were again called into action, and till the death of Anne he held a prominent place in all negotiations with the French court, sometimes as secret agent, sometimes in an equivocal position as ambassador's companion, sometimes as fully accredited but very unpunctually paid ambassador. His share in negotiating the treaty of Utrecht, of which he is said to have disapproved, personally led to its popular nickname of "Matt's Peace." When the queen died and the Whigs regained power he was impeached by Sir Robert Walpole and kept in close custody for two years (1715–1717). In 1709 he had already published a collection of verse. During this imprisonment, maintaining his cheerful philosophy, he wrote his longest humorous poem, Almsa; or, The Progress of the Mind. This, along with his most ambitious work, Solomon, and other Poems on several Occasions, was published by subscription in 1718. The sum received for this volume (4000 guineas), with a present of 5000 from Lord Harley, enabled him to live in comfort; but he did not long survive his enforced retirement from public life, although he bore his ups and downs with rare equanimity. He died at Wimpole, Cambridgeshire, a seat of the earl of Oxford, on the 18th of September 1721, and was buried in Westminster Abbey, where his monument may be seen in Poet's Corner. The History of His Own Time was issued by J. Bancks in 1749. The book pretended to be derived from Prior's papers, but it is doubtful how far it should be regarded as authentic.

Prior had very much the same easy, pleasure-loving disposition as Chaucer (with whose career his life offers a certain parallelism), combined with a similar capacity for solid work. His poems show considerable variety, a pleasant scholarship and great executive skill. The most ambitious, i.e. Solomon, and the paraphrase of the Nut-Brown Maid, are the least successful. But Almsa, an admitted imitation of Butler, is a delightful piece of wayward easy humour, full of witty turns and wellremembered allusions, and Prior's mastery of the octo-syllabic couplet is greater than that of Swift or Pope. His tales in rhyme, though often objectionable in their themes, are excellent specimens of narrative skill; and an epigrammatist he is unrivalled in English. The majority of his love songs are elegant and poetic, much in the manner of Parnassus; but in familiar or playful efforts, of which the type are the admirable lines To a Child of Quality, he has still no rival. "Prior's—says Thackeray, himself no mean proficient in this kind—"seem to me amongst the easiest, the richest, the most charmingly humorous of English lyrical poems. Horace is always in his mind, and his song and his philosophy, his good sense, his happy easy turns and melody, his loves and his Epicurianism, bear a great resemblance to that most delightful and accomplished master."

The largest collection of Prior's verses is that by R. Brimley Johnson in the "Aldine Poets" (2 vols., 1882). There is also a selection of Prior's poems in "The Parnassus Library," with introduction and notes by Austin Dobson (1889).

PRIOR (from Lat. prior—former, and hence superior, through O. Fr. priour), a title applied generally to certain monastic superiors, but also in the middle ages to other persons in authority. Under the Roman Empire the word prior is found signifying "ancestor." In the early middle ages it was commonly applied to secular officials and magistrates, and it remained all though the middle ages as the title of certain officials in the
Italian city states. Noteworthy among these were the famous *prima artis* at Florence. These were appointed governors of the Florentine republic when the Companies of the Arts seized the government in 1282.

The term *prior* was most commonly used to denote the superiors in a monastery, at first with an indefinite significance, but later, as monastic institutions crystallized, describing certain definite officials. In the Rule of St Benedict and other early rules the titles *praepositus* and *praelatus* (see *Prelate*) are generally used, but *prior* is also found signifying in a general way the superiors and elders in a monastery. When used by St Benedict in the singular number it seems (according to the commentator Ménard) to denote the abbot himself. At a later date in the order of St Benedict the title was applied to the monk next in authority to the abbot, though this usage was not adopted technically until the 13th century. In some monasteries several priors were to be found and generally at least two. Thus we find the terms *prior, sub-prior, tertius prior, quartus prior, quintus prior*. The first prior was sometimes called *prior major*, sometimes *prior clausularis*. Occasionally both titles are found in one house, the latter ranking below the former. The first prior acted as vicar in all matters in the absence of the abbot, and was generally charged with the details of the discipline of the monastery. With the foundation of the order of Cluny in the 10th century there appeared the *conventual prior* who ruled as head of a monastery, but was subject in some degree to the *archiabbes* of the mother-house of Cluny. The Regular Canons later gave this title of prior to the heads of their houses, as did also the Carthusians and the Dominicans. It was in houses of these orders that the sub-prior became a regular official. Among the Dominicans the head of a province is known as the *prior provincial*. In the order of St John of Jerusalem (q.v.) a *priory* was a group of commanderies ruled by a *grand prior*.

The term *prior* was applied also in the middle ages in a very general manner. Thus there was the *prior scholae* or leader of the choir, *prior scrinioriorum*, &c.

**PRISCIAN** [Priscianus Caesarenensis], the celebrated Latin grammarian, lived about A.D. 500, i.e. somewhat before Justinian. This is shown by the facts that he addressed to Anastasius, emperor of the East (491-518), a laudatory poem, and that the MSS. of his *Institutiones grammaticæ* contain a subscription to the effect that the work was copied (526, 527) by Flavius Theodorus, a clerk in the imperial secretariat. Three minor treatises are dedicated to Symmachus (the father-in-law of Boëtius). Cassiodorus, writing in the ninety-third year of his age (560? 572?), heads some extracts from Priscian with the statement that he taught at Constantinople in his (Cassiodorus's) time (Keil, *Gr. Lat. vil. 207*). His title *Caesarenensis* points, according to Niebuhr and others, to Caesarea in Mauretania. Priscian, however, Theodorus, who also wrote an *Institutiones aris grammaticæ*. Priscian was quoted by several writers in Britain of the 8th century—Alcuin, Bede, Alcuin—and was abridged or largely used in the next century by Hrabanus Maurus of Fulda and Servatus Lupus of Ferrières. There is hardly a library in Europe that did not and does not contain a copy of his great work, and there are about a thousand MSS. of it. The greater part of these contain only books i.-xvi. (sometimes called *Priscianus major*); a few contain (with the three books *Ad Symmachum*) books xvii., xviii. (*Priscianus minor*); and a few contain both parts. The earliest MSS. are of the 9th century, though a few fragments are somewhat earlier. All are ultimately derived from the copy made by Theodorus. The first printed edition was in 1470 at Venice.

The *Institutiones grammaticæ* is a systematic exposition of Latin grammar, dedicated to Julian, consul and patrician, whom some have identified with the author of a well-known epitome of Justinian's *Novææ*, but the lawyer appears to be somewhat later than Priscian. It is divided into eighteen books, of which the first sixteen deal mainly with sounds, word-formation and inflexions; the last two, which form from a fourth to a third of the whole work, deal with syntax. Priscian informs us in his preface that he has translated into Latin such precepts of the Greeks Herodian and Apollonius as seemed suitable, and added to them from Latin grammarians. He has preserved to us numerous fragments which would otherwise have been lost, e.g. from Ennius, Pacuvius, Accius, Lucretius, Catu and Varro. But the authors whom he quotes most frequently are Virgil, and, next to him, Terence, Cicero, Plautus; then Lucret, Horace, Juvenal, Pallust, Statius, Ovid, Livy and Persius. His industry in collecting forms and examples is both great and methodical. His style is somewhat heavy, but sensitive and clear; it is free, not of course from usages of Late Latin, but from anything that can be called barbarism. Its defects may be referred in the main to four heads. (1) Priscian avowedly treats Greek writers on (Greek) grammar as his supreme authorities; and bears too little in mind that each has a history of his own and is a law to itself. (2) There had been no scientific study of phonetics, and consequently the changes and combinations of languages are treated in a mechanical way: e.g. *i* passes into *a*, as *genuis*, *generis*, *generatum*; *o* as *savi*, *saxosus*; *g* passes into *s* as *torqueor*, *torsi*, &c. (3) The resolution of a word into root and stem and inflexional or derivative affixes was an idea wholly unknown, and the rules of formation are often based on unimportant phenomena; e.g. *Venus*, like other names ending in *us*, ought to have genitive *Veni*, but, as this was carried for a token, it has *Veneris*. *Ador* has no genitive because two rules conflict; for neutrals in or have a short penult (e.g. *aegor*, *aegoris*), and *ador*, from which it is derived, has a long penult. (4) The practical meaning of the inflexion is not realized, and syntactical usages are treated as if they were arbitrary or accidental associations. Thus, after laying down as a general rule for declinable words, that when they refer to one and the same person, they must have the same case, gender and number, Priscian adds that when there are transitive words we may use different numbers, as *docemus*, *doceamus*, *docemus disciplum*. He often states a rule too broadly or narrowly, and then, as it were, gropes after restrictions and extensions.

His etymologies are of course sometimes very wild: e.g. *caeleb* from *caelestium vitam ducen*; *b* being put for consonantal *u* because a consonant cannot be put before another consonant; *deterior* from the verb *deter*, *deter*; *potior* (adj.) from *potior*, *poliris*; *arbor* from *robur*; *verbum* from *verberatus aeris*, &c. Nor is he always right in Greek usages. Priscian's three short treatises dedicated to Symmachus are on weights and measures, the metres of Terence, and some rhetorical elements (exercices translated from the *Progymnasmata* of Hermogenes). He also wrote *De nomine, pronomino, et verbo* (an abridgment of part of his *Institutiones*), and an interesting specimen of the school teaching of grammar in the shape of complete parsing by question and answer of the first twelve lines of Homer's *Iliad* (Partilei XII., versuum Aristod. principalium). The metre *Caesarii* is a first-syllable rhyme which is scanned, and each word thoroughly and instructively examined. A treatise on accents is ascribed to Priscian, but is rejected by modern writers on the ground of matter and language. He also wrote two poems, not in any way remarkable, viz. a panegyric on Anastasius in 312 hexameters with a short iambic introduction, and a faithful translation into 1087 hexameters of Dionysius's *Periplus* or geographical survey of the world.

**PRISCILLIAN** (d. 382), Spanish theologian and the founder of a party which, in spite of severe persecution for heresy, continued to exist in Spain and in Gaul until after the middle of the 6th century. He was a wealthy layman who had devoted his life to a study of the occult sciences and the deeper problems of philosophy. He was largely a mystic and regarded the Christian
PRISCUS—PRISON

life as continual intercourse with God. His favourite idea is that which St Paul had expressed in the words "Know ye not that ye are the temple of God?" and he argued that to make himself a fit habitation for the divine a man must, besides holding the Catholic faith and doing works of love, renounce marriage and earthly honour, and practise a hard asceticism. It was on the question of continence in, if not renunciation of, marriage, that he came into conflict with the authorities. Priscillian and his sympathizers, who were organized into bands of spirites and abstinentes, like the Cathari of later days, indignantly refused the compromise which by this time the Church had established in the matter (see MARRIAGE: Canon Law). This explains the charge of Manicheaism levelled against Priscillian (Jerome, for his talk of the Sordes nuptiarum, had been similarly accused, and to escape popular indignation had retired to Bethlehem,)

and to this was added the accusation of magic and licentious orgies. Among the more prominent of Priscillian's friends were two bishops, named Instantius and Salvianus, and Hyginus of Cordova also joined the party; but through the exertions of Idacius of Emerita, the leading Priscillianists, who had failed to appear before the synod of Spanish and Aquitanian bishops to which they had been summoned, were excommunicated at Saragossa in October 380. Meanwhile, however, Priscillian was made bishop of Avila, and the orthodox party found it necessary to appeal to the emperor (Gratian), who issued an edict threatening the sectarian leaders with banishment. Priscillian, Instantius and Salvianus succeeded, however, in procuring the withdrawal of Gratian's edict, and the attempted arrest of Ithacius of Ossonoba. On the murder of Gratian and accession of Maximus (383) Ithacius fled to Treves, and in consequence of his representations a synod was held (384) at Bordeaux, where Instantius was deposed. Priscillian appealed to the emperor, with the unexpected result that with six of his companions he was burned alive at Treves in 385. The first instance of the application of the Theodosian law against heretics had the appellation of the synod which met at Treves in the same year; but Ambrose of Milan and Martin of Tours can claim the glory of having in some measure stayed the hand of persecution. The heresy, notwithstanding the severe measures taken against it, continued to spread in France as well as in Spain; in 412 Lazarus, bishop of Aix in Provence, and Herod, bishop of Arles, were expelled from their sees on a charge of Manicheaism. Proculus, the metropolitan of Marseilles, and the metropolitans of Vienne and Narbonensis Secunda were also followers of the rigorous tradition for which Priscillian had died. Something was done for its repression by a synod held by Turibius of Astorga in 446, and by that of Toledo in 447; as an openly proscribed creed it wholly disappeared after the second synod of Braga in 563. "The official church," says F. C. Conybeare, "had to respect the ascetic spirit to the extent of enjoining celibacy upon its priests, and of recognizing, or rather insuring, such of the laity as desired to live out the old ascetic ideal. But the official teaching of Rome would not now allow it to be an ideal and a duty for every Christian. Priscillian persisted for insisting that it was such; and seven centuries later the Church began to burn the Cathari by thousands because they took a similar view of the Christian life."

The long prevalent estimation of Priscillian as a heretic and Manichea styled upon Augustine, Turibius of Astorga, Leo the Great and Orosius, although at the Council of Toledo in 400, fifteen years after Priscillian's death, when his case was reviewed, the most serious charge that could be brought was the error of language involved in rendering gypermios by inasmobilitis. It was long thought that all the writings of the "heretic" himself had perished, but in 1885, G. Scheppe discovered at Würzburg eleven genuine tracts, since published in the Vienna Corpus. "They contain nothing that is not orthodox and commonplace, nothing that Jerome might not have written," and go far to justify the description of Priscillian as "the first martyr by a Spanish Inquisition."

See E. Ch. Babut, Priscillan et le Priscillanisme (Paris, 1900).

(A. J. G.)

PRISCUS, of Panium in Thrace, Greek scholar and historian, lived during the 5th century A.D. He accompanied Maximin, the ambassador of Theodosius the Younger, to the court of Attila (448). During the reign of Marcian (450-457) he also took part in missions to Arabia and the Egyptian Thebaïd. Priscus was the author of an historical work in eight books (Byzantīk hērōïsthis), probably from the accession of Attila to that of Zeno (433-447). Only fragments of the work remain, but the description of Attila and his court and the account of the reception of the Roman ambassadors is a most valuable piece of contemporary history. Priscus's style is pure, and his impartiality and trustworthiness entitle him to an honourable place among the writers of his time.

Fragments and life in C. W. Müller, Fragmenta historiorm græcorum, iv, 89-110; v, 24-26, ed. B. G. Niebuhr in Bonn. Corpus scriptorum hist. byzantinæ (1829), vol. vii, and L. Dindorf in Historici græci minores (1870), vol. i. For the embassy to Attila see Gibbon, Decline and Fall, ch. 34.

PRISCUS, a Greek Neoplatonist philosopher, of the school of Iamblichus and Aedesius. He died about the year 398 at the age of ninety. The emperor Julian frequently invited him to court on the strength of his reputation in connexion with theurgy. Eunapius says that he was a man of dignified and austere habit. Unlike Maximus, he used his influence over Julian with great moderation. He died during the Gothic invasion of Spain (506-508). He is important partly as maintaining the best traditions of philosophy during a period when Neoplatonism as a whole was a parasite of imperial power, and partly as being a connecting link between Iamblichus and Plutarch of Athens.

See Zeller's Hist. of Greek Phil.

PRISTHINA, PRICHITA, or PRISTINA, the chief town of a sanjak in the vilayet of Kossovo, Albania, European Turkey; on a small tributary of the river Situfita, an affluent of the Ibar, and 3 m. E. of the Prishtina station on the Salonica-Mitrovitsa railway. Pop. (1905), about 11,000. Prishtina is the seat of a governor-general and of a general of division, and possesses many mosques, a military hospital and a higher class school. The trade is considerable, the exports including chrome, wheat, maize, barley, skins, wine and timber from the magnificent beech forests in the sanjak. The plain of Kossovo (Kossovo polje, "Field of Blackbirds"), to the west, was the scene of the battle in which the Servian empire was destroyed by the Turks in 1389. To the south-east lies the partly ruined monastery of Grachatina founded by King Milutin of Servia (1275-1321). Among the frescoes are a remarkable head of Christ in the dome, and portraits of the founder and his queen Simida, daughter of Andronicus II. Palaeologus.

See G. M. M. Mackenzie and A. P. Irby, Travels in the Slavonic Provinces of Turkey (1877).

PRISM (Gr. πρίσμα, properly a thing sawn, παξαίνω, to saw), in geometry a solid enclosed by plane surfaces, two of which, termed the ends, are parallel, equal, similar and similarly situated polygons, and the faces connecting the ends are parallelograms, equal in number to the sides of the polygon. If the faces be perpendicular to the ends the prism is a "right prism," and the faces are rectangles; otherwise the prism is "oblique." The axis is the line joining the centres of the ends. It may be generated by moving a plane (corresponding to an end or base) parallel to itself. A prismoid differs from a prism in having for its ends two dissimilar parallel figures. For illustrations see CRYSTALLOGRAPHY, and for the mensuration see that article. In optics the word denotes a triangular prism, i.e. one having a triangle for base, used to decompose white light. (See REFRACTION AND DISPERSION.)

PRISON (derived through the Fr. from the Lat. præhenœsés, seizure), a place for the confinement or compulsory restraint of
persons after arrest or sentence by arbitrary authority or process of law.

The earliest object sought in imprisonment was to secure the person of the accused to ensure his appearance before his judges for trial, and after conviction to produce him to take his punishment. They were applied to other uses less justifiable or defensible; they served to execute the will of the despotic master upon all who set themselves in opposition to his authority, or were decreed, more or less wisely but still arbitrarily, by a government in the best interests of society, organized for the general good. Coercion and intimidation slowly came to be leading ideas, the infliction of a lesser penalty than the capital. The deprivation of liberty under irksome circumstances, rough lodging, hard fare and perpetual labour was after all a milder measure than death, although long years elapsed before the prison was so used. Penal codes depended rather upon shorter and more cruel methods; the scaffold was in constant use, with all manner of physical pain, torture before and after sentence, shameful exposure, hideous mutilation, exile, selling into bondage as slaves. Incarceration was no doubt practised by irresponsible masters, regardless of personal rights, callous to the sufferings of their victims, to which death by starvation or horrible neglect was a welcome relief. But consignment to a prison for lengthened periods was, as a penalty, of more recent introduction, and of still later date is the recognition of the duties incumbent upon the authority to use its powers mercifully by humane endeavours to reform and improve those on whom it laid hands.

The progress made can only be realized by considering what prisons once were. The shocking picture drawn by John Howard of the state of prisons at the latter end of the 18th century will last for all time. They were for the most part pestiferous dens, overcrowded, dark, foully dirty, not only ill ventilated, but deprived altogether of fresh air. The wretched inmates were dependent for food upon the caprice of their gaolers or the charity of the benevolent; water was denied them except in the scantiest proportions; their only bedding was putrid straw. Every one in durance, whether tried or untried, was heavily ironed. All alike were subject to the rapacity of their gaolers and the extortions of their fellows. Gaol fees were levied ruthlessly—"garnish" also, the tax or contribution paid by each individual to a common fund to be spent by the whole body, generally in drink. Idleness, drunkenness, vicious intercourse, sickness, starvation, squalor, cruelty, chains, awful oppression and everywhere culpable neglect—in these words may be summed up the state of the gaols at the time of Howard's visitation.

At this time prisons were primarily places of detention, not of punishment, peopled by accused persons, still innocent in the eyes of the law, and debtors guilty only of breaches of the financial rules of a commercial country, framed chiefly in the interest of the creditor. Freedom from arrest was guaranteed by Magna Carta, save on a criminal charge, yet thousands were committed to gaol on legal fictions and detained indefinitely for costs far in excess of the original debt. The impecunious were locked up and deprived of all hope of earning means to obtain enlargement; while their families and persons dependent on them shared their imprisonment and added to the overcrowding. The prisons were always full. Gaol deliveries were of rare occurrence, even when tardy trial ended in acquittal release was delayed until illegal charges in the way of fees had been satisfied.

In the article DEPORTATION it is shown how the discoveries in the southern seas led to the adoption of penal exile in preference to other suggested improvements in the English penal system. The penalitentiary scheme proposed by Howard was not, however, abandoned. It was revised and kept alive by Jeremy Bentham in his fanatical scheme for a "panopticon or inspection house," described as "a circular building, an iron cage glazed, a glass lantern as large as Ranelagh, with the cells on the outer circumference." His plan was to keep every inmate of every cell under constant close observation, and all were to be reformed by solitude and seclusion while constantly employed in remunerative labour, in the profits of which they were to share. The scheme hung fire, owing, it was alleged, to the personal hostility of George III. to Bentham as an advanced radical. Lands were, however, purchased which were eventually taken over by the government and utilized for the erection of Millbank penitentiary, begun in 1813 and partially completed in 1816. It was now fully recognized that the reformation of prisoners could best be attempted by seclusion, "employment and religious instruction." Millbank, as a new and most enlightened undertaking in prison affairs, was opened with much éclat. It was to be governed by a specially appointed committee of distinguished personages, the chairman being the Speaker of the House of Commons. The sum total expended upon the buildings amounted to half a million of money, and the yearly charges of the establishment were a heavy burden on the exchequer.

The erection of Millbank was a step in the right direction. The energy with which it was undertaken was the more remarkable because elsewhere throughout the United Kingdom the prisons, with few exceptions, remained deplorably bad. J. Neild, who in 1812 followed in the footsteps of John Howard, found that the old conditions remained unchanged. "The great reformation produced by Howard," to use Neild's own words, "was merely temporary...prisons were relapsing into their former horrid state of privation, filthiness, severity and neglect." Yet the legislature was alive to the need for prison reform. Besides the building of Millbank it had promulgated many acts for the amelioration of prisoners. Gaol fees were once more distinctly abolished; the appointment of chaplains was insisted upon, and the erection of improved prison buildings was rendered imperative upon local authorities. But these, with other and much older acts, remained in abeyance. Thus an act which provided for the classification of prisoners had remained a dead letter; even the separation of the males from the females was not a universal rule. Roused by these crying evils, a small band of earnest men formed themselves into an association for the improvement of prison discipline. They perambulated the country inspecting the prisons; they issued lengthy interrogatories to prison officials; they published periodical reports giving the result of their inquiries, with their views on the true principles of prison management, and much sound advice, accompanied by elaborate plans on the subject of prison construction. The labours of this society brought out into strong relief the naked deformity of the bulk of the British gaols. Speaking of St Albans from his personal observation Mr (afterwards Sir T. F.) Buxton, a most active member of the society, said: All were in ill health; almost all were in rags; almost all were filthy in the extreme. The state of the prison, the desperation of the prisoners, broadly hinted in their conversation and plainly expressed in their conduct, the uproar of oaths, complaints and obscenity, the indescribable stench, presented together a concentration of the utmost misery and the utmost guilt. The reports of the society laid bare the existence of similar horrors in numbers of other gaols. Yet this was in 1818, when the legislature was setting a praiseworthy example—when half a million had been spent in providing large airy cells for a thousand prisoners. Even in London itself, within easy reach of the palatial Millbank penitentiary, the chief prison of the city, Newgate, was in a disgraceful condition. This had been exposed by a parliamentary inquiry as far back as 1814, but nothing had been done to remedy the evils laid bare. The state of the female side had already attracted the attention of that devoted woman, Mrs Fry, whose ministrations and wonderful success in prison reform, if they did not bring about, the formation of the Prison Society. Mrs Fry went first to Newgate in 1813, but only as a casual visitor. It was not until 1817 that she entered upon the noble work with which her name will ever be associated. She worked a miracle there in an incredibly short space of time. The ward into which she penetrated was like a den of wild beasts; it was filled with women unsexed, fighting, swearing, dancing, gaming, yelling and justly deserved its name of "hell above ground." Within a month it was transformed.
and presented, says an eyewitness, "a scene where stillness and propriety reigned." The wild beasts were tamed. Movements similar to that which Mrs Fry headed were soon set on foot both in England and on the Continent, and public attention was generally directed to the urgent necessity for prison reform.

Stimulated by the success achieved by Mrs Fry, the Prison Discipline Society continued its labours. Hostile critics were not wanting; many voices were raised in protest against the ultra-humanitarianism which sought to make gaols too comfortable and tended to pamper criminals. But the society pursued its objects, undeterred by sarcasm. Many of these are now accepted as axioms in prison treatment; for instance, that female officers only should have charge of female prisoners, that prisoners of both sexes should be kept apart and constantly employed. Yet these principles were unacknowledged at that time and were first enunciated in acts such as the 4 Geo. IV. c. 65 and the 5 Geo. IV. c. 85 (1823-1824), the passing of which was mainly due to the strenuous exertions of the Prison Discipline Society. It was laid down in these that over and above safe custody it was essential to preserve health, improve morals, and enforce hard labour on all prisoners sentenced to it. Irons were strictly forbidden except in cases of "urgent and absolute necessity," and it was ruled that every prisoner should have a bed to himself—if possible a separate cell, the last being the first formal statement of a principle upon which all future prison discipline was to be based.

The importance of these acts cannot be over-estimated as supplying a legal standard of efficiency by which all prisons could be measured. Still the progress of improvement was extremely slow, and the managers of gaols still evaded or ignored the acts. Many local authorities grudged the money to rebuild or enlarge their gaols; others varied much in their interpretation of the rules as to hard labour and the hours of employment. One great drawback to general reform was that a large number of small prisons lay beyond the reach of the laws. Those under sanae and decisions in the boroughs and under the petty borrows of bodies continued subject to the strongest reprobation, and thus remained until they were swept away by the measure which brought about the reform of the municipal corporations in 1835. But by this time a still more determined effort had been made to establish some uniform and improved system of prison discipline. In 1831 a select committee of the House of Commons went into the whole subject of secondary punishment and reported that, as the difficulties in the way of an effective classification of prisoners were insurmountable, they were strongly in favour of the confinement of prisoners in separate cells, recommending that the whole of the prisons should be altered accordingly and the expense borne by the public exchequer. There can be little doubt that this committee was greatly struck by the superior methods of prison discipline pursued in the United States. The best American prisons had recently been visited by two eminent Frenchmen, J. A. de Beaumont and A. de Tocqueville, who spoke of it in the most eulogistic terms. It was with the object of appropriating what was best in the American system that Mr W. Crawford was despatched across the Atlantic on a special mission of inquiry. His exhaustive report, published in 1834, was a valuable contribution to the whole question of penal discipline. Another select committee, this time of the House of Lords, returned to the subject in 1835, and after a long investigation re-enunciated the theory that all prisoners should be kept separate from one another. It also urged in strong terms the necessity for one uniform system of treatment, more especially as regard dietaries, labour and education, and strongly recommended the appointment of official inspectors to enforce obedience to the acts. These recommendations were eventually adopted and formed the basis of a new departure.

For fifty years transportation (see DEPORTATION) had been in England the principal form of secondary punishment for crime. Primary or capital punishment still existed, but to a greatly modified extent. The pious Quakers of Pennsylvania at the end of the 18th century had realized a deeper duty towards the offenders than their extinction, and sought to amend and reform the living. The note struck first in the Walnut Street penitentiary began a new era in prison treatment, and the methods adopted were destined to extend over the whole world. This was the germ of the nearly universal principle of individual confinement, and the origin of what some advanced thinkers have denounced as the greatest crime of the present age, the invention of the separate cell. It was and still is held by many that the criminal may be best and most effectually weaned from his evil ways by shutting him up for lengthy periods between four walls, and subjecting him, when most susceptible, to curative processes, to constant exhortation and searching introspection, changing his nature and restoring him to society a reformed man.

It must be at once admitted that the system of isolation has produced no remarkable results. Solitary confinement has neither conquered nor appreciably diminished crime, even where it has been applied with extreme care, as in Belgium, and more recently in France, where it obtains strict and unbroken for long terms of years. Cloistered seclusion is an artificial condition quite at variance with human instincts and habits, and the treatment, long continued, has proved injurious to health, inducing mental breakdown. A slow death may be defended indeed on moral grounds if regeneration has been compassed, but it is only another form of capital punishment. Still the measures introduced in the United States and the action taken upon them fill a large page in prison history and must be recorded here.

Several states in the Union followed the lead of Pennsylvania. That of New York built the great Auburn penitentiary in 1816 to carry out the new principles. There every prisoner was kept continuously in complete isolation. He saw no one, spoke to no one, and did no work. Within a short period very deplorable results began to show themselves. Many prisoners became insane; health was generally impaired and life greatly endangered. Mr Crawford, whose mission to the United States has already referred to, was in favour of solitary confinement, but he could not deny that several cases of suicide followed this isolation. Some relaxation of the disastrous severity seemed desirable, and out of this grew the second great system, which was presently introduced at Auburn and afterwards at the no less renowned prison of Sing Sing. It was called the silent system. While the prisoners were still separated at night or meals, they were suffered to labour in association, but under a rule of silence ruthlessly and rigorously maintained. The latter, entrusted to irresponsible subordinates, degenerated into a despotism which brought the system into great discredit. All discipline officers were permitted to wield the whip summarily and without the slightest check. Under such a system the most frightful excesses were possible and many cases of brutal cruelty were laid bare. Reviewing the merits and demerits of each system, Mr Crawford gave his adhesion to that of varying solitude as pursued in the Eastern penitentiary in Pennsylvania.

Mr Crawford came back from the United States an ardent champion of the solitary system. He saw, however, great difficulties in making this the universal rule, chief among which was the enormous expense of providing suitable prisons. Some modification of the rule of unbroken solitude would be inevitable; but he strongly urged its adoption for certain classes, and he was equally convinced of the imperative necessity for giving every prisoner a separate sleeping cell. It is clear that the government endorsed Mr Crawford’s views. Where it was possible they gave effect to them at once. At Millbank, with its spacious solitary cells, the rule of seclusion was more and more strictly enforced. Ere long permissive legislation strove to disseminate the new principles. In 1830 Lord John Russell had given it as his opinion that cellular separation was desirable in all prisons. But it was not until 1839 that an act was passed which laid it down that individuals might be confined separately in single cells. Even now the executive did not insist upon the construction of prisons on a new plan. It only set a good example
by undertaking the erection of one which should serve as a model for the whole country. In 1840 the first stone of Pentonville prison was laid, and after three years of considerable outlay, its cells, 520 in number, were occupied on the solitary, or more exactly the separate system—the latter being somewhat less rigorous and irksome in its restraints. To the credit of many local jurisdictions, they speedily followed the lead of the central authority. Within half a dozen years no fewer than fifty-four new prisons were built on the Pentonville plan, which now began to serve generally as a "model" for imitation, not in England alone, but all over the world. Sir Joshua Jebb, who presided over its erection, may fairly claim indeed to be the author and originator of modern prison architecture.

The building of Pentonville was epoch-making. The modern prison dates from it. The penal discipline of to-day, much modified and varied it is true, may be largely traced to it. The "cell" scheme of individual separation holds the ground, and countries which could afford the outlay have built or are building cellular prisons. France has made steady progress in this respect. Great additions have been made to La Santé prison in Paris, and a new prison on gigantic lines has been opened at Fresnes les Rungis, on the outskirts of the metropolis, to replace the obsolete Mazas, and to give cellular accommodation to the large numbers always on hand in Paris. Germany has embarked on penitentiary reforms with the provision of several new prisons; it is the same with the United States, Austria, Holland, Spain, Portugal, Denmark, Norway, Sweden. In Italy a comprehensive scheme has been drawn up so that cellular imprisonment may become a general rule. In Belgium, where penal administration has received the closest attention for a number of years, the régime of cellular imprisonment has been long carried to its farthest limits, and solitary confinement ranging over ten years and in some cases much more has been strictly enforced. Of late years however a new school has arisen in Belgium in the advocates of the scheme of limited solitary accommodation. In England, moreover, which, if not the first to adopt separation in principle, certainly gave the largest effect to it in practice, continuous cellular confinement for short terms is ceasing to be the inevitable rule; and although it has been retained in cases of penal servitude for the first six months, it was in 1890 practically abandoned for lesser sentences, and all prisoners after the first month work together in association under surveillance. In July 1910 the home secretary announced his intention to reduce it to one month in all cases, except those of recidivists (see RECIDIVISM). The bias of modern practice, in short, is towards milder methods, not only in treatment, but in those anticipatory processes which may render imprisonment unnecessary.

To understand the existing British prison system it is necessary to consider its gradual growth and the steps taken to establish it. Its foundations were laid by Sir George Grey, a Roman Catholic, who had been secretary of state for the penitentiary; when transportation ended rather abruptly by the refusal of the chief colonists to continue to be the dumping ground for British convicts. Sir George Grey sought to deal with the difficulty as a whole, and to provide for all classes of criminals, the most heinous deserving severe correction and the minor offenders in the earliest stages of misconduct. For the first there was some urgency, the latter was still the business of the local jurisdictions. The system now introduced consisted of three principal parts: (1) of a limited period of separate confinement in a home prison or penitentiary, accompanied by industrial employment and moral training; (2) of hard labour at some public works prison either at home or abroad; and (3) of exile to a colony with a conditional pardon or ticket-of-leave (q.v.). No pains were spared to give effect to this plan. Pentonville was available for the first phase; Millbank was also pressed into the service, and accommodation was hired in some of the best provincial prisons, as at Wakefield and Leicester. Few facilities existed for carrying out the second stage, but they were speedily improvised. Although the hulks at home had been condemned, convict establishments in which these floating prisons still formed the principal part were organized at Bermuda and Gibraltar. Neither of these was a conspicuous success; they were too remote for effective supervision; and although they lingered on for some years they were finally abolished. The chief efforts of the authorities were directed to the formation of public works prisons at home, and here the most satisfactory results were soon obtained. The construction of a harbour of refuge at Portland had been recommended in 1845; in 1847 an act was passed to facilitate the purchase of land there, and a sum of money was taken in the estimates for the erection of a prison which was begun next year. At another point, Dartmoor, a prison already stood available, although it had not been occupied since the last war, when ten thousand French and American prisoners had been incarcerated in it. A little reconstruction made Dartmoor into a modern gaol, and in the waste lands around there was ample labour for any number of convict hands. Dartmoor was opened in 1850; two years later a convict prison was established at Portsmouth in connexion with the dockyard, and another of the same class at Chatham in 1856. The third stage in Sir George Grey's scheme contemplated the enforced emigration of released convicts, whom the discipline of separation and public works was supposed to have purified and purified, and who would have better hopes of entering on a new career of honest industry in a new country than when thrown back among vicious associations at home. The theory was good, the practice impossible. No colony would receive these ticket-of-leave men. Van Diemen's Land positively refused to do so, even though this denial cut off the supply of labour, now urgently needed. The appearance of a convict ship at the Cape of Good Hope nearly produced a revolt. Although Earl Grey addressed a circular letter to all colonial governments offering them the questionable boon of transportation, only one, the comparatively new colony of Western Australia, accepted. But this single receptacle could not have received more than a few hundred convicts each year, for it was too small an area. It became necessary therefore to find some other means for their disposal. Accordingly, in 1853 the first Penal Servitude Act was passed, substituting certain shorter sentences of penal servitude for transportation. It was only just to abbreviate the terms; under the old sentence the transportee knew that if well conducted he would spend the greater part of it in comparative freedom. But although sentences were shortened it was not thought safe to surrender all control over the released convict; and he was only granted a ticket-of-leave for the unexpired portion of his original sentence. No effective supervision was maintained over these convicts at large. They speedily relapsed into crime; their numbers, as the years passed, became so great and their depredations so serious, especially in garrotte robberies, that a cry of indignation was raised against the system, which led to its arraignment before a select committee of the House of Commons in 1863.

Meanwhile prison discipline in the elementary stage, as inflicted on lesser offenders, was continually discussed. The subject was referred to many committees for inquiry, and it was shown that there was a lamentable want of uniformity in the enforcement of legal penalties. The processes and treatment varied with the localities. Dietaries differed, here too ample, there meagre to starvation. The amount of exercise allowed varied greatly; there was no universal rule as to employment. In some prisons hard labour was insisted upon, and embraced tread-wheels or the newly-invented cranks; in some it did not exist at all. The cells inhabited by prisoners (and separate cellular confinement was now very general) were of different dimensions—variously lighted, warmed and ventilated. The time spent in these cells was not invariably the same, and as yet no authoritative decision had been made between the solitary and silent systems. The first named had been tried at Pentonville, but the period had been greatly reduced. The duration had been at first fixed at eighteen months, but it was proved that the prisoners' minds had become enfeebled by this long isolation, and the period was limited to nine months. In many jurisdictions however the silent system, or that of associated
labour in silence, was still preferred; and there might be prisons within a short distance of each other at which two entirely different systems of discipline were in force. In 1849 Mr. Charles Pearson, M.P., moved for a select committee to report upon the best means of securing some uniform system which should be at once punitive, reformatory and self-supporting. He urged that all existing plans were ineflicacious, and he advocated a new scheme by which the labour of all prisoners should be applied to agriculture in distinct prisons. The result of a full inquiry was the reiteration of views already accepted in theory but not yet generally adopted in practice. Thirteen more years elapsed and still no such steps had been taken. A new committee sat in 1863, and in its report again remarked in no measured terms upon the many and wide differences that still existed in the gaols of Great Britain as regards construction, diet, labour and general discipline, "leading to an inequality, uncertainty and inefficiency of punishment productive of the most prejudicial results." Matters could only be mended by the exercise of legislative authority, and this came in the Prison Act of 1865, an act which consolidated all previous statutes on the subject of prison discipline, many of its provisions being still in force. Yet the years passed and uniformity was still far from secured; it was impossible indeed while prison administration was still left to a number of local authorities, no two of which were often of the same mind. The legislature had tried its best, but had failed. It had exercised some supervision through its inspectors, had forbidden cells to be used until duly certified as fit, and had threatened to withhold exchequer contributions from prisons of which unfavourable reports were received. Such penalties had exercised no sufficient terror. It began to be understood, moreover, that the prisons under local jurisdictions were not always conveniently and economically situated. Crime, with the many facilities offered for rapid locomotion to those who committed it, had ceased to be merely local, and the whole state rather than individual communities ought to be taxed; prison charges should be borne by the public exchequer and not by local rates. These considerations gained strength and led at length to the introduction of the Prison Bill which became law in 1877, by which the control of all gaols was vested in a body of prison commissioners appointed by and responsible to the home secretary. These commissioners had power to consolidate by closing superfluous prisons, to establish one system of discipline, and generally by watchful supervision, aided by the experience of specialists, to maintain that much-desired uniformity which had been so long and unsuccessfully sought. At the same time the co-operation of the local magistrates was invited so far as advice and assistance were concerned; but all real power and control has passed from their hands into that of the commissioners of prisons. The system established by the act of 1877 is that now in force.

As for penal servitude, the punishment reserved for the gravest offences, great changes have been introduced. We left this branch of the subject at a parliamentary inquiry. The verdict given was in the main satisfactory; but doubts were expressed as to the severity of the discipline inflicted, the principal features of which were moderate labour, ample diet and substantial gratuities. The first was far less than the work free men did for a livelihood, the second larger, the third excessive, so that convicts often left prisons with thirty, forty, even eighty pounds in their pockets. Penal servitude, to use the words of the lord chief justice Sir Alexander Cockburn, one of the members of the committee, "was hardly calculated to produce on the mind of the criminal that salutary dread of the recurrence of the punishment which may be the means of deterring him and, through his example, other from the commission of crime." The chief recommendation put forward to mend the system comprised lengthening of sentences, a diminution in the dietaries, the abolition of large gratuities, and, speaking broadly, a general tightening of the reina. The most notable change however was in regard to labour, the quantity and value of which was to be regulated in future by the so-called "mark-system." This plan had originated with Captain Maconochie, at one time superintendent in Norfolk Island, who had recommended that the punishment inflicted upon criminals should be calculated, not by time, but by the amount of labour actually performed. In support of his theory he devised an ingenious system of recording the convicts' daily industry by marks, which on reaching a given total would entitle them to their release. This mark system had already been tried with good results in Ireland, where the Irish system, as it was called, introduced by Sir Walter Crofton, had attracted widespread attention. There had been a very marked diminution in crime, attributable it was supposed to this system, which was in almost all respects the same as the English, although the Irish authorities had invented an "intermediate stage" in which convicts worked in a state of semi-freedom and thus practised the self-reliance which in many produced reform. As a matter of fact the diminution in crime was traceable to general causes, such as a general exodus by emigration, the introduction of a poor law and an increase in the facilities for earning an honest livelihood. It may be added here that judg by later experience the Irish system had no transcendent merits, and it is now extinct. But we owe something to the Irish practice which first popularized the idea of maintaining a strict supervision over convicts in a state of conditional release, and it reconciled us to a system which was long wrongfully stigmatized as espionage. The mark system, as recommended by the committee of 1863 and as subsequently introduced, had however little in common with either Maconochie's or the Irish plan. It was similar in principle and that was all. According to the committee, every convict should have it in his power to earn a remission—in other words, to shorten his sentence by his industry. This industry was to be measured by marks earned by hard labour at the public works, after a short probational term of close "separate" confinement. But the remission gained did not mean absolute release. All males were to be sent, during the latter part of their sentence, "without disguise to a thinly peopled colony," to work out their time and their own rehabilitation. The committee still clung to the old theory of transportation, and this in spite of the lively protests of some of its members. The one outlet remaining, however, that of Western Australia, was soon afterwards (1867) closed to convict emigrants; and this part of the committee's recommendations became a dead letter. Not so the mark system, or the plan of earning remission by steady industry. This was carried out on a broad and intelligent basis by officials prompt to avail themselves of the advantages it offered. Thus in 1877-1878 efforts were made to minimize contamination by segregating the worst criminals and restricting conversation at exercise. A special class was formed in 1880, in which all convicts "not versed in crime," first offenders and comparatively innocent men, are now kept apart from the older and more hardened criminals. The committee last quoted gave it as their opinion that "penal servitude as at present administered is on the whole satisfactory; it is effective as a punishment and free from serious abuses . . . a sentence of penal servitude is now generally an object of dread to the criminal population." Since then, steps have been taken in the classification of convicts when undergoing sentence with a view to dealing more effectually with habitual criminals.

Having thus traced the history of secondary punishments and prison discipline in England, it will be well to de-
his own food, see and communicate with his friends and legal adviser so as to procure fully for his defence. His fate after conviction depends on his sentence. If this be "imprisonment," so called to distinguish it from "penal servitude," although both mean deprivation of liberty and are closely akin, it is undergone in one of the "local" prisons—the prisons till 1878 under local jurisdiction, but now entirely controlled by the state through the home secretary and the commissioners of prisons. The régime undergone is cellular; able-bodied prisoners are kept in strict separation for at least a month, and during that time subjected to severe labour; although the term of first-class hard labour and of purely penal character no longer exists. The tread-wheel has also been abolished. A system of progressive stages based on the mark system has been adopted in the local prisons, and the prisoner's progress through each depends on his own industry and good conduct. During the first month he sleeps on a plank bed, a wooden frame raised from the floor, with bedding but without mattress. When he has earned the proper number of marks, which at the earliest cannot be until one month has elapsed, he passes into the second stage and is allowed better diet and a mattress twice a week. The third stage, at the end of the third month, gives him further privileges as regards diet and bed. The fourth stage concedes to the prisoner a mattress every night, and the privilege, if well conducted, to communicate by letter or through visits with his friends outside. These stages are applicable to females except as regards the plank bed; youths under sixteen and old men above sixty are also allowed mattresses. A small gratuity may be earned during the second and third following stages, amounting in the aggregate to ten shillings. The labour, too, may be industrial, and include instruction in tailoring, shoe-making, basket-making, bookbinding, printing, and many more handicrafts. Throughout the sentence the prisoner has the advantage of religious and moral instruction; he attends divine service regularly, and whatever his creed is visited by a chaplain. He is always getting, if he desires, that knowledge and gain which are necessary to his needs. His physical welfare is watched over by competent medical men; close attention is paid to the sanitary condition of prisons; strict rules govern the size of cells, with their lighting, warming and ventilation. Dietaries are everywhere the same; they are calculated with great nicety according to the time of day, and vary and ample nutrition without running into excess. In a word, as regards discipline, labour, treatment, exactly the same system obtains in the "local" prisons throughout the United Kingdom.

Where the sentence passes beyond two years it ceases to be styled imprisonment and becomes penal servitude, which may be inflicted for any period from three years to life. The prisoner becomes a convict and undergoes his penalty in one or more of the convict prisons. These are entirely under state management. A sentence of penal servitude as now administered consists of three distinct periods or stages: (1) that of seclusion endured in separate confinement in a so-called "close" prison; (2) a period of labour in association at a public works prison; and (3) conditional release for the unexpired portion of the sentence upon licence or ticket-of-leave.

1. In the first stage, which was limited to six months, but which it is proposed to reduce to one month, the convict passes his whole time in his cell apart from other prisoners, engaged at some industrial employment. He exercises and goes to chapel daily in the society of others, but holds no communication with them; his only intercourse with his fellow-creatures is when he is visited by the governor, chaplain, schoolmaster or trade instructor. This period of almost unbroken solitude is of a painful character, and its duration has therefore been wisely limited.

2. The second is a longer stage and endures for the whole or a greater part of the remainder of the sentence, its duration being governed by the power a convict holds in his own hands to earn a remission. It is now passed at a public works prison; either at Aylesbury (females), Borstal, Dartmoor, Parkhurst or Portland. While cellular separation, except at work, at prayers or exercise, is strictly maintained, labour is in association under the close and constant supervision of officials. Intercommunication no doubt takes place between the men working together in quarry, brickfield or barrow-run, and out of earshot of their guards, may and do converse at times. But the work is too arduous to allow of long and desultory conversation; the chance of contamination is now minimized by the careful separation of the less hardened from the old offenders. There is no reason to suppose that any great evils arise from this association, and without it the execution of the many important national public works which now attest its value would have been impossible. Among these may be mentioned the following: the quarrying of stone for the great Portland breakwater, nearly 2 m. in length and between 50 and 60 ft. deep in the sea, with the defensive works on the Verne, batteries, casemates and barracks intended to render the island of Portland impregnable, and the enlargement and extension of the dockyards at Chatham and Portsmouth. At Borstal a line of forts intended to protect Chatham on the south and west have been erected by convicts; they have also built magazines at Chattenden on the left bank of the Medway. Besides this, convict labour has been usefully employed in the erection of prison buildings at new points or in extension of those at the old. In all cases the bricks have been made, the stone quarried and dressed, the timber sawn, the iron cast, forged and wrought by the prisoners. The great merit of this system is the skill acquired in handicrafts by so many otherwise idle and useless hands. Convict mechanics are rarely found ready made. It is a fact that a large percentage of the total number employed at trades learnt them in prison. These results are no doubt greatly aided by the judicious stimulus given to the highest effort of the mark system. The chief objection to enforced labour has been the difficulty in ensuring this; but the convict nowadays eagerly tries his best, because only thus can he win privileges while in prison and an earlier release from it. Every convict labourer is rewarded according to the value of his work; upon the total earned depends his passage through the stages or classes which regulate his diet and general treatment, and more especially his interviews and communications with his relations and friends. Yet more; steady willing labour continuously performed will earn a remission of a fourth of the sentence. It must be borne in mind that the marks thus earned may be forfeited at any time by misconduct, but affect remission to this extent only. The full remission in a five years' sentence is one year and ninety-one days; in seven years, one year two hundred and seventy-three days; in fourteen, three years one hundred and ninety-seven days; in twenty, four years one hundred and ninety days. "Lifers" cannot claim any remission, but their cases are brought forward at the end of twenty years and then considered on their merits.

3. Having earned his remission the convict enters upon the third stage of his punishment. He is released, but only conditionally, on licence or ticket-of-leave. This permission to be at large may easily be forfeited by fresh breaches of the law. Stringent conditions are imposed on the licence and well known to every licence holder (see Ticket-of-Leave).

Further modifications have been introduced from time to time in the British penal system, tending mostly to milder discipline, more intelligent classification of prisoners and a certain amelioration of their lot. In its general outlines the system as set forth above has been maintained, but the departmental committee appointed in 1895 made some important recommendations which were presently adopted in part. The committee was dissatisfied with the moral results achieved and thought that more attention should be paid to reformatory processes. They believed that "few inmates left prison better than when they came in." Recriminals were frequent and recidivism on the increase. Imprisonment was not sufficiently deterrent to the habitual criminal class, and small attention was paid to the reclamation of less hardened offenders. The views of this committee were embodied in a Penal Servitude bill which was long debated, but became law in 1898. It
emphasized the excellence of the system devised in 1879 for the segregation of the comparatively innocent from convicts hardened in crime. The system of the "star" class as originally established provided that the prisoner never previously convicted should be kept absolutely apart, at chapel, labour, exercise and in quarters, from his less fortunate fellows who had already been imprisoned. The rule was strictly enforced and with the most conspicuous results, so that little more than 1% of "stars" have been re-convicted when once more at large. The privilege of the "star" only accorded after careful inquiry and reasonable proof that the individual has never before been sent to prison. Reference is made to the police at the time of conviction, and the duty of looking into previous and present character is very strictly performed. The inquiry is continuous and may be prolonged into the sentence; then, if necessary, correction is applied. But as a matter of fact very few mistakes are made. It is obvious that wrongful admission into the "star" class might be fraught with mischievous consequences, and it is well known that a first sentence does not necessarily mean absolute acquainurance with crime. For administrative convenience the "stars"—whose name comes from the scrap of crimson cloth worn on cap and jacket sleeve—be generally concentrated at Portland, and employed in labours specially allotted to them, for the most part demanding a higher rate of intelligence than the general average shown by convicts. Moulders, blacksmiths, carpenters, tinmiths, stonemasons, bookbinders, painters and various other trades and handicrafts are the peculiar province of the "stars."

The Prison Act of 1898 made some marked changes in penal discipline. One was the strict limitation of corporal punishment to offences of mutiny and gross personal violence to officers, where previously it might be inflicted for many forms of misconduct, and it can only now be adjudged under great restrictions.

It was feared that the removal of this powerful deterrent would adversely affect discipline, but on the contrary, the yearly average of prison offences has diminished from 147 to 137 per thousand prisoners, and it has been felt by the authorities that the limitation was salutary and wise. Another change was the power given to courts of law to differentiate between offenders by ordering them one of three classes of treatment ranging from severe to less rigorous. The first of these divisions was akin to that of former first-class misdemeanants; the second division was allotted to persons guilty of trivial offences not amounting to moral depravity, the third division was apportioned to serious crime calling for severe repression, involving strict separation for the first twenty-eight days with "hard labour" (now an obsolete expression, since all prison labour is nowadays accounted "hard"). The scheme was judicious, but courts have been slow to avail themselves of its provisions. Yet a third improvement was the permission conceded to prisoners locked up in default of payment of fine, to obtain a reduction of time proportionate to part payment of the fine. The numbers under both categories are considerable, and taken together show a steady increase in the ten years from 1892 (when the acts first came into effect) to 1902, the figures being 33,902 in 1892 and 51,302 in 1902.

Imprisonment, albeit somewhat modified and diluted, continues to be used as the chief penalty and most trusted panacea for all crime. The medicine is so simple in application and so easily available that it is served out almost automatically and indifferently to every law-breaker; the pickpocket and the burglar are locked up next door to the clergyman at variance with his bishop; the weak-kneed and self-indulgent drunkard rubs shoulders with the political zealot who has endangered the peace of nations. There is an enormous mass of so-called crime in England which is not crime at all, and still is perpetually penalized by the infliction of imprisonment for such short periods as to be perfectly futile. The bulk of the offences for which it is meted out are trivial and unimportant. Eighty-three per cent of the annual convictions, summarily and on indictment, followed by committal to gaol, are for misconduct that is distinctly non-criminal, such as breaches of municipal by-laws and police regulations, drunkenness, gaming and offences under the vagrancy acts. The leniency of the sentences indicates the comparatively trivial character of the wrongdoing. Forty per cent of the males and 39% of the females were sent to prison for periods of a week or less; on the other hand, no more than 4% were sentenced to six months and under, only 2% were imprisoned for terms between six months and one year; and 75% to more than one year. The question will arise some day whether it is really necessary to maintain fifty-six local prisons, with all their elaborate paraphernalia, their imposing buildings and expensive staff, to maintain discipline in daily life and insist upon the proper observance of customs and usages, many of them of purely modern invention. Of course there is in most cases the alternative of a fine, the non-payment of which entails the imprisonment; yet a penalty imposed on the pocket is so clearly the proper retribution for such misdeeds that better methods should be devised for the collection of fines.

The chief aim of penal legislation should indeed be either to keep gaols empty or to use them only where distinct reduction in the number of offenders, whether by regeneration or by continuous withdrawal from noxious activity, can be obtained. An axiom based upon this view has been formulated, and although paradoxical it may well be quoted here. The great aim and object of all penal processes, it has been said, should be the recognition of the general principle of dividing all offenders into two categories: (1) those who ought never to enter a gaol, and (2) those who ought never to be allowed to leave it.

Praiseworthy efforts to compass the first end have been made in recent legislation. The First Offenders Act in 1887 had the effect of postponing sentence and sparing these offenders from incarceration subject to their good conduct. An average of about 4500 thus escaped imprisonment in the five years between 1893 and 1897, and an average of 5500 the five following years. The gain in this was great, seeing that no more than 6 to 8% were actually sent to gaol after the commission of a second offence, and that there was therefore a very distinct saving in expense of maintenance of prisoners incarcerated.

The value of this act is to be seen in its wide adoption. It is in force in some of the states of the American Union. It was adopted in France by the Berenger law of 1891, and in Belgium, where 14% of sentences of imprisonment in one year and a-half were postponed. In some countries the concession has been accompanied by admonition. The Summary Jurisdiction Acts, by which large numbers of minor offenders were discharged on bail, or subjected to fines or very brief terms of imprisonment, have also tended to diminish the prison population enormously. The number annually discharged increased from 35,000 in 1893 to 51,302 in 1902. This excellent system has commended itself to many countries and it is now adopted by the bulk of governments and jurisdictions owing allegiance to the British Crown.

Two new systems of applying imprisonment have commended themselves to English administrators, and both have been effected by the Prevention of Crime Act 1908. The first is a new method for educating and reforming young offenders, already on the frontiers of habitual crime, no longer children, but at an age still susceptible of permanent improvement; the second is the legal acceptance of the principle of indefinite detention, the willingness to inflict an indeterminate sentence on those who have already forfeited the right to be at large.

Both these measures originated in the United States. The Borstal scheme of a juvenile-adult reformatory has been to some extent planned on the institutions of Elmira reformatory in the state of New York and of Concord in Massachusetts (see Juvenile Offenders). Side by side with the new processes introduced, the idea of the indeterminate sentence was started and put in practice, by which release was made to depend upon reasonable hope of amendment and sentences were prolonged until it was more or less certain that the treatment had resulted in cure.

Other measures are set forth in the new classification of convicts, prescribed by the secretary of state in the rules submitted by him to the House of Commons in 1904. All convicts
are classed in three categories, viz. (A) the Ordinary division; (B) the Habitual Offenders' division; and (C) the Long Sentence division.

The "A" or Ordinary division comprises all ordinary convicts under old rules who are still separated into the three classes of "star," intermediate and recidivist, as provided by the act of 1868. The qualifications for each class are clearly laid down. Only those never previously convicted, or known as of not habitually criminal or corrupt habits, are eligible for the "star" class. The intermediate class takes those not previously convicted but deemed unsuitable as "stars" from antecedents and generally unsatisfactory character. The recidivist class is for those previously sentenced to penal servitude or whose record shows them to have been guilty of grave and persistent crime.

These three classes begin with cellular confinement, but for varying periods; the first for three months, the second six months and the third for nine months, in all cases subject to a medical report upon mental and physical condition. Female convicts pass the first three months of their sentence in separate cells.

The "B" division indicates the worst penalties to be inflicted upon habitual criminals. There is no recognition whatever of the principle of the indeterminate sentence. The law merely prescribes the forfeiture of all remission. The convict is not eligible for release or licence, but when the time of conditional liberation would have formerly arrived the case is submitted to the authorities and dealt with on its merits. Early release depends upon the reports on industry and conduct, and the prospect of his keeping straight if set free. He may have to "do" his whole time but not an hour beyond it.

Certain privileges are conceded to the "B" division to compensate those in it for the loss of remission. They wear a special dress, a band of blue cloth on the left arm; they may earn an extra gratuity and spend a part of it in buying extra food or articles of comfort and relaxation; they may take their meals in association, converse at them or at exercise, but not at labour.

The "C" division has been designed for convicts serving long sentences, who have gained all possible privileges in the early years of sentence and have little or nothing to expect further until the last year of their sentence, when they may earn an additional gratuity. But after ten years they may enter the "C" division, earn a special gratuity therein, and enjoy the various privileges accorded to the "B" or habitual criminals' division with the additional advantage that there is no interference with their remission.

Still milder and more humanitarian prison treatment was that put forward by the home secretary in 1910 in his speech already referred to. In it he suggested that the following reforms should be carried out, some by administrative order and some by future legislation: (1) time for the payment of fines inflicted for minor offences; (2) disciplinary treatment of offenders under 21 years of age; (3) punishment of those guilty of offences not involving more than six months, to be relieved of all degrading terms; (4) the reduction of the period of solitary confinement to a maximum of one month; (5) the abolition of the ticket-of-leave system. It was also proposed to give four lectures a year in convict prisons.

Prisons in other Countries.—The general progress made in prison treatment will be best realized by a brief survey of penal institutions in the principal countries of the world. It will be convenient to take them alphabetically.

1. Austria.—The regime of cellular confinement has not been universally adopted; only six prisons are built on that principle and no more than 15% of the whole number of prisoners can be subjected to the system. Cellular separation is not inflicted for long periods, the minimum being six months and the maximum three years. The bulk of the prisoners live and labour in common. A great feature has been the execution of public works by prisoners in a state of semi-liberty beyond prison walls—the practical adoption of the so-called "Irish" or Intermediate prison—and good results are seen in road-making and the improvement of river courses.

2. Belgium.—This country has spared neither pains nor money in carrying out penal processes, and the Belgian prisons are examples of the cellular system prolonged to the utmost limits of human endurance. There is a minimum of ten years, but the individual may elect to continue in separation, or be transferred to partial association. A new school of Belgian criminologists has been headed by M. Prins, the chief of the prison department, who has protested that to hope the vicious, hardened offender, after a long detention, will be reformed is the hope of a fool, and he will leave his cell regenerated, is a Utopian dream.

3. British Dominions beyond the Sea.—The principle of cellular separation was accepted as far back as 1836 and the model prison of Pentonville, opened in 1842, has since been copied throughout the Empire. The principle is that all British colonies with various modifications, and prisons built on modern principles are to be found in Canada, Australia, New Zealand and the Cape of Good Hope. India retains association as the system under which all for its very primitive classes, with other classes generally abandoned in Great Britain, such as the employment of well-conducted prisoners as auxiliaries in prison discipline and service; deportation is still the penalty for the worst offences and is carried out on a large scale and with satisfactory results the Andaman Islands. In Egypt since the establishment of British control a very marked change has been introduced in prison affairs.

4. Denmark.—In Denmark all convicted prisoners pass through several stages, from cellular treatment to the intermediate prison and then to special cell大家可以按照要求作答。
PRISONERS’ BASE—PRITCHARD, C.

369

county gaols and the horrors of the convict lease system in the southern states, now nearly extinct; at the other such modern and well-equipped reformatories as Elmira and Concord (see Juvenile OFFENDERS). The worst feature is the indiscriminate association sometimes seen between the accused and the accused; even witnesses against whom there is no shadow of a charge are sometimes imprisoned among felons. Nor is it only in distant corners of the great continent that this criticism applies, though constantly occurring. The American system of confinement, which has been in practice for a short time since the local jail in the city of New York, “the Tombs,” a house of detention for prisoners awaiting trial, was described in an official report to the state legislature as “a disgrace, a blot upon humanity. It is an instrument of torture...” The administration of prisons remains with the various state authorities, and there is no federal or general system which would introduce uniformity of treatment. The federal government has no influence or control except for offences against the federal laws, regulating coinage, postal service, the revenue and, so forth. Prison management is essentially a local concern, but some general features are common to all states, such as the rule that while petty offenders and prisoners awaiting trial are under county and city jurisdiction, the state takes charge of all persons convicted of serious crimes. It is generally stated that the ratio of the proportion of the criminal population, more than half the general total being imprisoned therein. Some of them are models of cleanliness and good order, built on the best and most imposing lines with large commodious cell blocks and dungeons for the confinement of the most dangerous criminals. The desire of most prison administration is to develop industrial training and trade profits side by side with mildness of treatment. The latter sometimes lapses into methods which are not usually thought consistent with the principles of discipline, such as the permission to play on musical instruments, the holding of concerts, the privilege of smoking and chewing tobacco, of receiving baskets of provisions, novels and newspapers from friends outside.

It is worthy of note that prison architecture in the United States misses many of the gloomy features common to such constructions. The newest prisons are generally lighter, more roomy, better ventilated and on the whole more comfortable than even the best British prisons. To the modern public, the cell of a prison discipline, such as the permission to play on musical instruments, the holding of concerts, the privilege of smoking and chewing tobacco, of receiving baskets of provisions, novels and newspapers from friends outside, cannot be regarded as an outrage. Prisoners are not confined to a cell, the sunlight is admitted, the climate from extreme heat to cold many points below zero, is a considerable engineering triumph.

PRISON INDUSTRY.—It is an axiom in prison science that enforced labor should be provided for prisoners. Nevertheless, it was not until 1787 that Daniel Wilson, the noted Scottish prison reformer, in his treatise on the subject, stated that “the purity of the air and the cleanliness of the American prisons are admirable, and under a very elaborate system of warming by hot air, a regular and uniform temperature is sustained throughout the year, which considering the varying nature of climate from extreme heat to cold many points below zero, is a considerable engineering triumph.”

Prison Industries.—It is an axiom in prison science that enforced labor should be provided for prisoners. In the prison systems of Prussia and Austria, large tracts of land have been cultivated into cultivation, and watercourses have been diverted successfully despite serious difficulties, climatic and physical; in Russia convict labor has been carried on in connection with the Crimean railway; the military operations in the Sudan were greatly aided by convict laborers engaged in useful work at the base and all along the line. Italy passed a law in 1904 enacting outdoor labour for the rehabilitation of prisoners and was modeled on the British model. Sweden had no labor system for convicts until 1903 but has been largely curtailed for the open market and prison labor is restricted nowadays to supplying articles required for current use by public departments such as the army, navy, post office and, of course, the convict labor itself is not subject to the same competition. The best prison labor has been the manufacture of clothing, shoes and wearing apparel; it is not subject to the same competition. England has always been a market for prison labor and the trade originally invented by prison task-masters. The annual value of the labour applied in English prisons has varied. In 1817-18, the total annual amount spent in пенитенциальных работ was £428,260 for 1866-1867, as against £415,660 for 1903-1904. Figures are not available for any exact comparison of outlay and return in other countries, but the earnings in European countries generally run to about half of the cost of maintaining the prisoners. This is the extreme of making prisoners self-supporting and of having them idle, which is the whole weight of expense falls upon the state. In some European penal establishments the principal consideration is to have the prisoners carry on the work of the state, and hence labor associations have paralysed all prison industry. In the former, the management of the establishment, which by a contractor hires the prisoner’s labour from the state, has proved very profitable, but at the same time it has a disadvantage inasmuch as each enterprise is for the individual. This leasing-out system has been carried further in some of the southern states, and has produced the convict camp, which are much criticized and condemned from the harshness of the conditions, as there is an inducement to the management to extend the meagre results other than monetary that may have been obtained.

The modern movement in favour of industrial employment combined with humane and intelligent considerations has swept Europe and America. In 1905, the American Economic Association held a Convention on the subject and the results were published. Much has been written upon the subject, and much effort has been made to establish a system that would be beneficial to both the criminal and the public. In the United States, the movement has been led by A. D. Tappan, who has been a leader in the movement, and by other reformers. The movement has been slow, but steady, and has been partially successful. The results have been encouraging, and there is reason to hope that the movement will continue to gain ground.

The principal objections to the system of prison labor are that it is a source of corruption and that it tends to make the prisoner into a criminal. It is a source of corruption because it is a temptation to the prisoner to steal or cheat in order to get more work done. It tends to make the prisoner into a criminal because it is a source of irritation and discontent, and the prisoner is more likely to become a criminal if he is dissatisfied with his work. The movement has been slow, but steady, and has been partially successful. The results have been encouraging, and there is reason to hope that the movement will continue to gain ground.

The Report of the Royal Commission on Penal Servitude (1878-1879) was a landmark in the history of penal reform in England. It recommended the abolition of penal servitude, the introduction of penal colonies, and the establishment of a system of industrial training for convicts. The report was widely influential, and its recommendations were largely adopted by the government. The report was compiled by a commission of experts, including lawyers, doctors, and social reformers. The commission was appointed by the government, and its work was financed by a grant from the Treasury. The commission heard evidence from a wide range of sources, including prisoners, prison officers, and experts in the field of penal reform. The commission's report was published in 1879, and it was widely influential in shaping the future of penal policy in England.
PRITCHARD, H.—PRIVET

PRITCHARD, HANSAN (1711–1768), English actress, whose name before her early marriage— to an actor—was Vaughan, first attracted attention as a singer at Bartholomew’s Fair in 1733. She was soon playing a wide variety of parts, mostly comedy, at the Haymarket, Drury Lane and Covent Garden. When Garrick became patron of Drury Lane in 1747 she joined his company and played with him for twenty years, her last appearance being as Lady Macbeth—one of her greatest roles—in April 1768, a few months before her death. Her talents were highly thought of by the critics of the day. Her beauty, which had studied under Garrick, and whose beauty created a sensation when she made her début as “Miss Pritchard” in October 1756, did not live up to the expectations then raised. She married in 1762 the actor John Palmer, retired from the stage at the same time as her mother, and after her husband’s death married a political writer named Lloyd.

PRITTEWELL, a residential parish in the borough of Southend-on-Sea, and in the S.E. parliamentary division of Essex, England; lying 12 m. inland (N.N.W.) from Southend, with a station on the Southend branch of the Great Eastern railway. The church of St Mary the Virgin has fine Perpendicular work and traces of Norman work. There are fragments of a Cluniac priory of the 12th century. Pop. (1901), 27,242.

PRIVAS, a town of south-eastern France, capital of the department of Ardèche, 95 m. S. by W. of Lyons on a branch line of the railway from that city to Nîmes. Pop. (1906), town, 3,495; commune, 7000. Privas is situated near the Ouvèze, here joined by the Mezayon and Chazalon. The town is the seat of a prefecture, a court of assizes and a tribunal of first instance. Other institutions are training colleges for both sexes, a communal college and a lunatic asylum for the departments of Ardèche and Drôme. Silk-milling is carried on. The rearing of silk-worms and the cultivation of the mulberry are widespread industries. There are mines of iron ore in the vicinity. Trade is in silk, tanned leather, game, chestnuts and fruit preserves.

Privas is first heard of in the 12th century, as a possession of the counts of Valentinois, and subsequently became the seat of a separate barony. One of the strongholds of the Reformed Faith, it suffered terribly during the Wars of Religion. Ineffectually besieged by the royal troops in 1574, it passed in 1619, by the marriage of the heiress of the barony, Paule de Chambaud, into the possession of the vicomte de Lestrage, a Roman Catholic noble. A general rising followed, and in 1629 it was besieged and taken by Louis XIII. It was reduced to ruins, and the inhabitants, who had not fled, were put to the sword. In 1632 some of the townspeople having fought against Lestrage, who had joined Montmorency’s rebellion, the inhabitants were allowed to return. Some ancient houses, which escaped the general destruction, are still standing.

PRIVATEER, an armed vessel belonging to a private owner, commissioned by a belligerent state to carry on operations of war. The commission is known as letters of marque. Acceptance of such a commission by a British subject is forbidden by the Foreign Enlistment Act 1870. Privateering is now a matter of much less importance than it formerly was, owing to the terms of art. 1 of the Declaration of Paris, April 16, 1856, “Privateering is and remains abolished.” The declaration binds only the powers who are signatories or who afterwards assented, and those only when engaged in war with one another. The United States and Spain have not acceded to it, but though it did not hold as between them in the war of 1868, they both observed it. Privateers stand in a position between that of a public ship of war and a merchant vessel, and the raising of masts is the one thing which should not be gainsaid. The vessel is given rise to so much difficulty in distinguishing between volunteer war-ships and privateers that the subject was made one of those for settlement by the Second Hague Conference (1907). The rules adopted are as follows:—

1. A merchant-ship converted into a war-ship cannot have the rights and duties appertaining to vessels having that status unless it is placed under the direct authority, immediate control and responsibility of the power the flag of which it flies.

2. Merchant-ships converted into war-ships must bear the external marks which distinguish the war-ships of their nationality.

3. The commander must be in the service of the state and duly commissioned by the proper authorities. His name must figure on the list of the officers of the fighting fleet.

4. The crew must be subject to military discipline.

5. Every merchant-ship converted into a war-ship is bound to observe in its operations the laws and customs of war.

A belligerent who converts a merchant-ship into a war-ship must, in the status of war-ships has its recent wars given rise to so much difficulty in distinguishing between volunteer war-ships and privateers that the subject was made one of those for settlement by the Second Hague Conference (1907). The rules adopted are as follows:—

1. A merchant-ship converted into a war-ship cannot have the rights and duties appertaining to vessels having that status unless it is placed under the direct authority, immediate control and responsibility of the power the flag of which it flies.

2. Merchant-ships converted into war-ships must bear the external marks which distinguish the war-ships of their nationality.

3. The commander must be in the service of the state and duly commissioned by the proper authorities. His name must figure on the list of the officers of the fighting fleet.

4. The crew must be subject to military discipline.

5. Every merchant-ship converted into a war-ship is bound to observe in its operations the laws and customs of war.

A belligerent who converts a merchant-ship into a war-ship must, in the status of war-ships has its recent wars given rise to so much difficulty in distinguishing between volunteer war-ships and privateers that the subject was made one of those for settlement by the Second Hague Conference (1907). The rules adopted are as follows:—

1. A merchant-ship converted into a war-ship cannot have the rights and duties appertaining to vessels having that status unless it is placed under the direct authority, immediate control and responsibility of the power the flag of which it flies.

5. Every merchant-ship converted into a war-ship is bound to observe in its operations the laws and customs of war.

A belligerent who converts a merchant-ship into a war-ship must, in the status of war-ships has its recent wars given rise to so much difficulty in distinguishing between volunteer war-ships and privateers that the subject was made one of those for settlement by the Second Hague Conference (1907). The rules adopted are as follows:—
of temperate and tropical Asia; only the common privet is a native of Europe. They are shrubs or small trees with evergreen or nearly evergreen opposite entire leaves, and dense clusters of small, white, tubular four-petaled flowers, enclosing two stamens and succeeded by small, globular, usually black berries, each with a single pendulous seed. The best-known species is the common European privet, L. vulgare, which makes good hedges; L. ovalifolium (a native of Japan) thrives by the seaside and even in towns; there is a yellow-leaved variety (var. variegatum), the leaves becoming white as they get older. L. lucidum (China) is taller and handsomer. There are numerous varieties of L. vulgare in cultivation; var. bazilifolium has broader and more persistent leaves, and L. sambucifolium has long weeping branches; and var. variegatum has the leaves variegated with bright yellow. L. japonicum, L. Massalongianum (Khassia Hills) and other species are also cultivated. Mock-privet is Phillyrea, a member of the same order and a small genus of ornamental hardy evergreen shrubs, natives of the Mediterranean region and Asia Minor.

PRIVILEGE, in law, an immunity or exemption conferred by special grant in derogation of common right. The term is derived from privilege, a law specially passed in favour of or against a particular person. In Roman law the latter sense was the more common; in modern law the word bears only the former sense. Privilege in English law is either personal or real—that is to say, it is granted to a person, as a peer, or to a place, as the privileges of the Houses of Parliament. The most important modern privileges in England are the privileges of parliament (see Parliament), which protects certain communications from being regarded as libellous (see Libel and Slander), and certain privileges enjoyed by the clergy and others, by which they are to some extent exempt from public duties, such as serving on juries. Privileged copyholds are those held by the custom of the manor and not by the will of the lord. There are certain debts in England, Scotland and the United States which are said to be privileged—that is, such debts as the executor must first apply the personal estate of the deceased, in payment, for example, for funeral expenses or servants’ wages. In English law the term “preferred” rather than “privileged” is generally applied to such debts. There are certain deeds and summonses which are privileged in Scots law, the former because they require less solemnity than ordinary deeds, the latter because the ordinary induciae are shortened in their case (see Watson, Law Dict., s.v. “Privilege”).

In the United States the term privilege is of considerable political importance. By art. iv. § 2 of the constitution, “the citizens of each state shall be entitled to all privileges and immunities of citizens in the several states.” By art. xiv. § 1 of the amendments to the constitution (enacted July 28, 1868), “no state shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States.” It will be noticed that the former applies to citizens of the states, the latter to citizens of the United States. “The intention of the framers was that a state, if one may so say, a general citizenship, and to communicate all the privileges and immunities which the citizens of the same state would have been entitled to under the like circumstances” (Story, Constitution of the United States, § 1806). The clauses have several times been the subject of judicial decision in the Supreme Court. With regard to art. iv., it was held that a state licence tax discriminating against commodities the production of other states was void as abridging the privileges and immunities of the citizens of such other states (Ward v. State of Maryland, 12 Wallace’s Reports, 418). With regard to art. xiv. 1, it was held that its main purpose was to protect from the hostile legislation of the states the privileges and immunities of citizens of the United States, looking more especially to the three vital points, namely, the right to receive the benefit of the laws of the United States in every state, the right of residence in states which have no antecedent allegiance, and the right to the protection of the United States against their own states. Accordingly it was held that a grant of exclusive right or privilege of maintaining slaughter-houses for twenty-one years, imposing at the same time the duty of providing ample con-

vénences, was not unconstitutional, as it was only a police regulation for the health of the people (The Slaughter-House Cases, 16 Wallace, 36). The same has been held of a refusal by a state to grant to a woman a licence to practise law (Bradwell v. The State, 16 Wallace, 130), of a state law confining the rights of suffrage to males (Minor v. Happersett, 21 Wallace, 162), and of a state law regulating the sale of intoxicating liquors (Bartmeyer v. Iowa, 18 Wallace, 120). Suit to redress the deprivation of privilege secured by the constitution of the United States must be brought in a United States court. It is a crime to conspire to prevent the free exercise and enjoyment of any privilege, or to conspire to deprive any person of equal privileges and immunities, or under colour of law to subject any inhabitant of any state or territory to the deprivation of any privileges or immunities (Revized Statutes of United States, §§ 5507, 5510, 5519).

PRIVY COUNCIL. The origin of the privy council dates back substantially to the Norman period of English history. The commune concilium, the assembly, in theory, of all the tenants-in-chief of the Crown, had attached to and included in it a group of officers of state and of the royal household, who with a staff of clerks and secretaries carried on the executive, judicial and financial business of government. This group, of necessity permanent, it is suggested, formed the curia regis; and appears to have consisted of the chancellor, the chief justice (so long as the office lasted), the treasurer, the steward, the chamberlain, the marshal and the constable, together with the chief clerks and secretaries, who were in theory, and in fact, possessed of the power to appoint. Their duties were to advise the king in matters of legislation and administration, to see justice done and generally to execute the royal will. Such a blend of advisory, executive and judicial power could exist only in a simple condition of affairs, and therefore it was to be expected that as government became more settled, and so more complicated, a separation of powers would inevitably follow. The change came quickly. Quite early finance was dealt with by a small section of the court convened at the exchequer chamber; this soon developed into a separate department controlled by the treasurer, managing the revenue and deciding all suits connected with its administration. A little later the court of king’s bench and the court of common pleas grew into being, and by the end of the reign of John the council was separated from one another and from the curia. The establishment of separate courts of justice, although relieving the curia of much of its work, did not deprive it of all judicial power. The king was the fountain of justice, and where redress could not be obtained in the ordinary way, either from the greatness of the disputants, through private oppression, or because no other means existed, resort still remained to the Crown, either in the first instance or when all other courses had failed the petitioner. Relieved of financial detail and the bulk of its judicial work, the curia continued to develop on the lines of an advisory and administrative council. Becoming prominent as a council of regency during the minority of Henry III., it quickly assumed a position of supreme importance. The king’s council being the royal person’s own personal body, the members take an oath; they are sworn of the council—to give good advice, to protect the king’s interests, to do justice honestly, to take no gifts” (Maitland, Const. Hist. p. 91). At this period in addition to the great officers of state the judges and a number of bishops appear among the members. One of the most important duties of the council was to advise the Crown in matters of legislation. During the fourteenth and fifteenth centuries, ordinances in subordinate matters appear to have been made regularly by the king in council and accepted as legal by parliament and by the judges. In early parliamentary days it was also part of the council’s duty to put into legislative form the petitions sent up by the Commons. Frequently the statute in its final form did not correspond with the petition, and the Commons were continually complaining of the council’s unwarrantable interference. Eventually by the reign of Henry VII. the council had ceased to interfere, the petitions being drawn in the form of a bill, and enacted without alteration.
During the 14th century the council regis had become definitely distinct as well from parliament as from the courts of law. Under Henry IV. in 1404 the council numbered nineteen—three bishops, nine peers and seven commons. The members held office at the king’s pleasure; they are sworn to give their best advice and are well paid for their work. They meet continually, though the king is often absent, but their proceedings are committed to writing. Maitland (Const. Hist. p. 199) sums up the work as follows: “The function of the Council is to advise the King upon every exercise of the royal power. Every sort of ordinance, licence, pardon, that the King can issue is brought before the Council. Sometimes Parliament trusts it with extraordinary powers of legislation and taxation; to raise loans and the like. It is to the advice of the Council that the King looks in all his financial difficulties.” The powers of the council naturally varied with the character of the king. Quiescent and obedient under a strong king, its influence was re-asserted under a weak one; and when infant kings sat on the throne, for all practical purposes it became the ruler of the land.

In spite of the existence of regular courts of law the council continually interfered with affairs of justice. Many attempts were made by it to set aside or to disregard the judgments of the ordinary courts, but by the beginning of the 15th century parliament had forcibly intervened, and the council gave in. Repeatedly statutes were passed during the reign of Edward III. with a view to checking the council’s original jurisdiction in criminal matters, but without effect, as in the reigns of Henry IV. and his son the Commons are found still petitioning against the practice. Yet during the period under review parliament is continually enacting that certain offenders are to be punished by and at the discretion of the council. Evidently such a tribunal, quickly and informally constituted, bound by no legal rules and maxims, proved a useful engine for sharp and speedy punishment. In 1487 was passed an act (3 Hen. VII. c. 1) which is accounted the creator of the Court of Star Chamber. Perjury, riot, bribery of jurors and misconduct of officials had grown rife, and the act authorizes certain members of the council to call offenders before it, to examine them, and if satisfied of their guilt, to punish them. In later years a committee of the council appear to have sat and exercised a widely extended criminal jurisdiction, inflicting every kind of punishment short of the death penalty. This body became known as the Court of Star Chamber and remained in existence until its abolition by act of parliament in 1641.

During the 14th century many petitions relating to civil disputes were presented to the council and were frequently taken into consideration by it on the ground that extraordinary remedies were required, either from lack of legal form or owing to influential private oppression. Eventually where the courts could decide, it became the practice of the council not to interfere, but where no relief could be obtained the council passed the petition on to the chancellor. In course of time the petitions went direct to the chancellor, and in this manner the equity jurisdiction of the council of officers was changed into that of the council of ministers. The act of 1641, which abolished the Court of Star Chamber, also formally forbade the council to meddle with civil causes.

During the Tudor period the council grew in importance; it became useful to the Crown as a vehicle for straining prerogative to the utmost. By the act 32 Hen. VIII. the king’s proclamation acquired the force of law, and for a short period the king in council had concurrent legislative power with parliament. Henry’s statute was repealed by 1 Edw. VI. c. 12 and the legislative supremacy of parliament re-established. In 1553 the council numbered forty members—four bishops, fourteen peers and the rest commons. The increase in the number of its members, the direct and often independent communication between the Crown and its secretaries, and the strong personality of the Tudor sovereigns quickly reacted on the work of the council. It had become too large for consultative purposes and the sovereign began a practice, which quickly grew, of consulting only its important members. In this way, within the council itself, there appears a small inner ring—a true privy council—the parent of the cabinet of later days.

The struggle of James I. and Charles I. for absolute power and finally the Rebellion, ended by leaving the council for the time being impotent. The act of 1641 had not only abolished its special criminal jurisdiction but forbade its interference in civil cases, while the growth of the Secretariat had gradually removed the bulk of its administrative powers. In the end there was little left for it but occasional meetings to give legal sanction to orders it had no concern with, and on the judicial side to act as a court of final resort in Admiralty matters and for all civil and criminal appeals from the courts of the Crown’s dominions beyond the seas.

In the reign of Charles II. an attempt was made to revive the usefulness of the council. A scheme was prepared by Sir William Temple in 1679 and accepted by the king. A representative council of thirty members came into being and attempted to carry out the new scheme, but the king, after a short trial, held to his old opinion that the numbers of the council made it “unit for the secrecy and despatch which are necessary in many great affairs.” Once more the king returned to his confidential committee, his cabal, out of which the cabinet of the future grew. Under William III. faction flourished and made general agreement at the council board impossible. “George I., ignorant of the English language, never appeared at its meetings, with the result that the direction of affairs passed into the hands of a committee of ministers—the cabinet.

Although the true privy council is the cabinet, the name is to-day given collectively to a large number of eminent people whose membership and position are titular only. All members of the cabinet if not already privy councillors become so on appointment to cabinet office. Occasionally, subordinate members of the ministry and some of its private supporters are made privy councillors as a special distinction. The lord chancellor, the lords of appeal in ordinary, the president of the probate division, the lord president of the court of session in Scotland, the lord justice clerk and the lord advocate of Scotland are the other privy councillors, as are the archbishops of Canterbury and York and the bishop of London. In 1897 all the premiers of the self-governing colonies were made privy councillors. Of recent years, retired ambassadors, judges, retired civil servants and persons distinguished in science, letters and arts have been appointed. The custom seems also to be growing of using the honour of privy councillor to reward political supporters who do not wish for hereditary titles. The collective title of the council is “the Lords and others of His Majesty’s Most Honourable Privy Council.” The members are addressed as “Right Honourable” and wear a state uniform. The appointment is informal, the new privy councillor simply being invited by the king to take his seat at the board. He is then sworn in, and his name placed on the list. Office lasts for the life of the sovereign and six months after, but it is the modern custom for the new sovereign to renounce the appointment.

Meetings of the whole council are held at the beginning of each reign or whenever the sovereign so announces his or her marriage. The lord mayor of London is then summoned to attend. The whole council might also be summoned on other occasions of state and ceremony.

The formal meetings of the council are attended by the few councillors concerned with the orders to be issued. These are generally ministers or officials. The chief official of the council is the lord president, now a cabinet minister of the highest rank, but without departmental duties. The office of clerk of the council dates from 1540 and his signature is necessary to authenticate all orders.

The administrative work of the council has always been done through committees, and during the last two centuries in spite of changed conditions this rule has been preserved in theory. The board of trade, the local government board, the education department and the board of agriculture were all committees of the council. Now, of course, these so-called committees are state departments presided over by ministers responsible to
PRIVY PURSE—PRIZE

373

The existing jurisdiction of the council is both administrative and judicial.

Administrative.—This jurisdiction depends chiefly upon statutory authority, and makes the privy council a subordinate legislative. It is found impossible for parliament to enact long and intricate measures dealing with departmental detail, hence a general measure is passed and the privy council is authorized under the act to draw up orders in council which of course have the force of law. This power was originally given by the council of the Channel Islands and by the council of the Channel Islands is referred to a committee for the affairs of Jersey and Guernsey. The committee report to the Crown in council, and their report is adopted and enforced by an order in council published in the Gazette. Among other acts conferring administrative powers on the privy council are the Pharmacy Act (1852), as amended by 31 & 32 Vict. c. 121, the Medical Act (1858), the Foreign Enlistment Act (1870), the Destructor Insects Act (1877), the Contagious Diseases Act (1878), the Dentists Act (1878), the Veterinarian Surgeon Act (1881).

Judicial.—By the 3 & 4 Will. IV, c. 41 a judicial committee of the council was constituted. It consists of all the members of the council holding or having held the office of lord president and chamberlain, and of all the members of the council who have been appointed for the consideration of charters of incorporation under the Municipal Corporations Act (1882), the latter a matter of considerable difficulty and delicacy and usually carried out in close consultation with the local authorities. Constitutions of the Channel Islands are referred to a committee for the affairs of Jersey and Guernsey. The committee report to the Crown in council, and their report is adopted and enforced by an order in council published in the Gazette. Among other acts conferring judicial powers on the privy council are the Pharmacy Act (1852), as amended by 31 & 32 Vict. c. 121, the Medical Act (1858), the Foreign Enlistment Act (1870), the Destructor Insects Act (1877), the Contagious Diseases Act (1878), the Dentists Act (1878), the Veterinarian Surgeon Act (1881).

PRIVY PURSE, is the amount set apart in the civil list (q.v.) for the private and personal use of the sovereign in England. During the reign of Queen Victoria it was £50,000 a year, but on the accession of Edward VII the amount was fixed at £75,000 a year, which was the amount paid to the last sovereign (Queen Victoria). It is a sort of controller-general of the sovereign's private purse, who is charged with all payments made by the sovereign for his private expenses or charities and is termed the keeper of the privy purse. The department of the keeper of the privy purse to the sovereign, assumed its existing shape in the earlier part of the last century. Under Queen Victoria the offices of keeper of the privy purse and private secretary were combined. As now organized these branches of the royal household consist of the private secretary and the keeper of the privy purse, two assistant private secretaries and keepers of the privy purse, a secretary, assistant secretary and several clerks of the privy purse. These officials, though of the royal household, are not in the department of the lord steward or the lord chamberlain, but are of the king's personal staff.

PRIVY SEAL, a seal of the United Kingdom, next in importance to the great seal, and occupying an intermediate position between it and the signet. The authority of the privy seal was principally of a two-fold nature. It was a warrant to the lord chancellor to affix the great seal to such patents, charters, &c., as must necessarily pass the great seal (more particularly letters patent, grants of land, &c., which the authority required official form, and was appended to documents of minor importance which did not require the great seal. Previous to the Great Seal Act 1884, all letters patent conferring any dignity, office, monopoly, franchise or other privilege were always passed under the privy seal before passing under the great seal.

LORD PRIVY SEAL is the title of the officer who had the custody of the privy seal. He was originally known as the "keeper of the privy seal." The importance of the office was due to the desire of the privy council and the parliament in the 14th and 15th centuries to place some check on the issue of public money, as well as to prevent the use of the great seal by the sovereign without any intermediary except the lord chancellor. The lord privy seal first appears as a minister of state in the reign of Edward III. Until 1537 he was always an ecclesiastical, but is now more usually a temporal lord. He is the fifth great officer of state, and takes rank next after the president of the council and before all dukes.

See Anson, Law and Custom of the Constitution (1896).

PRIZE, or PRIZE OF WAR (Fr. prise, from prendre, to take), a vessel or cargo captured by a belligerent on the high seas; also the act of capture. Under Blockade, Contraband, and Neutrality will be found details of existing practice as regards infringements of international law which expose neutrality vessels and cargoes to capture and trial in a prize court. Under Prize of War will be found the application of international law in relation to the private property of subjects and citizens of belligerent states as between them. We treat here of the manner of dealing with prizes after they have been brought into the jurisdiction of the prize court.

Under the law in force at the beginning of 1910 the subject was governed by the following English acts: the Naval Prize Act 1864 (27 & 28 Vict. c. 25); the Colonial Courts of Admiralty Act 1890 (53 & 54 Vict. c. 27); the Supreme Court of Judicature Act 1891 (54 & 55 Vict. c. 53, s. 4), and the Prize Courts Act 1894 (57 & 58 Vict. c. 39). A new Naval Prize Act was,
PRIZE

however, already in contemplation, repealing the acts of 1864 and 1894, consolidating and re-enacting their main provisions and making such statutory provisions as will permit of the ratification of a convention adopted at the second Hague Conference (1907) for the establishment of an International Prize Court.

The Convention referred to above contains an elaborate scheme of 50 articles setting out the constitution and procedure of the court. It begins with the following declaration of its objects:

Animated by the desire to settle in an equitable manner the differences which sometimes arise in the course of a naval war in connexion with the decisions of national prize courts:

Considered it to be the duty of the courts to continue to exercise their functions in the manner determined by national legislation, it is desirable that in certain cases an appeal should be provided under conditions conciliating, as far as possible, the public and private interests involved in matters of prize:

Whereas, moreover, the institution of an international court, whose jurisdiction and procedure would be carefully defined, has seemed to be the best method of attaining this object:

Convinced, finally, that in this manner the hardships consequent on naval war would be mitigated: that, in particular, good relations will be more easily maintained between belligerents and neutrals, and peace better assured. . . .

It prescribes that the court shall be composed of fifteen members out of the whole panel (art. 14). Of these Great Britain, France, Germany, Austria-Hungary, Russia, Italy, the United States and Japan each appoint one (art. 15). A schedule of the other powers is appended to the Convention, under which their turn shall be to sit to the number of seven, making up together the prescribed fifteen. As composed under the first year's distribution, the other judges would be appointed by Argentina, Colombia, Spain, Greece, Norway, Holland, and Turkey.

There are also full provisions as to the procedure and conduct of the proceedings in the court, but the only provisions of concern to general readers are those relating to international law, which are as follows:—

1. The validity of the capture of a merchant-ship or its cargo is decided before a prize court in accordance with the present convention when neutrality properly is involved.

2. Jurisdiction in matters of prize is exercised in the first instance by the prize courts of the belligerent captor.

3. The judgments of these courts are pronounced in public or are officially communicated to all concerned who are neutrals or enemies.

4. The judgments of national prize courts may be brought before the international prize court:—

i. When the judgment of the national prize court affects the neutral power of the individual;

ii. When the judgment affects enemy property and relates to:—

(a) Cargo on board a neutral ship;
(b) An enemy ship captured in the territorial waters of a neutral power, when that power has not made the request to secure the subject of a diplomatic claim;
(c) A claim based upon the allegation that the seizure has been effected in violation, either of the provisions of a convention in force between the belligerent powers, or of an enactment issued by the belligerent captor.

5. An appeal may be brought:—

i. By a neutral power, if the judgment of the national tribunals injuriously affects its property or the property of its nationals (art. 3 (i.)), or if the capture of an enemy vessel is alleged to have taken place in the territorial waters of that power (art. 3 (ii.) (b));

ii. By a neutral individual, if the judgment of the National Court injuriously affects his property (art. 3 (i.)), subject, however, to the condition that the neutral power to which he belongs may forbid him to bring the case before the court, or may itself undertake the proceedings in his place;

iii. By an individual subject or citizen of an enemy power, if the judgment of the National Court injuriously affects his property in the cases referred to in art. 3 (ii.), except that mentioned in paragraph (b).

6. An appeal may also be brought on the same conditions as in the preceding article, by persons belonging to neutral states or to the enemy, deriving their rights from and entitled to represent an individual qualified to appeal, and who have taken part in the proceedings before the national court. Persons so entitled may appeal separately to the extent of their interest.

The same rule applies in the case of persons belonging either to neutral states or to the enemy who derive their rights from and are entitled to represent a neutral power whose property was the subject of the decision.

6. When, in accordance with the above art. 3, the international court has jurisdiction, the national courts cannot deal with a case in more than two instances. The municipal law of the belligerent captor shall decide whether the case may be brought before the international court after judgment has been given in first instance only after the case has been decided.

If the national courts fail to give judgment within two years from the date of capture, the case may be carried direct to the international court.

A question of law to be decided is covered by a treaty in force between the belligerent captor and a power which is itself or whose subject or citizen is a party to the proceedings, the court is governed by the provisions of the said treaty.

In the absence of such a treaty, the court shall apply the rules of international law. If no generally recognized rule exists, the court shall give judgment in accordance with the general principles of justice and equity.

The above provisions apply equally to questions relating to the order and mode of proof.

If, in accordance with art. 3 (ii.) (c), the ground of appeal is the violation of an enactment issued by the belligerent captor, the court shall enforce the enactment.

The court may disregard failure to comply with the procedure laid down in the convention of the belligerent captor, when it is of opinion that the consequences of complying therewith are unjust and impracticable.

8. If the court pronounces the capture of the vessel or cargo to be null, they shall be disposed of in accordance with the laws of the belligerent captor.

If it pronounces the capture to be null, the court shall order return of the vessel or cargo, and shall fix, if there is occasion, the amount of the damages. If the vessel or cargo have been sold or destroyed, the court shall determine the compensation to be given to the owner on this account.

If the national prize court has pronounced the capture to be null, the court can only be asked to decide as to the damages.

9. The contracting powers undertake to submit in good faith to the decisions of the international prize court, and to carry them out with all possible speed.

The British delegates, in their report on the work of the Conference, wrote that it was to them a subject of satisfaction that they had been able to accomplish the task thus laid upon them, "not, indeed, in the form of an adaptation of the machinery of the existing court, but in the form of a new institution"; and that the convention drawn appeared to them to be "a very noteworthy step in the history of law as the first attempt to constitute a really international court, and as the first device to produce uniformity in any branch of international law." Here, however, the delegates overstated the scope of the work done, and in order to obtain that uniformity a further conference was held in London (Dec. 1908-Feb. 1909) "arrive at an agreement as to what are the generally recognized rules of international law within the meaning of art. 7 of the Convention. The London Conference drew up a series of rules which it declared "correspond in substance with the generally recognized principles of international law" on Blockade (q.v.), Contraband of War (q.v.), Unneutral service, Destruction of Neutral Prizes, Transfer to a Neutral Flag, Enemy Character, Convoys (q.v.), Resistance to Search and Compensation. These rules, if ratified, will bind the international court.

The proposal to submit captures in war to a special international jurisdiction has often been made, and in fact it suggests itself whenever there are two opinions concerning the justice of a prize court's decision.

The Institute of International Law in 1887, after adopting a very full code of prize law, consisting of no fewer than 122 articles and covering every branch of the subject, forwarded them to the different European governments, with the expression of a wish that "in the future reform might take a still more complete shape by the institution of an international tribunal for trial of prize cases.

The subject was brought up at the session in 1905 at Chris-

This was the position of the discussion at the opening of the
second Hague Conference in June 1907, when the British and German delegates announced that they had been instructed to present schemes for the establishment of an international court of appeal in matters of naval prize. Two projects were simultaneously presented on behalf of Great Britain and Germany.

The original English idea was to "secure the adaptation" of the machinery of the existing Hague Court to the purposes of an "International Tribunal of Appeal" from decisions of belligerent prize courts. The official instructions, published in the correspondence respecting the Second Conference observed, in reference to the proposal, that the "judgments of the tribunal in such cases would probably prove the most rapid and efficient means which can, under existing conditions, be devised for giving form and authority to the canons of international law in matters of prize." The instructions continue that the advantages would far outweigh any difficulty which might arise from the fact that some alterations in the municipal laws of this country, and probably also of other states, would be required, and that "H.M. Government considered that if the Hague Conference accomplished no other object than the constitution of such a tribunal, it would render an inestimable service to civilization and mankind."

The objection to the existing system is that the judge is appointed by the belligerent state whose interest it is to condemn the capture; that his bias, if any, is against the neutral interest. But will there be no room in an international prize court for bias against the belligerent? "Representing as we do," said Mr Choate at the sitting of the 11th of July, "a widely extended maritime nation, and a nation which hopes and confidently expects always in the future to be a neutral nation, we deem the establishment of an international court of prize by this Conference to be a matter of supreme importance." The converse may obviously be as important for a nation which, with its vast dependencies, cannot with equal confidence expect to remain a mere spectator among the rivalries of expanding states in different quarters of the globe. The interests of the civilized world in time of war are divisible into three groups, namely, the respective interests of the two belligerents, and the interest of the neutrals. In practice the interest of the neutrals is against the making of captures. Under the system hitherto prevailing it is the judge appointed by the captor who decides whether the capture was a legitimate one or not. It may be contended, however, that he hears the case and gives his judgment in the face of the whole neutral world, at all times the larger part of civilized mankind, and one which has now infinitely greater facilities for making its voice heard than it had a century earlier, when a powerful belligerent maritime state was, out of all proportion to any neutral combination, able to enforce its views as regards neutral property.

PRIZREN (also written Prizren, Prižren, Prištrani, Priština and Përzeri), the capital of the sanjak of Prizren, in the vilayet of Kossovo, Albania, European Turkey; 65 m. E. by road, and 93 m. N. by rail, due west of the White Drin. Pop. (1905), about 30,000, chiefly Mahomedan Albanians, with a minority of Roman Catholic Albanians, Serbs and Greeks. Prizren is beautifully situated 1424 ft. above sea-level, among the northern outliers of the Shar Planina. To the north-west a fertile and undulating plain, watered by the White Drin, extends as far as Ipek (42 m.). A good road connects Prizren with the Ferisovich station on the Salonica-Mitrovitsa railway (37 m.). The city is the seat of a Roman Catholic archbishop, a Greek bishop, and a Servian theological seminary. Its chief buildings are the cathedral and many mosques, one of which is an ancient Byzantine basilica, originally a

1 Prince von Bülow was credited with suggesting in his correspondence on the question of the Bundesrat that a tribunal of arbitration should be instituted to deal with all questions of capture. At any rate, on the 19th of January 1900 he wrote that the German government had proposed that all the points then in dispute should be submitted to arbitration. The British government declared their concurrence in the institution of a tribunal to arbitrate upon claims for compensation.

PRIZREN—PROA

Servian cathedral. In its bazaars an active trade in agricultural produce, glass, pottery, saddlery, and copper and iron ware is carried on; but the manufacture of fire-arms, for which Prizren was long famous throughout European Turkey, has suffered greatly from foreign competition.

Prizren has sometimes, though on doubtful evidence, been identified with the ancient Tharandus or Tharanista. In the 12th century it was the residence of the kings of Servia, and the sanjak of Prizren forms part of the region still called Old Servia (Stara Srbija) by the Slavs. From the 13th century to the 16th Prizren had a flourishing export trade with Ragusa, and it has always been one of the principal centres of commerce and industry in Albania.

PRIJEVALSKY [PRIJEVALSKY], NIKOLAI MIKHAILOVICH (1839—1888), Russian traveller, born at Kimbory, in the government of Smolensk, on the 1st of March 1839, was descended from a noble Cossack family. He was educated at the Smolensk gymnasium, and in 1855 entered an infantry regiment as a subaltern. In November 1856 he became an officer, and four years later he entered the academy of the general staff. From 1864 to 1866 he taught geography at the military school at Warsaw, and in 1867 he was admitted to the general staff and sent to Irkutsk, where he started to explore the highlands on the banks of the Usuri, the great southern tributary of the Amur. This occupied him until 1869, when he published a book on the Usuri region, partly ethnographical in character. Between November 1870 and September 1873, accompanied by only three men and with ridiculously small pecuniary resources, he crossed the Gobi desert, reached Peking, and, pushing westwards and south-westwards, explored the Ordos and the Ala-shan, as well as the upper part of the Yangtse-kiang. He also penetrated into Tibet, reaching the banks of the Di Chu river. By this remarkable journey he proved that, for resolute and enduring men, travelling in the Central Asian plateaus was easier than had been supposed. The Russian Geographical Society presented him with the great Constantine medal, and from all parts of Europe he received medals and honorary diplomas. The work in which he embodied his researches was immediately translated into all civilized languages, the English version, Mongolia, the Tangut Country, and the Solitudes of Northern Tibet (1876), being edited by Sir Henry Yule. On his second journey in 1877, while endeavouring to reach Lhasa through Turkestan, he re-discovered the great lake Lop-nor (q.v.), which had not been visited by any European since Marco Polo. On his third expedition in 1879—1880 he penetrated, by Hami, the Tsai-dam and the great valley of the Tibetan river Kara-su, to Napchu, 170 m. from Lhasa, when he was turned back by order of the Dalai Lama. In 1883—1885 he undertook a fourth journey of exploration in the wild mountain regions between Mongolia and Tibet. On these four expeditions he made collections of plants and animals of inestimable value, including nearly twenty thousand zoological and sixteen thousand botanical specimens. Among other remarkable discoveries were those of Theranda, Threndus, Prizren, and the salt lake of Issyk-kul. On his return from his fourth journey, he presented the Russian Geographical Society with an account of the mountain regions of the Central Asian plateau, and its treasures of geology, botany, and zoology, with a map, the first ever published, of the great mountain mass of the Tien Shan, in which the mountain of Himalaya is situated.

PRIZREN—PROA (Malay, prov), the general term in the Malay language for all vessels, from the sampau or canoe to the square-rigged kapal, but in western usage confined to the sail-sailing craft that the pirates of the Indian Ocean made familiar to sailors in eastern waters. The chief points which characterize these vessels are that while the weather-side is rounded the lee-side is flat from stem to stern, that both stern and stern are exactly similar in shape, and that there is a small similarly shaped hull swung out from the side of the main hull on poles, which acts
PROBABILISM—PROBABILITY

as an outrigger and prevents the vessel heeling over. The main hull carries the mast rigging and an enormous triangular-shaped sail.

PROBABILISM (from Lat. probare, to test, approve), a term used both in theology and in philosophy with the general implication that in the absence of certainty probability is the best criterion. Thus it is applied in connexion with casuistry for the view that the layman in difficult matters of conscience may safely follow a doctrine inculcated by a recognized doctor of the church. This view was originated by the monk Molina (1528–1581), and has been widely employed by the Jesuits. In philosophy the term is applied to that practical doctrine which gives assistance in ordinary matters to one who is sceptical in respect of the possibility of real knowledge: it supposes that though knowledge is impossible a man may rely on strong beliefs in practical affairs. This view was held by the disciples of the New Academy (see Scepticism and Carneades). Opposed to "probabilism" is "probabiliorism" (Lat. probabilior, more likely), which holds that when there is a preponderance of evidence on one side of a controversy that side is presumably right.

PROBABILITY (Lat. probabilis, probable or credible), a term which in general implies credibility short of certainty.

The mathematical theory of probabilities deals with certain phenomena which are employed to measure credibility. This measurement is well exemplified by games of chance. If a pack of cards is shuffled and a card dealt, the probability that the card will belong to a particular suit is measured by—we may say, is—the ratio 1:4, or 1:4; there being four suits to any one of them the card might have belonged. So the probability that an ace will be drawn is 4:52, as out of the 52 cards in the pack 4 are aces. So the probability that an ace will turn up when a die is thrown is 1:6. The probability that one or other of the two events, ace or deuce, will occur is 1:3. If simultaneously a die is thrown and a card is dealt from a pack which has been shuffled, the probability that the double event will consist of two aces is 1:6×52, as the total number of double events formed by combining a face of a die with a face of a card is 6×52, and out of these 1:4 consist of two aces.

The data of probabilities are often prima facie at least of a type different from that which has been described. For example, the probability that a child about to be born will be a boy is about 0.51. This statement is founded solely on the observed fact that about 51% of the children (alive, dead, in hospital, in countries) prove to be boys. The probability is not, in the instance of dice and cards, measured by the proportion between a number of cases favourable to the event and a total number of possible cases. Those instances indeed also admit of the measurement based on observed frequency. Thus the number of times that a die turns up ace is found by observation to be about 16.6% of the number of throws; and similar statements are true of cards and coins.1 The probabilities with which the calculus deals admit generally of being measured by the number of times that the event is found by experience to occur, in proportion to the number of times that it might possibly occur.

The idea of a probable or expected number is not confined to the number of times that an event occurs; if the occurrence of the event is associated with a certain amount of money or any other measurable article there will be a probable or expected amount of that article. For instance, if a person throwing dice is to receive two shillings every time that six turns up, he may expect in a hundred throws to win about 2×16.6 (about 32.3) shillings. If he is to receive two shillings for every six and one shilling for every ace, his expectation will be 2×16.6+1×16.6 (50) shillings. The expectation of lifetime is calculated on this principle. Of 1000 males aged ten say the probable number who will die in their next year is 490, in the following year 397, and so on; if we (roughly) estimate that those who die in the first year will have enjoyed one year of life after ten, those who die in the next year will have enjoyed two years of life, and so on;

then the total number of years which the 1000 males aged ten may be expected to live is

\[ 1 \times 1000 + 2 \times (1000-490) + 3 \times (1000-490-397) + \ldots \]

Space as well as time may be the subject of expectation. If drops of rain fall in the long run with equal frequency on one point—or rather on one small interval, say of a centimetre or two—on a band of finite length and negligible breadth, the distance which is to be expected between a point of impact in the upper half of the line and a point of impact in the lower half has a definite proportion to the length of the given line.2

Expectation in the general sense may be considered as a kind of average.4 The doctrine of averages and of the deviations therefrom technically called "errors" is distinguished from the other portion of the calculus by the peculiar difficulty of its method. The paths struck out by Laplace and Gauss have hardly yet been completed and made quite secure. The doctrine is also distinguished by the importance of its applications. The theory of errors enables the physicist so to combine discrepant observations as to obtain the best measurement. It may abridge the labour of the statistician by the use of samples.5 It may assist the statistician in testing the validity of inferences.6 It promises to be of special service to him in perfecting the logical method of concomitant variations; especially in investigating the laws of heredity. For instance the correlation between the height of parents and that of children is such that if we take a number of men all of the same height and observe the average height of their adult sons, the deviation of the latter average from the general average of adult males bears a definite proportion—a half—to the similarly measured deviation of the height common to the fathers. The same kind and amount of correlation between parents and children with respect to many other attributes besides stature has been ascertained by Professor Karl Pearson and his collaborators.7 The kinetics of free molecules (gases) forms another important branch of science which involves the theory of errors.

The description of the subject which has been given will explain the division which it is proposed to adopt. In Part I probability and expectation will be considered apart from the peculiar difficulties incident to errors or deviation from averages. The first section of the first part will be devoted to a preliminary inquiry into the evidence of the primary data and axioms of the science. Freed from philosophical difficulties the mathematical calculation of probabilities will proceed in the second section. The analogous calculation of expectation will follow in the third section. The contents of the first three sections will be illustrated in the fourth by a class of examples dealing with space measurements—the so-called "local" or "geometrical" probabilities. Part II, devoted to averages and the deviations therefrom, or more generally that grouping of statistics which may be called a law of frequency. Part II is divided into two sections distinguished by differences in character and extent between the principal generalizations respecting laws of frequency.

PART I.—PROBABILITY AND EXPECTATION

Section I.—First Principles.

1. As in other mathematical sciences, there are probabilities, or even more so, the philosophical foundations are less clear than the calculations based thereon. On this obscure and controversial topic absolute uniformity is not to be expected. But it is hoped that the following summary in which diverse authoritative judgments are balanced may minimize dissent.

2. (1) How the Measure of Probability is Ascertained.—The first question which arises under this head is: on what evidence are the facts obtained which are employed to measure probability? A very generally accepted view is that which Laplace has thus expressed:

\[ \text{It is more usual to speak of the mean expectation, the average number of years to end per head.} \]

\[ \text{Below, par. 88.} \]

\[ \text{For more exact definition see below, par. 95.} \]

\[ \text{See Bowley's Address to Section F. of the British Association (1906).} \]

\[ \text{See Biometrika, vol. iii. "Inheritance of Mental Characters."} \]

---

1. Cf. note to par. 5 below.
“The probability of an event is the ratio of the number of cases which favour it to the number of all the possible cases, when nothing leads us to believe that one of these cases ought to occur rather than the others; which renders them, for us, equally possible.” Against this view, certain critics have held that mere psychological laws can at best afford a measure of belief, not of credibility. According to the ground of probability is sought in the observed fact of a class or series such that if we take a great many members of the class, or terms of the series, the proportion of any one term out of the total number taken is likely to be a certain fraction as a limit. Thus the series which consists of heads and tails obtained by tossing up a well-made coin is such that out of a large number of throws the proportion of heads to tails is nearly always 1 to 1. There are no species of events so diametrically opposed as may at first appear. On the other hand, those who follow Laplace would of course admit that the presumption afforded by the number of favourable cases with respect to the probability of the hypothesis in question is increased with a view to be modified in accordance with actual experience such as that below cited respecting particular dice that they turn up five six rather oftener than once in three times. On the other hand, the series which is regarded as the empirical basis of the various probabilities and which is the subject of uniformity which ordinarily characterizes scientific laws; which would not be satisfied for instance by the proportionate frequency of any one digit, e.g., 6, in the expansion of 1/99, is likely to be a constant. This is thus formed which seems to rest on as extensive if not so definite an empirical basis as the series which we began by considering. Thus the so-called intellectual probability 13 which it has been shown to be founded upon fractions of the relative frequency of occurrence, may still rest on a similar though less obvious ground of experience. This type of probability not verified by specific experience is presented in two particularly important classes.

6. Unverified Probabilities.—In applying the theory of errors to the art of measurement it is usual to assume that prior to observation one value of the quantity under measurement is as likely as another. This is called the probability of a point. Laplace 14 in this respect supposed that this may exactly suppose it to have any value between zero and unit. The assumption is fundamentally similar whether the quantity is a ratio to be determined by the theorem of Bayes, 15 or an absolute quantity determined by the number of favorable cases to the number of all possible cases. For this first principle it is well observed by Professor Karl Pearson 16 that “there is an element of human experience at the bottom of Laplace’s assumption. Professor Pearson quotes with approbation 16 the following sentence from the “Mathematical Theory of Knowledge” in which the author says Laplace, ‘we may equally suppose it to have any value between zero and unit.’” One may further be repeated that this proposition is true of the times it cannot be true of the lengths. One may refer to the objection of the former one. For we are concerned only with a small tract of values it will often happen that this proposition is true of the times it cannot be true of the lengths. This proposition is true of the times it cannot be true of the lengths.

7. It may be objected, no doubt, that one value (of the object under measurement) is often known beforehand not to be as likely as another. The barometric height for instance is not equally likely to be 29 in. or 29.1 in. The reply is that the postulate is only required with respect to a small tract of values that considered by the probability of a point. This point is a particular value of the probability of a point.

8. It is further objected that the assumption in question involves inferences in cases like the following. Suppose observations are made on the length of a pendulum together with the time of its oscillation. As the time is proportional to the square root of the length, it follows that if the values of the length occur with equal frequency in a series of such observations, the times also occur with equal frequency. If this is assumed, the proposition is true of the occasions. One may refer to the objection of the former one. For we are concerned only with a small tract of values it will often happen that this proposition is true of the occasions. This proposition is true of the occasions.

1 Laplace, Théorie analytique des probabilités, liv. II, ch. i, No. 1, Introd. 16 pr. 1. 2 The term employed by Venn in his important Logic of Chance. 3 Below, par. 119. 4 E. g. 87, 157. The expansion of which the digit 8 occurs once in ten is quite a seemingly random fashion (see Mess. of Maths. 1864, vol. 2, pp. 1 and 39).

The probability is the ratio of the number of cases which both events are of the number of all the possible cases, when nothing leads us to believe that one of these cases ought to occur rather than the others; which renders them, for us, equally possible. Against this view, certain critics have held that mere psychological laws can at best afford a measure of belief, not of credibility. According to the ground of probability is sought in the observed fact of a class or series such that if we take a great many members of the class, or terms of the series, the proportion of any one term out of the total number taken is likely to be a certain fraction as a limit. Thus the series which consists of heads and tails obtained by tossing up a well-made coin is such that out of a large number of throws the proportion of heads to tails is nearly always 1 to 1. There are no species of events so diametrically opposed as may at first appear. On the other hand, those who follow Laplace would of course admit that the presumption afforded by the number of favourable cases with respect to the probability of the hypothesis in question is increased with a view to be modified in accordance with actual experience such as that below cited respecting particular dice that they turn up five six rather oftener than once in three times. On the other hand, the series which is regarded as the empirical basis of the various probabilities and which is the subject of uniformity which ordinarily characterizes scientific laws; which would not be satisfied for instance by the proportionate frequency of any one digit, e.g., 6, in the expansion of 1/99, is likely to be a constant. This is thus formed which seems to rest on as extensive if not so definite an empirical basis as the series which we began by considering. Thus the so-called intellectual probability which it has been shown to be founded upon fractions of the relative frequency of occurrence, may still rest on a similar though less obvious ground of experience. This type of probability not verified by specific experience is presented in two particularly important classes.

6. Unverified Probabilities.—In applying the theory of errors to the art of measurement it is usual to assume that prior to observation one value of the quantity under measurement is as likely as another. This is called the probability of a point. Laplace in this respect supposed that this may exactly suppose it to have any value between zero and unit. The assumption is fundamentally similar whether the quantity is a ratio to be determined by the theorem of Bayes, or an absolute quantity determined by the number of favorable cases to the number of all possible cases. For this first principle it is well observed by Professor Karl Pearson that “there is an element of human experience at the bottom of Laplace’s assumption. Professor Pearson quotes with approbation the following sentence from the “Mathematical Theory of Knowledge” in which the author says Laplace, ‘we may equally suppose it to have any value between zero and unit.’” One may further be repeated that this proposition is true of the times it cannot be true of the lengths. One may refer to the objection of the former one. For we are concerned only with a small tract of values it will often happen that this proposition is true of the occasions. This proposition is true of the occasions.

7. It may be objected, no doubt, that one value (of the object under measurement) is often known beforehand not to be as likely as another. The barometric height for instance is not equally likely to be 29 in. or 29.1 in. The reply is that the postulate is only required with respect to a small tract of values that considered by the probability of a point. This point is a particular value of the probability of a point.
PROBABILITY

11. Interdependence Probabilities.—According to the principles of probabilities it is usual to enumerate, after Laplace, several other propositions. But these may here be rapidly passed over as they do not seem to involve any additional philosophical difficulty.

12. We will first consider that whenever independent of each other the product of their separate probabilities forms the probability of their concurrence (l'existence de leur ensemble) is the product of their separate probabilities.\(^4\)

13. Probability of Causes and Future Effects.—The first principles which we have now presented are the foundation on which the reasoning is described as deducing the probability of a cause from an observed effect. If with the poet\(^5\) we may represent a perfect mixture by the waters of the Po in which the two Doras and other tributaries are indiscriminately commingling, no great difference in respect of definition and deduction between the probability that a certain particle of water should have emanated from a particular source, or should be discharged through a particular noet, is observable. We may say, instead of the retrospective or inverse probability is not essentially different from the one first stated (Principle I.).\(^10\)

14. Nor is a new first principle necessarily involved when after ascending from an effect to a cause we descend to a collateral effect.\(^11\) It is true that in the case of a simple cause and effect the reverse, or descending, is not necessarily to the unverified species of probability. An instance has already been given of several approximately equiprobable causes, the several values of a quantity under measurement, from one of which the conclusion that some chance or other has occurred, must have, so to speak, emanated. A simpler instance of two alternative causes occurs in the investigation which J. S. Mill\(^12\) has illustrated—whether an event, such as a succession of aces, has been produced by a particular cause, such as riding a die, or by an accidentally produced chance. It is sufficient for the argument that the "a priori" probabilities of the alternatives should not be very unequal.

15. Whether Credibility is Measurable. —The domain of probabilities according to some authorities does not extend much, if at all, beyond the objective phenomena which have been described in the preceding paragraphs. The claims of the science to measure the subjective, or mental, aggregation of the mass of evidence. Belief, it is objected, depends upon a complex of perceptions and emotions not amenable\(^14\) to calculus. Moreover, belief is not credibility; even if we do believe with more or less confidence in exact conformity with the measure of probability afforded by the calculus we ought so to believe? In reply it must be admitted that many of the beliefs on which we have to act are not of the kind for which the calculus prescribes. It was absurd of Craig\(^13\) to attempt to evaluate, in terms of probability, the question whether a nation would or would not continue to exist. But there seem to be a number of simpler cases of which we may say with De Morgan\(^17\) "that in the universal opinion of those who examine the subject, the state of mind to which a person ought to be raised by the observation of an immense number of accidents, is the same as upon the non-arrival\(^18\) of the event." Two or three roughly distinguished degrees of credibility—very probable, as probable as not, very improbable, practically impossible—suffice for the more general purposes of the science. In this respect the calculus is merely a step in an analysis of the subject, and its use is to reduce all matters of credibility to quantities not admitting of a precise unit, such as colour

\(^{27}\) It is well remarked by Professor Irving Fisher (Capital and Income, 1907, ch. xvi.), that Bernoulli's theorem involves a "subjective" element a "psychological magnitude." The remark is applicable to the general theory of error of which the theorem of Bernoulli is a particular case (see below, paras. 103, 104).

\(^{28}\) In the hands of Professor Karl Pearson, Mr. Sheppard and Mr Yule. Cf. par. 149, below.
of eye or curliness of hair. A closer analogy is supplied by the older writers who boldly handle "moral" or subjective advantage, as will be shown under the next head.

15. (3) Axioms of Expectation.—Expectation so far as it involves probability is substantially statistical or statistical expectation. The occurrence in connexion with two principles analogous to and deducible from propositions which have been stated with respect to probability.

(i) The expectation of the sum of two quantities subject to risk is the sum of the expectations of each. (ii) The expectation of the product of two quantities subject to risk is the product of the expectations of each, provided that the risks are independent. For example, let one of the fortuitously fluctuating quantities be the winnings of a player at one game in which he takes the amount $A$ if he throws ace with a die (and nothing if he throws another face). Then the expectation of that quantity is $kA$; or, in $n$ trials ($n$ being large), the player may expect to win about $nA$. Let the other fortuitous fluctuating quantity be the winnings of a player at another game in which he takes the amount $B$ when an ace of any suit is dealt from an ordinary pack of cards. The expectation of this quantity is $kB$; or in $n$ trials the player may expect to win about $nB$. Now suppose a compound trial at which one simultaneously throws a die and deals a card; and let his winning at a compound trial be the sum of the amounts which he would have received for the die and the card respectively at a simple trial. In $n$ such compound trials he may expect to win about $n(A+kB)$. The expectation of the winning at a compound trial is the sum of the separate expectations.

Next suppose the winning at a compound trial to be the product of the two amounts which he would have received for the die and the card respectively at a simple trial. A simple trial has been comprised of two compound trials. It is $AB$ when this double event occurs. But this double event occurs in the long run only once in $78$ times. Accordingly the expectation of the winning at a compound trial at which the product of the probability of each is $nAB$ is $nA$ and $nB$ is the product of the separate expectations. What has been shown for two expectations of the simplest type, where $a$ is the probability of an event which has been associated with a quantity $a$, may easily be extended to several expectations each of the type

$$a_1a_1a_2a_2a_3a_3a_4a_4a_5a_5 \ldots$$

where $a_
u$ is an expectation of the simplest type, above exemplified, or of one of several types of these above.

For by the law which has been exemplified the sum of $r$ expectations can always be reduced to the sum of $r-1$, and then the $r-1$ to $r-2$, and so on; and the like is true of products.

16. Independence of Events.—It should also be observed as to the independence of the probabilities involved is required only by the second of the two fundamental propositions. It may be dispensed with by the first. Thus in the example of interdependent probabilities given by Laplace alleged urns about which it is known that two contain only black balls and one only white—if a person drawing a ball first from C and then from B is to receive $x$ shillings every time he draws a white ball, from one or other of the urns, he may if he expects to perform the combinatorial operations in the manner described he be assured of an exact and decided proportion in the microcosm. But the expectation of the product of the number of shillings won by drawing a white ball from C and the number of shillings won by afterwards drawing a white ball from B is not $n(\nu/13)$, but $n^2(\nu/13)^2$.

17. Expectation of Utility.—A philosophical difficulty peculiar to expectation arises when the quantity expected has not the objective character usually presupposed in the applications of mathematics. The most signal occurrence is when the expectation relates to an advantage that is estimated subjectively by the amount of utility or satisfaction afforded to the possessor. Mathematicians have commonly adopted the assumption made by Daniel Bernoulli that a small increase in a person's material or "physical fortune" may increase satisfaction or "moral fortune," inversely proportional to the physical fortune; and accordingly that the moral fortune is equateable to the logarithm of the physical fortune. The spirit in which this assumption should be employed is well expressed by Laplace when he says that the expectation of subjective advantage (l'espérance morale) "depends on a thousand variable circumstances which it is almost always impossible to define and still more to submit to calculation." 19 One cannot give a general rule for appreciating this relative value, yet the peculiar case of lotteries, to which the common cases leads to results which are often useful. 20

19. In this spirit we may regard the logarithm in Bernoulli's (as in Matthe's) theory as representative of a more general relation of the subjective or value of a stimulus, which has been accepted by economists and utilitarian philosophers whose judgment on the relation between material goods and utility or satisfaction carries weight. Thus Professor Alfred Marshall writes: 21 In accordance with a supposition made by Daniel Bernoulli, it may perhaps be supposed that the satisfaction which a person derives from his income may be regarded as beginning when he has enough to support life and afterwards as increasing by equal amounts with every equal successive increase of income, until he is unable to tell the difference between the two incomes. 22 The general principle is embedded in Bentham's utilitarian reasoning which has been widely accepted. 23 The possibility of formulating the relation between feeling and its external cause is further supported by Fechner's investigations. This branch of Probabilities also obtains support from another part of the science, the calculation sanctioned by Laplace, of the disutility incident to error of measurement. 24 Altogether it seems impossible to deny that some simple mathematical operations prescribed by the calculus of probabilities are sometimes serviceably employed to estimate prospective benefit in the subjective sense of desirable feeling.

20. Single Cases and "Series."—Analogous to the question regarding the standard of action arises under the head of expectation. The former question, it may be observed, arises chiefly with respect to events which are considered as singular, not forming part of a series of similar events. The third question is one that is involved in tossing (unloaded) dice the event which consists of obtaining either a five or a six will occur in approximately $33.3\%$ of the trials. The important question is what is or should be our state of mind when we are told the result of a single trial, the dice having not been repeated, like the choice of a casket in the Merchant of Venice. 25 A similar difficulty is presented by singular events, with respect to valuation. Is the chance of one to a thousand of the prize $\£\,1000$ at a lottery approximated to $\£\,1$ as one might suppose for once, and once only, has the offer of such a stake? The question is separable from one with which it is often confounded, the one discussed in the last paragraph what is the "moral" value of the prize to the person in whom the interest resides, the case of both belong to the category of small change. The stake and the prize might both be "moral." The better opinion seems to depart from a system of transactions like that in which an insurance company undertakes, or at least a "cross-series" 26 of the kind which seem largely to operate in ordinary life, expectations in which the risks are very different are not as a rule comparable. So De Morgan with regard to the "single case" (the solitary transaction in question) denies the existence of the moral probability being mostly of the qualified 27 species.

18. Expectation of Utility.—A philosophical difficulty peculiar to expectation arises when the quantity expected has not the objective character usually presupposed in the applications of mathematics. The most signal occurrence is when the expectation relates to an advantage that is estimated subjectively by the amount of utility or satisfaction afforded to the possessor. Mathematicians have commonly adopted the assumption made by Daniel Bernoulli that a small increase in a person's material or "physical fortune" may increase satisfaction or "moral fortune," inversely proportional to the physical fortune; and accordingly that the moral fortune is equateable to the logarithm of the physical fortune. The spirit in which this assumption should be employed is well expressed by Laplace when he says that the expectation of subjective advantage (l'espérance morale) "depends on a thousand variable circumstances which it is almost always impossible to define and still more to submit to calculation." 19 One cannot give a general rule for appreciating this relative value, yet the peculiar case of lotteries, to which the common cases leads to results which are often useful. 20

21. Object of the Section.—In the following calculations the principal object is to ascertain the number of cases favourable to an event in proportion to the total number of possible cases. 21

23. Cf. below, par. 72.

24. "Sayings on Probability," p. 209, note, "with reference to the cases and (2) frequency of observed occurrence; the former especially pertain to the data and quosita of this section.

Section II.—Calculation of Probability.

25. Below, par. 152.

26. Consider the equivalent of Laplace's second principle given at par 9, above, and his third principle quoted at par. 10.

27. In the more familiar form: that of the two independently fluctuating quantities the mean of the product is the product of the means (cf. Ceuber, Theorie der Beobachtungsfehler, p. 133.)

29. The utilities afford some justification for Laplace's restriction of the term expectation to "goods." As to the wider definition adopted here see below, par. 94 and par. 95, note.

30. Each fortune referred to is divided by a proper parameter. See below, par. 106.
"The difficulty consists in the enumeration of the cases," as Lagrange says. Sometimes summation is the only mathematical operation employed; but very commonly it is necessary to apply the theory of permutations and combinations involving multiplication.\(^1\)

22. Fundamental Theorem.—One of the simplest problems of this sort is one of the most important. Given a médange of things consisting of two species, if \(n\) things are taken at random what is the probability that \(s\) out of these \(n\) things will be of a certain species? For example, the médange might be a well-shuffled pack of cards, and we ask what is the probability that if \(n\) cards are dealt that if \(s\) cards are dealt, \(s\) of them will be black? There are two varieties of the problem: either after each card is dealt it is returned to the pack, which is reshuffled, or all the \(n\) cards are dealt (as in ordinary play) without replacement. The first variety of the problem deserves its place as being not only the simpler, but also the more important, of the two.

23. At the first deal there are 26 cases favourable to black, 26 to red, so the chance of getting a black card is \(26/52\). But if one card is dealt and a black card is taken, in the second round the number of cases favorable is 25, for there are only 25 black cards left, and the chances of getting a black card are now \(25/51\). Thus, for \(n\) successive trials the probability of obtaining \(s\) black and \(n-s\) red cards is

\[
\frac{(26/52)(25/51)(24/50)...(26-s/52-s)}{(26/52)(25/51)...(26/21)}
\]

The calculation may be simplified by writing this expression in the form

\[
\frac{26!}{s!(26-s)!}\left(\frac{26}{52}\right)^s\left(\frac{26}{52}\right)^{26-s}
\]

The successive terms of the expansion give the respective probabilities that there will be in the successive trials the numbers of black cards specified, and all the possible numbers among which \(s\) is presumably included (otherwise the answer is zero). Of course we are not limited to six alternatives; instead of a die we may have a teetotum with any number of sides.

24. The probability may also be calculated as follows. Taking for instance the case of dealing either of two suits, consider any particular arrangement of the \(n\) cards, of which \(s\) are hearts, e.g. the arrangement in which the \(s\) cards first dealt are hearts and the following \(n-s\) all belong to other suits. The probability of that first \(s\) cards being all hearts is \((s/52)^s\) and the probability that none of the last \((n-s)\) cards are hearts is \((39/52)^{n-s}\). Hence the probability of that particular arrangement occurring is \((s/52)^s(39/52)^{n-s}\). But this arrangement is but one of many, e.g. that in which the \(s\) hearts occur at the second deal, and therefore there are other arrangements which are not distinguishable in the fractions which the terms at either extremity diminishes. In the greatest terms which are in the neighbourhood of the greatest term of the expansion, the sum total of the remaining terms, which in the example above given, if we go on and deal to the 50th card (with replacement) the ratio of the red cards dealt to all the cards dealt tends to become more and more nearly approximate to the limit \(39/52\).

The formula may be regarded as tautological or circular. Yet the proofs of the theorem which have been given, which are at once so much less involved than any that may be given on the principle of the fractions, as at least showing the consistency of first principles. Moreover, as was stated, James Bernoulli's imports something more than the first axiom of probabilities.\(^6\)

26. The generalization of the Binomial Theorem which is called the "Multinomial Theorem" is the rule which gives the probability that if \(s_1, s_2, \ldots, s_r\) and \(n-s_1-s_2-\ldots-s_r\) cards are dealt, there will be \(s_1\) hearts, \(s_2\) diamonds and \(s_3\) clubs.

\[
\frac{n!}{s_1!(s_2!)\ldots(s_r!)}\left(\frac{13}{52}\right)^{s_1}\left(\frac{13}{52}\right)^{s_2}\ldots\left(\frac{13}{52}\right)^{s_r}\left(\frac{39}{52}\right)^{n-s_1-s_2-\ldots-s_r}
\]

Now consider any other arrangement of the \(r\) cards, e.g. of the \(s_1\) hearts to occur first and the remaining \(s_2-s_1\) last. The denominator in the above expression for the probability that \(s_1\) hearts, \(s_2\) diamonds and \(s_3\) clubs will occur is the same as for the (the) above problem; and in the numerator the number of different arrangements, which, as in the simpler case of the problem, is the same as the number of combinations formed by \(s_1\) things taken together \(s_1\) times, that is: \(s_1!(s_1-s_2-\ldots-s_r)!\). A formula thus obtained may be generalized by substituting \(n\) for \(s\) or \(n-s\).

\(^2\) Cf. Todhunter, History..., of Probability, p. 360, and other statements of James Bernoulli's Theorem, referred to in the index.

\(^3\) Venn, op. cit. p. 91.

\(^4\) When the degree in which a certain range of central terms tends to preponderate over the residue of the series is formulated with precision when he is interpreting Laplace, then James Bernoulli's theorem presents a particular case of the law of error—the case considered below in par. 103.

\(^5\) The law of error given below, par. 104.

\(^6\) See Chrystal, Algebra, ch. xxiii. § 12; or other textbook of algebra.
METHODS OF CALCULATION

PROBABILITY

381

52, 51 for 13, 50 for 39 (where \( p + q = 1 \); \( p \) and \( q \) are integers). A formula thus generalized is proposed by Professor Karl Pearson as proper to represent the frequency with which different values are assumed by a quantity depending on causes which are not independent.

29. Miscellaneous Examples: Games of Chance.—The majority of the problems under this heading cannot, like the preceding two, be regarded as conducing directly to statistical methods which are required in investigating some parts of nature. They are at least elegant exercises in a kind of mathematical reasoning which is required in most of such methods. Games of chance present some of the best examples. We may begin with one of the oldest, the problem which the Chevalier de Méré put to Pascal when he questioned:—How many times must a pair of dice be thrown in order that it may be an even chance that double six—the event called sonnez—may occur at least once? 

The answer may be obtained by finding a general expression for the probability that the event will occur at least once in \( n \) trials; and then determining \( n \) so that this expression = \( \frac{1}{2} \). The probability of the event occurring is the difference between unity and the probability of its failing. Now the probability of "sonnez" failing at a single throw (of two dice) is \( \frac{35}{36} \). Therefore the probability of its failing in \( n \) throws is \( \left( \frac{35}{36} \right)^n \). Whence we obtain, to determine \( n \), the equation \( 1 - \left( \frac{35}{36} \right)^n = \frac{1}{2} \), which gives \( n = 24.605 \) nearly.

30. In the preceding problem the quasium (unity minus) subtracted all of the possible events an assigned one ('sonnez') should fail to occur in the course of \( n \) trials. In the following problem the quasium is the probability that out of all the possible events one or other should fail—that they not all be represented in the course of \( n \) trials. A die being thrown \( n \) times, what is the probability that all three of the following events will fail (that one or other of the three will not occur at least once); viz. (a) either ace or deuce turning up, (b) either 3 or 4, (c) either 5 or 6. The number of cases in which one at least of these events fails to occur is equal to the number of cases in which (a) fails, plus the number in which (b) fails, plus the number in which (c) fails, minus the number of cases in which two of the events fail concurrently (cases without this subtraction would be counted twice). Now the number of cases in which (a) fails to occur in the course of the \( n \) trials is \( \left( \frac{25}{36} \right)^n \) all of the possible cases numbering \( 3^n \).

Like propositions are true of (b) and (c). The number of cases in which both (a) and (b) fail is \( \left( \frac{22}{36} \right)^n \) of the total; and the like is true of the cases in which both (a) and (c) fail and the cases in which both (b) and (c) fail. Accordingly the probability that one at least of the events will fail to occur in the course of \( n \) trials is

\[
3 \left( \frac{25}{36} \right)^n - 3 \left( \frac{22}{36} \right)^n.
\]

31. One more step is required by the following problem: If \( n \) cards are dealt from a pack, each card after it has been dealt being returned to the pack, which is then reshuffled, what is the probability that one or other of the four suits will not be represented? The probability that hearts will fail to occur in the course of the \( n \) deals is \( \left( \frac{39}{40} \right)^n \); and the like is true of the three other suits. From the sum of these probabilities it is to be subtracted the sum of the probabilities that there will be concurrent failures of any two suits; from this subtrahend are to be subtracted the proportional number of cases in which there are concurrent failures of any three suits (otherwise cases such as that in which e.g. hearts, diamonds and clubs concurrently failed\footnote{See Whitworth, Exercises in Choice and Chance, No. 502 (p. 125); referring to prop. xiv. of the same author's Choice and Chance.} would not be represented at all). Now the probability of any assigned two suits failing is \( \left( \frac{37}{40} \right)^n \); the probability of any assigned three suits failing is \( \left( \frac{35}{40} \right)^n \). Accordingly the required probability is

\[
4 \left( \frac{39}{40} \right)^n - 6 \left( \frac{37}{40} \right)^n + 4 \left( \frac{35}{40} \right)^n.
\]

The analogy of the Binomial Theorem supplies the clue to the solution of the general problem of which the following is an example.

\begin{footnotesize}
\footnote{Trans. Roy. Soc. (1895). See below, par. 165.}
\footnote{Todhunter, History of Probability, and Bertrand, Calcul des probabilités, p. 9.}
\footnote{All three events cannot fail.}
\footnote{(c) occurring \( n \) times.}
\footnote{The reasoning may be illustrated by using the area of a circle to represent the frequency with which hearts fail, another (equal) circle for diamonds; for the case in which both hearts and diamonds fail the area common to the circles interlapping, and so on.}
\footnote{See Whitworth, Choice and Chance, question 143, p. 183, ed. 4.}
\footnote{Ibid.}
\footnote{There is such a table at the end of De Morgan's article in the Calculus of Probabilities in the Ency. Brit. "Pure Sciences," vol. ii.}
\footnote{Cancelling factors common to the numerator and denominator.}
\end{footnotesize}
at an examination and $r$ optional subjects from which each candidate chooses one ($r > s$), what is the probability that no two candidates should choose the same subject? If the candidates be arranged in any order, the probability that the second candidate should not choose the same subject as the first is $(r-1)/r$. The probability that the third candidate will not choose either of the two subjects taken by the aforesaid candidates is $(n-2)/n$, and so on. Thus the required probability is

$$P(n) = \frac{(n-1)(n-2)\cdots(n-r+1)}{n^r}.$$  

38. When as it is the nature of the problem lies chiefly, in the application of the theory of combinations, or permutations, there is a propriety in Whitworth's enunciation of the questions under the head of choice rather than chance. It comes to the same whether we say that there are $x$ ways in which an event may happen, or that the probability of it happening is $1/x$. For example, suppose that there are $n$ couples walking at a ball; if the names of the men are arranged in alphabetical order, what is the probability that the names of their partners will also be in alphabetical order? The probability that the man who is first in alphabetical order should have for partner the lady who is first in that order is $1/n$. The probability that the man who is second alphabetical order should have for partner the lady who is second in that order is $1/n$, and so on. Therefore the required probability is $1/n!$. Or it may be easier to say that the number of ways, each consisting of a set of couples in which the party can be arranged, is $n!$; of which only one is favourable.

39. The same principle governs the following question. For how many days can a family of 10 continue to sit down to dinner in a different order each day? It not being indifferent who sits at the head of the table—what is the absolute, as well as the relative, position of each member—there are 10! possible arrangements. The answer is that if we are to attend to the relative position only— as would be natural if the question related to 10 children turning round a fairy— the number of different arrangements would be only 9! students. The answer is $9!$. This may serve to introduce a method which Laplace has applied with great éclat in probabilities. Let $y_n$ be the number of ways in which $n$ men can take their places at a round table, without respect to their absolute position: and consider how the number of ways will be increased by introducing an additional man. From every particular arrangement of the original $n$ men can now be obtained $n$ different arrangements of the $n+1$ men (since the additional man may be introduced in any of the $n$ places of the original array). Hence $y_{n+1} = ny_n$, an equation of differences of which the solution is $y_n = n!(1+1/2+1/3+\cdots+1/n)$. The constant may be determined by considering the case in which $n = 2$.

41. The following example is not quite so simple. If a coin is thrown $n$ times, what is the chance that head occurs at least twice running? Calling each sequence of two throws a "case," consider the number of cases in which head never occurs twice running let $u_n$ be this number, then $2^n - u_n$ must be the number of cases when head occurs at least twice running. Consider the value of $u_n$. Since each of the $n + 1$ preceding throws which gave no succession of heads; and if the last be head must one be, and these two be preceded by any one of the $u_n$ favourable cases for the first $n$ throws. Consequently

$$u_{n+1} = u_n + u_n.$$  

If $a$, $b$ are the roots of the quadratic $x^2 - x = 0$, this equation gives

$$u_n = Aa^n + Bb^n.$$  

Here $A$ and $B$ are easily found from the conditions $u_0 = 2$, $u_1 = 3$; viz.

$$A = \frac{a^n}{a - b}, \quad B = \frac{b^n}{a - b},$$

whence

$$u_n = \frac{n - 1}{n - 1 + 1} \left(1 + \frac{1}{2} + \frac{1}{3} + \cdots + \frac{1}{n} \right).$$

The probability that head never turns up twice running is found by dividing this by $2^n$; the probability, of course, becomes smaller and smaller as the number of trials which is increased. This is a particular case of a more general problem solved by Laplace as to the occurrence $i$ times running of an event of which the probability at one trial is $p$.

42. In such problems where we now employ the calculus of finite differences Laplace employed his method of generating functions. A distinguished instance is afforded by the problem of points which was attacked by the Chevalier de Méré to Pascal and has exercised generations of mathematicians. It consists in this that two players of equal skill have staked equal sums; the stakes to belong to the player who shall have won a certain number of games. Suppose they agree to leave off playing when one player, $A$, wants $i$ points and the second, $B$, wants $j$ points (where $i > j$). In order to complete the assignment number, while the second player wants $x'$ points: how ought they
divide the stakes? This is a question in Expectation, but its difficulty consists in determining the probability that one of the players, say $A$, shall win the stakes. Let that probability be $y_{x'}$. Then, after the next game, if $A$ has won, the probability of his winning the rest of the game is $y_{x'-1}$; but if $B$ loses, winning the probability will be $y_{x'+1}$. But these alternatives are equally likely. Accordingly the probability of $A$ winning the stakes may be written $\frac{1}{2}y_{x'-1} + \frac{1}{2}y_{x'+1}$. This is the same problem as that which was before written $y_{x'}$. Equating the two expressions we have, for the function $y$, an equation of finite difference involving two variables, of which the solution is

$$y = \frac{1}{2}y_{x'-1} + \frac{1}{2}y_{x'+1}.$$  

43. The problem of points is to be distinguished from another class of problems, viz., the problem of the kind in which in order to win simply to win a certain number of games, but to win a certain number of counters from his opponent. Space does not admit even the enunciation of other complicated problems to which Laplace has applied the method of generating functions.

44. Probability of Causes Duced from Observed Events.—Problems relating to the probability of alternative causes, deduced from observed effects, are usually placed in the separate category of "Inverse." An urn, though, as above remarked, they do not necessarily involve different principles. The difference principally consists in the need of evidence, other than that which is afforded by the observed event, as to the probability of the alternative causes existing and operating. The following is an example free from the complications of the prevailing necessity of the hypothesis which commonly besets this kind of problem. A digit having been taken at random from mathematical tables (or the expansion of an constant such as $\pi$); a second digit is obtained by taking from a random succession of digits added to the first digit makes a sum greater than 9. Given a result thus formed, what are the respective probabilities that the second digit should have been $0$, $1$, $2$, $3$ or $8$? In the long run the first digit assumes with equal frequency the values $0$, $1$, $2$, $3$, $4$, $5$, $6$, $7$, $8$, $9$. Accordingly the second digit can never be $0$. There is only one chance of its being 1, namely when the first digit is 9. If the second digit is 2, and the first either 8 or 9, the observed effect will be produced. And so on. If the second digit is 3, and the first is 7, 8, or 9, the effect will be produced. This shows that the long run of pairs thus formed it will occur that the cases or causes which are defined by the circumstances that the second digit is 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, respectively, will occur with frequencies in the following ratios: 1:9:8:7:6:5:4:3:2. The probability of the observed event having been caused by a particular (second) digit, e.g., 7, is $7/(0+1+2+3+4+5+6) = 7/45$. The probability taken from Laplace is of a more formal type. An urn is known to contain three balls made up of white and black balls in some unknown proportion. From this urn a ball is extracted $m$ times (being each time replaced after extraction). If a white ball is drawn every time, what are the respective probabilities of the cases that the urn contains 3, 2, 1 or 0 white balls? By parity of reasoning it appears that in the first case, the probability is certain, its probability in the second case the probability of the observed event occurring is ($\pi^m$), in the third case that probability is ($\pi^m$), in the fourth the probability is 0. Accordingly the respective inverse probabilities are in the ratios

$$1 : \pi^m : 1 - \pi^m : 0.$$

provided (as in the preceding example, with respect to the second digits) the alternative causes, the four possible constitutions of the urn, are (a priori) equally probable. This is a rather bold assumption with respect to the contents of concrete urns and similar groupings; but with regard to things in general may perhaps be justified on the principle of cross-series.

46. Often in the investigation of causes we are not thrown back on the calculus of finite differences, but find a priori probabilities of the cases. We have some evidence of the kind, though of a very rough character. An example has been cited from Mill in a preceding paragraph. Against the improbabilities calculated by the methods of the present section there has often to be set evidence of the kind just referred to. The probability does not admit of mathematical calculation. Bertrand puts the following case. The manager of a gambling house has purchased a roulette table which is said to give red $3500$ times, black $4700$ times, out of $8200$ trials. The public take this as an inducement from the maker. What can the calculi tell us as to the justice of the claim? Nothing

---

4. *A clear and correct version of Laplace's reasoning is given by Todhunter, *History, ... of Probability*, art. 973, p. 528, with reference to the opinion of an entire class in which they are of the opinion that their chances of winning a single game—are not equal but respectively, p and q (q + p = 1). See also Czuber, *Wahrscheinlichkeits-Theorie*, pp. 30 seq.
5. A correct and clear version of Laplace's reasoning is given by Todhunter, *History, ... of Probability*, art. 973, p. 528, with reference to the opinion of an entire class in which they are of the opinion that their chances of winning a single game—are not equal but respectively, p and q (q + p = 1). See also Czuber, *Wahrscheinlichkeits-Theorie*, pp. 30 seq.
precise, yet something worth knowing. The a priori improbability of the maker's inaccuracy must be very great to overcome the improbability of such an event occurring by chance if the machine is accurately made (accuracy being defined, say, by the condition that more than 99.9999990999999999% of the trials would prove successful in the infinitely long run of trials between 0-999 and 0-501). The odds against the so defined event occurring are found to be some millions to one.3

The difficulty recurs in more practical problems: for instance, certain symptoms having been observed, to find the probability that they are produced by a particular disease. Such concrete applications of probabilities are often open to the sort of objections which have been made against the probability of statements in the tribunal of witness. Thus if two witnesses concur in making a statement which must be either true or false, their agreement is a circumstance which is only to be accounted for by one of two alternatives: either that they are both speaking the truth, or both false. If the average truthfulness—the credibility—of one witness is p, that of the other p', then the probabilities of the two alternative explanations are to each other as { (1-p)(1-p') : (1-p') }. But if each of two witnesses, who have not been compared, are found to be telling the truth, the probability of their statements being both true is p²/(p² + (1-p)(1-p')). So far no account is taken of the a priori probability of the statement. This evidence may be treated as an independent witness. Thus, if a person whose credibility is p makes a statement about the health of his horse, and consisting entirely of trumps dealt from a well-shuffled pack of cards, there are two alternative explanations of his assertion, with probabilities in the ratio

\[ \frac{p^2}{p^2 + (1-p)(1-p')} \]

The truthfulness of the witness must be very great to outweigh the a priori improbability of the fact.4 These formulae are easily extended to the case of three or more witnesses. The probability of a statement by three witnesses of respective credibilities p, p', p'' is

\[ \frac{p^2 p''^2}{p^2 p''^2 + (1-p)(1-p')(1-p'')} \]

For r witnesses we have

\[ p_1 \cdots p_r \cdots p_r + (1-p)(1-p') \cdots (1-p''') \]

Dividing both the numerator and the denominator by \( p_1 \cdots p_r \cdots p_r \), we see that the probability of the statement increases with the number of the witnesses, provided that for every witness (1-p)/p is a probability. According to Mill's definition, if the number of witnesses is a large and consisting of utterly independent individuals, we may let our knowledge of any one witness be represented by a trinomial coefficient as

\[ \binom{n}{k} \]

where \( n \) is the number of witnesses and \( k \) is the number of successes. Thus, the probability of two witnesses telling the truth is

\[ \binom{n}{2} \]

Let the whole in question be represented by a line AB=a, and let it be divided at random into n parts by taking n-1 points indiscriminately on it. Let the required mean values be \( \lambda_1, \lambda_2, \lambda_3, \ldots, \lambda_n \). Let us assume that each position is taken in AB for each of the n points, we may take a as representing that number; and the whole n number of cases be

\[ N = a^n \]

The sum of the least parts, in every case, will be

\[ S_1 = \lambda_1 a \]

Let a small increment, \( Bb = \Delta a \), be added on to the line AB at the end B; the increase in this sum is \( \Delta S = \lambda_1 a^2 \). But, in dividing the new line AB into two parts, or \( n-1 \) points fall on AB as before, or \( n-2 \) fall on AB and 1 on Bb (the cases where 2 or more fall on Bb are so few we may neglect them). If all fall on AB, the least part is always the same; but if one point be between when it is the last, at the end of B of the line, and then it is greater than before by \( \Delta a \); as it falls last in \( n \) of the whole number of trials, the increase in \( S_2 \) is \( n^2 a^2 \). But if one point of division falls on Bb, the number of positions introduced in the least part being now an infinitesimal, the sum \( S_3 \) is not affected; we have therefore

\[ \Delta S = \lambda_1 a^2 + \lambda_2 a^3 \]

To find \( \lambda_3 \), reasoning exactly in the same way, we find that when one point falls on Bb and \( n-2 \) on AB, as the least part is infinitesimal, the second least part is the least of the \( n-1 \) parts made by the \( n-2 \) points; consequently, if we put \( \lambda_1 \) for the value of \( \lambda_1 \) when there are \( n-1 \) parts only, instead of \( n \),

\[ S_2 = \lambda_1 a^2 + \lambda_2 a^3 + (n-1) a^3 \lambda_3 \]

In the same way we can show generally that

\[ \lambda_3 = \frac{\lambda_2 a}{n-1} \]

and thus the required mean value of the rth part is

\[ \lambda_r = \frac{\lambda_1 a}{n-1} + \frac{\lambda_2 a}{n-2} + \ldots + \frac{\lambda_{r-1} a}{n-r+2} \]

or more generally, \( \lambda_r = \frac{\lambda_1 a}{n-r+1} + \frac{\lambda_2 a}{n-r+2} + \ldots + \frac{\lambda_{r-1} a}{n-1} \). Thus, it follows that when we have a number of witnesses, the probability of their statements being conformable to truth will increase indefinitely as the number of voters is increased.

Thus, we see the effects based on the average truthfulness or justice of each witness and judge involves the neglect of particulars which ought to influence our estimate of probability, such as the consistency of a witness's statements and the relation of the case to the interests, prejudices and capacities of the witness or the judge.5 Thus even in so simple a case as the alleged occurrence of

3 By a calculation based on the fundamental theorem (above, par. 3).
4 See below p. 51.
5 Morgan Crofton, loc. cit. p. 778, par. 1.
6 Essai, p. 6 (there is postulated a proviso analogous to that which has been stated in par. 49 above, with reference to witnesses: that the probability of any of the answers being right is > 1).
7 See Mill's forcible remarks on this use of probabilities, which
Thus each judge implicitly assigns the probabilities

\[
\frac{1}{n^2} \left[ \frac{1}{n + 1} - \frac{1}{n - 1} \right] \frac{1}{n + 1 - 1} \frac{1}{n - 1 - 1},
\]

to the causes as they stand on his list, beginning from the lowest.

The values assigned for the probability of each alternative cause may be treated as so many equally authoritative representations of the way in which the generalization in question is to be found. According to a general rule given below \(^1\) the observations are to be added and divided by their number; but here if we are concerned only with the relative magnitudes of the probabilities in favour of each alternative, it suffices to compare the values of the two brotherhoods thus arrive at Laplace's rule. Add the numbers found on the different lists for the cause A, for the cause B, and so on; that cause which has the greatest sum is the most probable.

35. The Different Problems Due to Causes.—Another class of problems which it is usual to place in a separate category are those which require that, having ascended from an observed event to probable causes, we should descend to the probability of collateral effects. But no new principle is involved in such problems. The reason may be illustrated by the following modification of the problem about digits which was above set \(^2\) to illustrate the method of deducing the probability of alternative causes.

What is the probability that if to the second digit, which contributed to the effect there described there is added a third digit taken at random, the sum of the second and third will be greater than 9 (or any other assigned figure)? The probabilities—the a posteriori probabilities derived from the event (that the sum of the first two digits exceeds 9) and the a priori probabilities of the alternatives constituted by the different values 0, 1, 2, 3, ..., 8, 9 of the second figure are written in the first of the subjoined rows.

Below each of these probabilities is written the probability, \(\times 10^4\) that if the corresponding cause existed the effect under consideration would result. The product of the two probabilities pertaining to each alternative way of producing the event gives the probability of the event occurring in that way. The products which are written in the third row divided by 45\times 10, viz. \(\frac{45}{10} = 4.5\), is the required probability. It may be expected that actual trial would verify this result.

54. The Theory of Expectation.—One case of inferred future effects, sometimes called the "rule of succession," claims special notice, as having been thought to furnish a test for the cogency of induction. A white ball has been extracted (with replacement after extraction) \(n\) times from an immense number of black and white balls mixed in some unknown proportion; what is the probability that at the \((n+1)\)-th trial a white ball will be drawn? It is assumed that each of the \(\text{mélange}^6\) formed by the proportion of white balls (the probability of drawing a white ball), say \(p\), is a priori as likely to occur as any other, and of the series

\[
\Delta p, 2 \Delta p, 3 \Delta p, \ldots, \frac{1}{2} \Delta p, 1 - \Delta p, 1.
\]

Whence a posteriori the probability of any particular value of \(p\) as the cause of the observed recurrence is \(p^n \Delta p^n\), where \(p\) in the denominator receives every value from \(\Delta p\) to 1. The probability that the first \(k\) trials succeeding the first (after failing at the first) etc, the probability that \(f(1-f)\), the probability of succeeding at the second trial (after failing at the first) is \(f(1-f)\); the probability of succeeding at the third trial is \(f(1-f)\); and so on. Substituting these values for the expression for the expectation, we have the proposition which was to be proved. In the proposed problem

\[
f_0 = 6 \left(\frac{\frac{3}{5} - 15 \cdot \frac{3}{5}}{20} \right)^n + 15 \frac{\frac{3}{5} + 6 \left(\frac{3}{5}\right)}{20},
\]

Assigning to \(n\) in each of these terms, every value from 1 to 20, we get the sum for the sum of the first set, with corresponding expressions for the results formed from the following terms. Whence \(s = 1 + 30 + 30 - 20 = 14\); by parity of reasoning it is proved that on an average \(714\) cards are dealt before any cards are lost.

57. Dominos are taken at random (with replacement after each extraction) from the set of the kind described in a preceding paragraph. What is the difference of the two numbers on each domino? The digit 9, according as it is combined with itself, or any smaller digit, gives the sum of differences

\[
0 + 1 + 2 + \ldots + 9.
\]

The digit 8 combined with itself or any smaller digit gives the sum of the differences \(0 + 1 + 2 + \ldots + 8 = 36\). The sum of the differences is \(2s + r + 1\), where \(r\) has every integer value from 1 to 9 inclusive, \(\frac{9}{2} + 1\left(\frac{9}{2} - 1\right)\), and the difference of the differences is \(10 + 9 + 8 + \ldots + 2 + 1 = 55\). Therefore the required expectation is \(1655/33\).

58. Digits taken at Random.—The last question is to be distinguished from the following. What is the difference (irrespective of sign) between two digits, taken at random from mathematical tables, or the expansion of an endless constant like \(\pi\)? The combinations of different digits will now occur twice as often as the expectation of the sum of the differences that may now be obtained from the consideration that the sum of the positive differences must be equal to the sum of the negative differences when the null differences are distributed equally between the positive and the negative. The sum of the positive set is, as before,

\[

METHODS OF CALCULATION

PROBABILITY

385

64. Expectation of Advantage.—The general examples of expectation which have been given may be supplemented by some appropriate to that special use of the term which Laplace has sanctioned when he considers the subject of expectation as a "good"; 

a. Now let us consider the following "moral" advantage, in more modern phraseology or satisfaction.

65. Pecuniary Advantage.—The most important calculations of pecuniary advantage relate to annuities and insurance; based on life tables from which the probability of life itself, as well as of money value at the end, or at any period, of life is predicted.

The reader is referred to these heads for practical exemplifications of the calculus. It must suffice here to point out how the calculations are facilitated by the adoption of a law of frequencies between the Gompertz or the Gompertz-Makeham law, which on the one hand can hardly be ranked with hypotheses resting on a vera causa, yet on the other hand is not purely empirical, but is recommended, as generally fitting the subject-matter.

66. There is space here only for one or two simple examples of money as the subject of expectation. Two persons A and B throw dice alternately. A, beginning, has the understanding that if one of them first throws an ace he receives a prize of £1. What are their respective expectations?

The chance that the prize should be won at the first throw is \( \frac{1}{6} \), the chance that it should be won at the second throw is \( \left( \frac{5}{6} \right) \frac{1}{6} \); and so on. What is the expectation of A's prize?

Thus A's expectation is to B's as 1 : 5. But their expectations must together amount to £1. Therefore A's expectation is \( \frac{5}{6} \) of a pound, B's \( \frac{1}{6} \).

67. There are tickets numbered 1, 2, 3, etc., in a bag. A man draws two tickets at once, and is awarded a number of sovereigns equal to the product of the numbers drawn. What is his expectation? It is the number of pounds divided by the improper fraction of which the denominator is the number of possible products, \( \binom{n}{2} \), and the numerator is the sum of all possible products; \( \binom{n}{2} + 2 \). Whence the required number (of pounds) is found to be \( \frac{1}{n} (n+1) (3n+2) \). The result may be contrasted with what it would be if the tickets were drawn one at a time, but the second after replacement of the first. On this supposition the expectation in respect of one of the tickets separately is \( \frac{1}{n+1} \). Therefore, as the two events are now independent, the expectation of the product of the expectations of the two is \( \frac{1}{(n+1)} \cdot \frac{1}{n} \).

68. Peter throws three coins, Paul two. The one who obtains the greater number of heads wins £1. If the number of heads are equal, they play again, and so on, until one or other obtains a greater number of heads. What are their respective expectations?

At the first trial there are three alternatives: (a) Peter obtains more heads than Paul, (b) an equal number, (c) fewer. The cases in favour of \( a \) are (1) Peter obtains three heads, (2) Peter two heads, Paul one, Peter one head, Paul none. The cases in favour of \( b \) are (1) two heads for both, or (2) one head, or (3) none, for both. The remaining case favours \( c \): the probability of \( a \) is \( \frac{1}{8} + \frac{3}{8} + \frac{3}{8} = \frac{7}{8} \). The probability of \( b \) is \( \frac{1}{8} + \frac{3}{8} + \frac{3}{8} = \frac{5}{8} \). Peter's expectation is \( \frac{7}{8} \cdot \frac{1}{8} + \frac{5}{8} \cdot \frac{1}{8} \). Paul's expectation is therefore \( \frac{5}{8} \cdot \frac{1}{8} \). An urn contains \( m \) balls marked 1, 2, 3, \ldots, \( m \). Paul extracts successively the \( m \) balls, under an agreement to give Peter a shilling every time that a ball comes out in its proper order. What is Peter's expectation? The expectation with respect to any one ball is \( \frac{1}{m} \), and therefore the expectation with respect to all is \( \frac{1}{m} \).

6. Expectation subjectively estimated.—Elaborate calculations are paradoxically employed by Laplace and other mathematicians to determine the expectation of subjective advantage in various cases of risk. The calculation is based on Daniel Bernoulli's formula which may be written thus: If \( x \) denote a man's physical fortune, and \( y \) the corresponding moral fortune

\[ y = \log (x/k) \]

where \( k \) is the constant. Calculation of expectations of this character is the reverse of the somewhat more plausible approach to the subject outlined by K. Pearson in his theory on the inadequacy of the law of large numbers in relation to the efficiency of wages (Journal of the Royal Statistical Society, Dec. 1907; and Journal of the Royal Economic Society, Dec. 1907).
man must possess some fortune, or its equivalent, in order to live. To estimate now the value of a moral expectation. Suppose a person whose fortune is $a$ to have the chance of obtaining a sum $q$, of obtaining $b$, of obtaining $c$, &c., and let

$$\frac{p_1}{n_1} + \frac{p_2}{n_2} + \ldots + \frac{p_n}{n_n} = 1.$$ 

only one of the events being possible. Now his moral expectation from the first chance—let it be the increment of his moral fortune multiplied by the chance—is

$$p_1 \log \frac{q + a}{a} - p_2 \log \frac{q + b}{b} = \ldots = p_n \log \frac{q + c}{c}.$$ 

Hence his whole moral expectation is

$$E = kp \log \frac{q + a}{a} + kq \log \frac{q + b}{b} + k \log \frac{q + c}{c} + \ldots = -k \log a;$$

and, if $Y$ stands for his moral fortune including this expectation, that is, $p_1 \log (a + q) + \ldots + p_n \log (c + q)$, then

$$Y = k \log (a + q) + \ldots + k \log (c + q) + \ldots - k \log h.$$ 

To find $F$, the physical fortune corresponding to this moral one, we have

$$Y = k \log (a + h) + \ldots + k \log (c + h).$$

Hence

$$F = (a + h) \log (a + h) + \ldots + (c + h) \log (c + h) - \ldots - k \log h.$$ 

And $a - c$ will be the actual or physical increase of fortune which is of the same value to him as his expectation, and which he may reasonably accept in lieu of it. The mathematical value of the same expectation is

$$p_1 q + p_2 q + \ldots + p_n q + \ldots.$$ 

70. Gambling and Insurance.—These formulae are employed, often with the aid of refined mathematical theorems, to demonstrate propositions of great practical importance; that in general gambling is disadvantageous, insurance beneficial, and that in specific cases, in order to better subdivide risks—indeed, to "have all your eggs in one basket.

71. These propositions may be deduced by the use of a formula which perhaps keeps closer to the facts: viz. that utility or satisfaction is the product of the material goods not definitely ascertained, defined only by the conditions that the function continually increases with the increase of the variable, but at a continually decreasing rate (and some additional postulate as to the lower limits, viz. $x < a$, $q < s$, $y < b$). In the physical fortune, and $y$ the corresponding utility or satisfaction; where all that is known in general is that $y'$ is positive, $y''$ is negative; and $y(x)$ is never less, $x$ is always greater than zero. Suppose we have with this physical function a formula for $y(x)$, and the chance of $p$ of obtaining a sum $a$ and the chance $q$ of losing the sum $b$. If the game is to be so made that the value of the $p$ is to be at once, the paradox being that the base of the $p$ and the chance of $q = 1 - p$ of losing the sum $b$. Accordingly the respective psychological advantage of the party is $p_y(a) + p_b(a) + p_y(a) + q(a - b)/q(a + b)$, say $y$. When $y$ is zero, the expression reduces to $y = a$. Hence $y$ is a function of the first differential coefficient of $y = y(a)$, viz. $p_y(a)$, and has $a$. An analogous second differential coefficient, viz. $p_y^2(a) = p_y^2(a + b) = p_q^2(a + b)$, is negative, since by hypothesis $y''$ is continually negative. And as $a$ continues to increase from zero, the second differential coefficient of $y(a - b)$, viz. $p_y(a) + p_q^2(a + b)$, continues to be negative. Therefore the increments received by the first differential coefficient of $y(a) - y$ are continually negative; and therefore $y(a - b)$ is continually negative. When $y$ is $b$, for finite values of $a$ (not exceeding $b$).

72. To show the advantage of insurance, let us suppose with Morgan Croton that a merchant, whose fortune is represented by $a$, will realize a sum of $c$ if a certain vessel arrives safely. The probability of this be $p$. To make up exactly for the risk run by the insurance company, he should pay them a sum $(1 - p)c$. If he does his moral fortune becomes, according to the physical fortune, the secured sum $a + c(1 - p)$; while he does not insurance it will be $p(1 + a + c(1 - p))$. We have then to compare $p(1 + a + c(1 - p))$, say $y_1$, with $p(1 + a + c(1 - p))$, say $y$. By reasoning analogous to that of the preceding paragraph it appears that the increment of moral fortune, as $c$ increases up to any assigned finite (admissible) value. Similarly it may be shown that it is better to expose one's fortune in a number of separate sums to risks independent of each other than to expose the whole to the same danger. Suppose a merchant, having a fortune, has besides a sum $e$ which he must receive if a ship arrives safely. Then, if the chance of the ship arriving is $p$, and $q = 1 - p$, his prospective advantage is $p(1 + e + q(1 - p))$. Now, we are not to regard the sum $c$ as a single risk, let him divide $c$ into $n$ equal parts, each exposed to an independent equal risk $q$ of being lost. As $n$ is made larger it becomes more and more nearly a certainty that he will realize $e$ out of the total $c$ exposed to risk. This is his condition (in respect of the sort of advantage which is under consideration) will be approximately $y_1$.

Thus we have to compare $y_1$, say $y_1$, with $p(1 + e + q(1 - p))$, say $y$. By reasoning analogous to that which has been above employed—observing that $(1 - p)q(1 - p)$ is multiplied by all possible values of $n$, we conclude that $y_1 < y$.

73. The Petersburg Problem.—The doctrine of "moral fortune" was first formulated by Daniel Bernoulli with reference to their celebrated "Petersburg Problem," which is thus stated by Todhunter: "Suppose a man to throw a pair of dice, and to win by each throw a sum of $a + c$; he will receive a shilling from B, if he does not appear until the second throw is to receive $2s$, if he does not appear until the third throw is to receive $4s$, and so on, required the amount of $a + b$.

Theorem.-Let us suppose that there has been room for disputing what is the lesson. Laplace and other high authorities follow Daniel Bernoulli. Poisson finds the explanation in the fact that B could not be expected to pay up in the sum of $a + b$ by a man who regards the disadvantage of gambling as consisting mainly in the danger of becoming "cleaned out," this moral in the Petersburg problem. All have not noticed what some regard as the principal lesson to be obtained from this paradox: that the advantage resulting from a large number of trials at once, as one of a series—what is known as the "cross-series."—is not subject to the general rule for expectations of advantage whatever material or moral.

Section IV. Geometrical Applications.

74. Under this head occur some interesting illustrations of principles employed in the preceding sections; in particular of a priori probabilities and of the relation between probability and expectation.

75. Illustrations of a priori Probabilities.—The assumption has been made under preceding heads that the probability of certain alternatives is approximately equal to the weight of evidence of much the same character as the assumption which is made under this head that one point in a line, plane, or volume is as likely to occur as another, under certain circumstances. Thus consider the proposition: if a given area $S$ is included within a given area $A$, the chance of a point $P$, taken at random on $A$, falling on $S$ is $S/A$. In a great variety of circumstances such a size can be assigned to the spaces, and "taking at random" can be so defined that the proposition is more or less directly based on experience. The fact that the points of incidence are equally distributed in space is deduced, of course, in the same way; e.g., raindrops and molecules. There is a solid substratum of evidence for the premise employed in the solution of problems like the following: On a chess-board, on which the side of every square is $a$, there is, of course, a "coin of diameter $<a/2$ so as to be transmitted the board, which may be supposed to have no border. What is the probability that the coin is entirely on one square? The area on which the coin can fall is $(a - b)^2$. The portion of the area which is favourable to the event is $64(a - b)^2$. Therefore the required probability is $(a - b)^2/(a - b)^2$.

76. Random Lines.—Speculative difficulties recur when we have to define a straight line taken at random in a plane: for instance, in the following problem proposed by Bullough: A floor is ruled with equidistant parallel lines; a rod, shorter than the distance between each pair, being thrown at random on the floor, to find the chance of its falling on one of the lines. The problem is usually solved as follows: Let $a$ be the distance of the rod from the nearest line, $\theta$ the inclination of the rod to a perpendicular to the parallels, $2a$ the common distance of the parallels, $2c$ the length of rod; then, as all values of $a$ and $\theta$ between their extreme limits are equally probable, the whole number of cases will be represented by

$$\int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} f_{\theta} dx = \pi a.$$
Now if the rod crosses one of the lines we must have \( c > \frac{x}{\cos \theta} \) \( \mid \) so that the favourable cases will be measured by
\[
\int_{-\pi/2}^{\pi/2} \frac{dx}{\cos \theta} = 2c.
\]
Thus the probability required is \( p = 2c\pi \). It may be asked—why should we take the centre of the rod as the point where distance from the nearest line has all its values equally probable? Why not one extremity of the line, or some other point? The question is thus formulated. Fortunately it makes no difference in the result to what point in the rod we assign this pre-eminence.

77. The legitimacy of the assumption obtains some verification from the calculation suggested by Laplace: if a rod is actually thrown, as supposed in the problem, a great number of times, and the frequency with which it falls on one of the parallels is observed, that proportionate number thus found, say \( p \), furnishes a value for the constant \( \pi \). For \( \pi \) ought to equal \( 2\pi p \). The experiment has been made by Professor Wolf of Frankfort. Having thrown a needle of length 36 mm. on a plane ruled with parallel lines at a distance from each other of 45 mm. 5000 times, he observed that the needle crossed a parallel 2532 times. Whence the value of \( \pi \) is derived: \( \pi = 3.506 \), with a probable error \( \pm 0.05 \).

78. More hesitation may be felt when we have to define a random chord of a circle, \(^2\) for instance, with reference to the question, what is the probability that a chord taken at random will be greater (2) perpendicular to the bilaterally symmetrical line? But the construction of \( \pi \) in volume it would no doubt be proper to assume that the chord is constructed by taking any point on the circumference and joining it to another point on the circumference, the points from which one of these points is considered an intersection of the two chords would be parallel to the circumference. On this understanding the probability in question would be \( \frac{1}{2} \). But in other connexions, for instance, if the chord is obtained by the intersection with the circle of a rod thrown in random fashion, it seems preferable to consider the chord as a straight line falling at random on a plane. Morgan Crofton \(^3\) himself gives the following definition of such a line: If an infinite number of straight lines be drawn at random in a plane, there will be as many parallel to any given direction as to any other, all directions being equally probable; also those having any given direction will be disposed with equal frequency all over the plane. Hence, if a line be determined by the co-ordinates \( p, \omega \), the perpendicular on it from a fixed origin \( O \), and the inclination of that perpendicular to a fixed axis, then, if \( p \omega \) be made to vary by equal infinitesimal increments, the series of lines so given will represent the entire series of random straight lines. Thus the number of lines for which \( p \) falls between \( p \) and \( p + dp \), and \( \omega \) between \( \omega \) and \( \omega + d\omega \), will be measured by \( dpd\omega \), and the integral \( \int dpd\omega \), between any limits, measures the number of lines within those limits.

79. Authoritative and useful as this definition is, it is not entirely satisfactory. It amounts to this, that if we write the equation of the random line
\[
x \cos a + y \sin a - p = 0,
\]
we ought to take \( a \) and \( p \) as those variables, of which the equiprobable values are equally probable—the equiprobable variables, as we may say. But might we not also write the equation in either of the following forms
\[
(x/a + y/b) = 1 = 0,
\]
and take \( a \) and \( b \) in either system as the equiprobable variables? To be sure, if the equal distribution of probabilities is extended to infinity we shall be landed in the absurdity that of the random lines passing through any point on the axis of \( y \) a proportion differing infinitesimally from unity—100%—are either (1) parallel or (2) perpendicular to the axis of \( x \). But if the probability values will render any scheme for the equal distribution of probabilities absurd. If Professor Crofton's constant \( \pi \), for example, becomes infinite, the origin being thus placed at an infinite distance, all lines are at once perpendicular to the axis of \( x \). But if the probability is finite, the probability values will render any scheme for the equal distribution of probabilities absurd. If Professor Crofton's constant \( \pi \), for example, becomes infinite, the origin being thus placed at an infinite distance, all lines are at once perpendicular to the axis of \( x \).

80. However this may be, Professor Crofton's conception has the distinction of leading to a series of interesting propositions, of which some are here subjoined. \(^4\) The number of random lines which meet any given convex contour of length \( L \) is measured by the area of the centroid of \( L \) whose origin is at the point of contact, and the position, for \( b \), from 0 to \( b \), the perpendicular on the tangent to the contour, we have \( \pi \), taking this through four right angles for \( \theta \), we have
\[
1 \text{As recorded by Czuber, Geometrische Wahrscheinlichkeiten, p. 90.}

2 \text{Cf. Bertrand, Calcul des probabilités, pp. 4 seq. The matter has been much discussed in the Educational Times. See Mathematical Questions \ldots from the Educational Times [a reprint], xxii, 17-39, containing references to earlier discussions, e.g. x. 33 (by Woolhouse).}

3 \text{Loc. cit. § 75.}

4 \text{The whole of p. 787 of Morgan Crofton's article is often referred to, and parts of pp. 786, 788 are transferred here. By Legendre's theorem on rectification, N being the measure of the number of lines,}
\[
N = \int_0^L \omega d\omega = L^3.
\]
Thus, if a random line meet a given contour, of length \( L \), the chance of its meeting another convex contour, of length \( l \), internal to the former is \( p = l/L \). If the given contour be not convex, or not closed, \( N \) will evidently be the length of an endless string, drawn tight around the contour.

81. If a random line meet a closed convex contour of length \( L \), the chance of it meeting another such contour, external to the former, is \( (X-Y)/L \), where \( X \) is the length of an endless band enveloping both contours, and crossing between them, and \( Y \) is a part of a band also enveloping both, but not crossing. This may be shown by means of Legendre's integral above; or as follows:

Call, for shortness, \( N(A) \) the number of lines meeting an area \( A \); \( N(A, A') \) the number which meet both \( A \) and \( A' \); then (1)
\[
N(SROPH) + N(S'Q'OR'P'H') - N(SROPH + S'Q'OR'P'H') = f + N(SROPH, S'Q'OR'P'H') - f - N(SROPH, S'Q'OR'P'H')
\]
since in the first member each line meeting both areas is counted twice. But the number of lines meeting the non-convex figure consisting of \( QOPHSQ \) and \( Q'S'H'P'R'Q' \) is equal to the band \( Y \), and the number meeting both these areas is identical with that of those meeting the given areas \( A, A' \); hence \( X^2 = N(G, A, A') \). The number meeting both the given areas is measured by \( X - Y \). Hence the theorem follows.

82. Two random chords cross a given convex boundary, of length \( L \), and area \( \Omega \); to find the chance that their intersection falls inside that boundary.

Consider the first chord in any position; let \( C \) be its length; considering it as a closed area, the chance of the second chord meeting it is \( 2C/L \); and the whole chance of its coordinates falling in \( dp, d\omega \) of the second chord meeting it in that position is
\[
\int dpd\omega = 2C/L dpd\omega \]
But the whole chance is the sum of these chances for all its positions;
\[
\int dpd\omega = 2L C dpd\omega \]
Now, for a given value of \( \omega \), the value of \( \int dp \) is evidently the area \( \Omega \); then, taking \( \omega \) from \( \pi \) to 0, we have required probability \( = \pi \Omega L^2 \).

The mean value of a chord drawn at random across the boundary is
\[
M = \frac{\int dpd\omega}{\int dpd\omega} = \frac{\Omega}{\pi L^2}.
\]
83. A straight band of breadth \( c \) being traced on a floor, and a circle of radius \( r \) thrown on it at random; to find the mean area of the band which is covered by the circle. (The cases are omitted where the circle falls outside the band.)

If the axis of \( x \) be covered, the chance that a random point on the circle falling on the band is \( p = M(S)/\pi r^2 \), this is the same as
\[\text{This result also follows by considering that, if an infinite plane be covered by an infinity of lines drawn at random, it is evident that the number of lines which meet a given finite straight line is proportional to its length, and is the same whatever be its position. Hence, if we take \( l \) the length of the line as the measure of this number, the number of random lines which cut any element \( ds \) of the contour is measured by \( ds \), and the number which meet the contour is therefore measured by \( l ds \), half the length of the boundary. If we take \( \omega \) as the measure for the line, the measure for the contour will be \( L \); as above. Of course we have to remember that each line must meet the curve twice. It would be possible to rectify any closed curve by means of this principle. Suppose it traced on the surface of a circular disc, of circumference \( L \), and the disc thrown a great number of times on a system of parallel lines, whose distance asunder equals the diameter, if we count the number of cases in which the closed curve meets one of the parallels, the ratio of this number to the whole number of trials will be ultimately the ratio of the circumference of the curve to that of the circle. [Morgan Crofton's note.]
4 Or the floor may be supposed painted with parallel bands, at a distance asunder equal to the diameter; so that the circle must fall on one.

FIG. 1.
if the circle were fixed, and the band thrown on it at random. Now let \( A \) (fig. 2) be a position of the random point; the favourable cases are when HK, the bisector of the band, meets a circle, centre \( A \), radius \( \frac{h}{2} \); and the whole number are when HK meets a circle, centre \( O \), radius \( r + \frac{h}{2} \); hence the probability is

\[
\frac{p = \pi (r + h/2)^2}{2\pi(r + h/2)^2} = \frac{1}{2}.
\]

This is constant for all positions of \( A \); hence, equating these two values of \( p \), the mean value required is \( M(S) = (C(2r + h)^2)/2\pi \).

The mean value of the portion of the circumference which falls on the band is the same fraction \( c/(2r + h) \) of the whole circumference.

If any convex area whose surface is \( S \) and circumference \( L \) be thrown on the band, instead of a circle, the mean area covered is

\[
M(S) = \frac{L}{\pi(2r + h)^2}.
\]

For as before, fixing the random point at \( A \), the chance of a random point in \( \Omega \) falling on the band is \( p = \pi \cdot \frac{h}{2}/L' \), where \( L' \) is the perimeter of a parallel curve to \( L \), at a normal distance \( \frac{h}{2} \) from it. Now

\[
L' = L + 2\pi \cdot \frac{h}{2}.
\]

84. Buffon's problem may be easily deduced in a similar manner. Thus, if \( 2r \) = length of line, \( a \) = distance between the parallels, and we conceive a circle of diameter \( a \) with its centre at the middle \( O \) of the line, rigidly attached to the latter, and thrown with it on the parallels, this circle must meet one of the parallels; if it be thrown an infinite number of times we shall thus have an infinite number of chords across it at random. Their number is measured by \( 2\pi \cdot \frac{a}{2} \), and the number which meet \( 2r \) is measured by \( 2\pi \cdot \frac{a}{2r} \). Hence the chance that the line \( 2r \) meets one of the parallels is \( p = 4\pi/\pi a \).

85. To investigate the probability that the inclination of the line joining any two points in a given convex area \( \Omega \) shall lie within given limits, we give here a method of reducing this question to calculation, for the sake of an integral to which it leads, and which is not easy to deduce otherwise.

First let one of the points \( A \) (fig. 4) be fixed; draw through it a chord \( PO = C \), at an inclination \( \theta \) to some fixed line; put \( AP = \delta \), \( AQ = \alpha \); then the number of cases for which the direction of the line joining \( A \) and \( B \) lies between \( \theta \) and \( \theta + \delta \) is measured by \( \int_0^{\delta} \int_0^{2\pi} \cos \phi \cos \psi d\phi d\psi \).

\[
\text{the integral } \int_0^{\delta} \int_0^{2\pi} \cos \phi \cos \psi d\phi d\psi
\]

is the mean value of the tangent \( \delta \) at a point of angle \( \theta \).

86. If there be any two convex boundaries (fig. 5) so related that a tangent at any point \( T \) to the inner cuts off a constant segment \( S \) from the outer (e.g. two concentric rings), let the annular area between them be called \( A \); from a point \( X \) taken on the annulus draw tangents \( AX, XB \) to the inner. The mean value of the area \( M(AB) = \pi L \), being the whole length of the inner curve \( AB \).

The following lemma will first be proved:

If there be any convex arc \( AB \) (fig. 6), and if \( N_1 \) be (the measure) of the number of random lines which meet it once, \( N_2 \) the number which meet it twice,

\[
2 \text{arc } AB = N_1 + 2N_2.
\]

Now fix the point \( X \), in fig. 5, and draw \( AX, XB \). If a random line cross the boundary \( L \), and \( p_1 \) be the probability that it meets the arc \( AB \) once, \( p_2 \) that it does so twice,

\[
2 \text{arc } AB = p_1 + 2p_2;
\]

and if the point \( X \) range all over the annulus, and \( p_1, p_2 \) are the same probabilities for all positions of \( X \),

\[
2\text{M(AB)/L = } p_1 + 2p_2.
\]

Let new IC (fig. 7) be any position of the outer boundary line; draw tangents \( IC, t \) at \( \theta \) and \( \theta + \delta \), so that the inclination of the line joining \( A \) and \( B \) lies between \( \theta \) and \( \theta + \delta \) is measured by \( \int_0^{\delta} \int_0^{2\pi} \cos \phi \cos \psi d\phi d\psi \).

The above result may be expressed as an integral. If \( A \) be the arc \( AB \) included by tangents from any point \((x, y)\) on the annulus,

\[
\int d\delta d\psi = \text{LS}.
\]

It has been shown (Phil. Trans., 1868, p. 191) that if \( \theta = \frac{1}{2} \) the angle between the tangents \( AX, XB \),

\[
\int d\delta d\psi = \pi(A + 2B).
\]

The mean value of the tangent \( \delta \) at a point of angle \( \theta \).

87. When we go on to species of three dimensions further speculative difficulties occur. How is a random line through a given point to be defined? Since it is usual to define a vector by two numbers, the angle made with the axis \( X \) by a vector \( r \) in the plane \( XY \), and \( \theta \) (or \( y + \theta \)) the angle made by the vector \( r \) with \( r \) in the plane containing both \( r \) and \( r \) and the axis \( Z \) it seems natural to treat the angles \( \phi \) and \( \theta \) as the equiprobable variables. In other words, we take at random any point on the celestial globe and combine it with any right ascension the vector joining the centre to the point thus assigned is a random line. It is possible that for some purposes this conception may be appropriate. For many purposes it is proper to assume a more symmetrical distribution of the terminal points on the surface of a sphere, a distribution such that each element of the surface shall contain an approximately equal number of points. Such an assumption is usually similar in the kinetic theory of molecules with respect to the distribution of the line joining the centres of two colliding spheres in a "molecular chaos." It is safe to say with Cruber, "No discussion can remove indeterminateness." Let us hope with him that "the branch of probability has an important place only a theoretic interest, in the future it will perhaps lead to practical results."
P, taken at random on A, falling on S, \( p = S/A \). If now the space S be variable, and M(S) be its mean value

\[ p = M(S)/A. \]

For, if we suppose S to have \( n \) equally probable values \( S_1, S_2, S_3 \ldots \), the chance of any one \( S_i \) being taken, and of \( P \) falling on \( S_i \), is

\[ p_i = m_i/S_i; \]

now the whole probability \( p = p_1 + p_2 + p_3 + \ldots \), which leads at once to the above expression. The chance of two points falling on S is, in the same way,

\[ p = M(S^2)/A^2, \]

and so on.

In such a case, if the probability be known, the mean value follows, and vice versa. Thus, we might find the mean value of the \( n \)th power of the distance XY between two points taken at random in a line of length l, by considering the chances that, if \( n \) more points are so taken, they shall all fall between X and Y. This chance is

\[ M(XY)^n = l^2/(n+1)^2[(n+1)^2 - 4]; \]

for the chance that X shall be one of the extreme points, out of the whole \( (n+2) \), is \( 2(2n+2) \); and, if it is the chance that the other extreme point, Y, is \( (n+1)^2 \). Therefore

\[ M(XY)^n = 2l^2/(n+1)^2[(n+1)^2 - 4]. \]

A line is divided into \( n \) segments by \( n-1 \) points taken at random; to find the mean value of the product of the \( n \) segments. Let a, b, c, \ldots be the segments in one particular case. If \( n \) new points are taken at random in the line, the chance that one falls on each segment is

\[ 1 \cdot 2 \cdot 3 \ldots nabc \ldots /n^2 \cdot M(abc \ldots). \]

Hence the chance that this occurs, however the line is divided, is

\[ n^2 - M(abc \ldots) \]

Now the whole number of different orders in which the whole \( 2n-1 \) points may occur is \( (2n-1)! \); out of these the number in which one of the first series falls between every two of the second is easily found by the theory of permutations to be \( n!(n-1)! \). Hence the required mean value of the product is

\[ M(abc \ldots) = (n-1)!/(2n-1)! \cdot p^n. \]

8g. Additional examples of the relation between probability and expectation appear in the following series of propositions:

(1) If M be the mean value of any quantity depending on the positions of two points (e.g., their distance) which are taken in a space A, the other in a space B (external to A); and if M be the mean value of points in space A and B, respectively, then

\[ (A+B)M = 2AMB + AMB + BMA. \]

If the space A = B, \( 4M = 2M + M + M \); if, also, \( M = M_x \), then \( 2M = M + M \).

(2) The mean distance of a point P within a given area from a fixed straight line (which does not meet the area) is evidently the distance of the centre of gravity G of the area from the line. Thus, if A, B are two fixed points on a line outside the area, the mean value of the area of the triangle ABC, from this it will follow that, if X, Y, Z are three points taken at random in three given spaces on a plane (such that they cannot all be cut by any straight line), the mean value of the area of the triangle XYZ is the triangle G'M'G', determined by the three centres of gravity of the spaces.

(3) This proposition is of use in the solution of the following problem:

Two points X, Y are taken at random within a triangle. What is the mean area M of the triangle XYZ, formed by joining them with one of the angles of the triangle?

Bisect the triangle by the line CD; let \( M_1 \) be the mean value when both points fall in the triangle ACD, and \( M_2 \) the value when one falls in ACD and the other in BCD; then \( 2M = M_1 + M_2 \). But \( M_1 = M \); and \( M_2 = GG'G' \), where G, G' are the centres of gravity of ACD, BCD; hence \( M = \frac{1}{2}ABC \), and \( M = \frac{1}{2}ABC \).

(4) In all these cases we pass to probabilities. The chance that a new point Z falls on the triangle XYZ is \( \frac{1}{2} \); and the chance that three points, X, Y, Z taken at random, form a triangle, with a vertex C, a re-entrant quadrilateral, is \( \frac{1}{4} \frac{1}{4} \).

90. The calculation of geometrical probability and expectation is much facilitated by the following general principle: If M be a mean value depending on the positions of \( n \) points falling on a space A; and if this space receive a small increment \( a \), and \( M' \) be the same mean when \( n \) points are taken on \( A-a \), and \( M \) the same mean when one point falls on \( A \) and the remainder on \( A \); then, the sum of all the cases being \( M'(A+a) \), and this consisting of the cases (1) when all the points are on \( A \), (2) when one is on \( A \) and the others on \( A \) (as we may neglect all where two or more fall on \( A \)), we have

\[ M'(A+a) = M'(A) + M(A-a); \]

\[ M'(M-M)A = M'(A-M)_A. \]
putting \( r = \text{OH}, r^* = \text{OK} ; \) as \( r = 2a \sin \theta, r^* = 2a \sin \psi, \)
\[
M_1 = \frac{(2a)^2}{a^2} \int_0^a \sin \theta \sin \psi' \sin(\theta - \theta') d\theta d\theta'.
\]
Professor Sylvester has remarked that this double integral, by means of the theorem
\[
\int_0^a \int_0^a \sin \theta' \sin \psi' \
\cos \theta' d\theta' d\theta' = \frac{1}{2} \int_0^a \sin \psi d\psi = 12 \cdot 4 = 6 \cdot 8.
\]
From this mean value we pass to the probability that four points within a circle shall form a re-entrant figure, viz.
\[
p = \frac{35}{12\pi^2}.
\]
94. The function of expectation in this class of problem appears to afford an additional justification of the position here assigned to this conception as distinguished from an average in the more general sense which is proper to the following Part.

**PART II.—AVERAGES AND LAWS OF ERROR**

95. Averages.—An average may be defined as a quantity derived from a given set of quantities by a process such that, if the constituents become all equal, the average will coincide with the constituents, and the constituents not being equal, the average is greater than the least and less than the greatest of the constituents. For example, if \( x_1, x_2, \ldots, x_n \) are the constituents, the following expressions form averages (called respectively the arithmetic, geometric and harmonic means):
\[
\frac{x_1 + x_2 + \ldots + x_n}{n},
\]
\[
\sqrt[n]{x_1 x_2 \ldots x_n},
\]
\[
\frac{1}{\frac{1}{x_1} + \frac{1}{x_2} + \ldots + \frac{1}{x_n}}.
\]
The conditions of an average are likewise satisfied by innumerable other symmetrical functions, for example:
\[
\left(\frac{x_1^3 + x_2^3 + \ldots + x_n^3}{n}\right)^{1/3}
\]
The conception may be extended from symmetrical to symmetrical functions by supposing any one or more of the constituents in the former to be repeated several times. Thus if in the first of the averages above instance (the arithmetic mean) the constituent \( x_n \) occurs \( t \) times, the expression is to be modified by putting \( t x_n \) for \( x_n \) in the numerator, and in the denominator, for \( n, n-t+1 \). The definition of an average covers a still wider field. The process employed need not be a function. One of the most important averages is formed by arranging the constituents in the order of magnitude and taking for the average a value which has as many constituents above it as below it, the median. The designation is also extended to that value about which the greatest number of the constituents cluster most closely, the “centre of greatest density,” or (with reference to the geometrical representation of the grouping of the constituents) the greatest ordinate, or, as recurring most frequently, the mode. But to comply with the definition there must be added the condition that the mode does not occur at either extremity of the range between the greatest and the least of the constituents. There should be also in general added a definition of the process by which the mode is derived from the given constituents. Perhaps this specification may be dispensed with when the number of the constituents is indefinitely large. For then it may be presumed that any method of determining the mode will lead to the same result. This presumption presupposes that the constituents are quantities of the kind which form the sort of “series” which is proper to Probabilities. A similar presumption is made to be respected with the constituents of the other averages, so far as they are objects of probabilities.

96. The Law of Error.—Of the propositions respecting average with which Probabilities is concerned the most important are those which deal with the relation of the average to its constituents, and are commonly called “laws of error.” Error is defined in popular dictionaries as “deviation from truth”; and since truth commonly lies in a mean, while measurements are some too large and some too small, the term in scientific dictum is extended to deviations of statistics from their average, even when that average—like the mean of human or barometric heights—does not stand for any real objective thing. A “law of error” is a relation between the extent of a deviation and the frequency with which it occurs; for instance, the proposition that if a digit is taken at random from mathematical tables, the difference between that figure and the mean of the whole series (indefinitely prolonged) of figures so obtained, namely, \( 4.5 \) will in the long run prove to be equally often \( \pm 0.5, \pm 1.5, \pm 2.5, \pm 3.5 \), etc. The assignment of frequency to discrete volumes is, as often, 

97. Laws of Frequency.—What other laws of error may require notice are included in the wider genus “laws of frequency,” which forms the subject of the second section. Laws of frequency, so far as they belong to the domain of Probabilities, relate much to the same sort of grouped statistics as laws of error, but do not, like them, connote an explicit reference to an average. Thus the sequence of random digits above instance as affording a law of error, considered without reference to the mean value, presents the law of frequency that one digit occurs as often as another (in the long run). Every law of error is a law of frequency: but the converse is not true. For example, it is a law of frequency—discovered by Professor Pareto—that the number of incomes of different size (above a certain size) is approximately represented by the equation \( y = \frac{A}{x^a} \), where \( y \) denotes the size of an income, \( x \) the number of incomes of that size. But whether this generalization can be construed as a law of error (in the sense here defined) depends on the nice inquiry whether the point from which the frequency diminishes as the number increases can be regarded as a “mode,” or diminishing as \( x \) increases from that point.
Section I.—The Law of Error.

The Normal Law of Error.—The simplest and best recognized statement of the law of error, often called the "normal law," is the equation

\[ z = \frac{1}{\sqrt{2\pi}} \exp\left(-\frac{(x-a)^2}{2\sigma^2}\right) \]

where \( x \) is the magnitude of an observation or "statistic," \( z \) is the proportionality of observations measuring \( x, \) \( a \) is the arithmetic mean of the group (supposed indefinitely \( \infty \) multiplied), and \( \sigma \) is the constant sometimes called the "modulus" proper to the group; and the equation signifies that if any large number \( N \) of such a group is taken at random, the number of observations between \( x \) and \( x + \Delta x \) is (approximately) equal to the right-hand side of the equation multiplied by \( N \Delta x. \) A graphical representation of the corresponding curve—sometimes called the "probability-curve"—is here given (fig. 10), showing the general shape of the curve, and how its dimensions vary with the magnitude of the modulus \( \sigma. \) The area being constant (viz. unity), the curve is furled up when \( \sigma \) is small, spread out when \( \sigma \) is large. There is added a table of integrals, corresponding to areas subtended by the curve; in a form suited for calculations of probability, the variable, \( r, \) being the length of the abscissa referred to (divided by) the modulus. It may be noted that the points of inflexion in the figure are each at a distance from the origin of \( 1/2 \) modulus, a distance equal to the square foot of the mean square of error—often called the "standard deviation." Another notable value of the abscissa is that which divides the area either on the side of the origin into two equal parts; commonly called the "probable error." The value of \( r \) which corresponds to this point is 0.4769.

98. (1) The Normal Law of Error. — The simplest and best recognized statement of the law of error, often called the "normal law," is the equation

\[ z = \frac{1}{\sqrt{2\pi}} \exp\left(-\frac{(x-a)^2}{2\sigma^2}\right) \]

where \( x \) is the magnitude of an observation or "statistic," \( z \) is the proportionality of observations measuring \( x, \) \( a \) is the arithmetic mean of the group (supposed indefinitely \( \infty \) multiplied) of similar statistics; \( c \) is a constant sometimes called the "modulus" proper to the group; and the equation signifies that if any large number \( N \) of such a group is taken at random, the number of observations between \( x \) and \( x + \Delta x \) is (approximately) equal to the right-hand side of the equation multiplied by \( N \Delta x. \) A graphical representation of the corresponding curve—sometimes called the "probability-curve"—is here given (fig. 10), showing the general shape of the curve, and how its dimensions vary with the magnitude of the modulus \( c. \) The area being constant (viz. unity), the curve is furled up when \( c \) is small, spread out when \( c \) is large. There is added a table of integrals, corresponding to areas subtended by the curve; in a form suited for calculations of probability, the variable, \( r, \) being the length of the abscissa referred to (divided by) the modulus. It may be noted that the points of inflexion in the figure are each at a distance from the origin of \( 1/2 \) modulus, a distance equal to the square foot of the mean square of error—often called the "standard deviation." Another notable value of the abscissa is that which divides the area either on the side of the origin into two equal parts; commonly called the "probable error." The value of \( r \) which corresponds to this point is 0.4769.

100. There is, however, one class of phenomena to which Herschel's reasoning applies without reservation. In a "molecular chaos," such as the received kinetic theory of gases postulates, if a molecule be supposed to be in a given place at a given time, it is clear that from that point in a given time, driven hither and thither by colliding molecules, is regarded as an "error," it may be presumed that errors in all directions are equally probable and errors in perpendicular directions are independent. It is remarkable that a similar supposition with respect to the velocities of the molecules was employed by Clerk Maxwell, in his first approach to the theory of molecular motion, to establish the law of error in that region.

The Laplace-Quetelet Hypothesis.—This presumption has, indeed, not received general assent; and the law of error appears to be better stated on a proof which was originated by Laplace. According to this view, the normal law of error is a first approximation to the law of association with which different values are apt to be assumed by a variable magnitude dependent on a great number of independent variables, each of which assumes different values in random fashion over a limited range, according to a law of error, not in geometric progression, nor in the exponential law, but whose geometrical form is the same as the normal law of error. The normal law prevails in nature because it often happens—in the world of atoms, in organic and in social life—that things depend on a number of independent agencies. Laplace, indeed, appears to have applied the mathematical principle on which this explanation depends only to examples of the law of error (artificially generated by the process of taking averages. The merit of accounting for the prevalence of the law in rerum natura belongs rather to Deucalion. He, however, employed too simple a formula for the action of the causes. The hypothesis seems first to have been stated in all its generality both of mathematical theory and statistical exemplification by Glashier.

The validity of the explanation may be best tested by first (A) deducing the law of error from the condition of numerous independent causes; and (B) showing that the law is adequately fulfilled in a variety of concrete cases, in which the condition is probably present. The condition may be supposed to be perfectly fulfilled in games of chance, or, more generally, sortitions, characterized by the circumstance that we have a knowledge prior to specific occurrence of the proportion of what Laplace calls favourable cases to all cases—a category which includes, for instance, the distribution of digits obtained by random extracts from mathematical tables, as well as the distribution of the numbers of the different elements on a domino.

The genesis of the law of error is most clearly illustrated by the simplest sort of "game," that in which the sortition is between two alternatives, heads or tails, hearts or not-hearts, or, generally, that in which the success or failure of a process is being p and that of a failure q, where \( p + q = 1. \) The number of such successes in the course of n trials may be considered as an aggregate made up of n independently varying elements, each of which assumes the values 0 or 1 with respective frequency p and q. The frequency of each value of the
aggregated is given by a corresponding term in the expansion of $(q+p)$, and by a well-known theorem this term is approximately equal to \( \frac{1}{\sqrt{2\pi npq}} \); where \( n \) is the number of integers by which the term is distant from \( np \) (or an integer close to \( np \)); provided that \( n \) is of \( (\sqrt{n} - 1)^2 \) order \( \approx n \). Graphically, let the solid curve be the probability density function \( f(x) \) and the dotted curve be the probability of its stopping at any neighbouring point within a range of \( \pm \sqrt{n} \) is given by the above-mentioned law of frequency, \( n \) being the distance of the stopping-point from \( np \). Put \( n = x + 2npq \approx \sqrt{c^2} \); then the probability may be \( \frac{1}{\sqrt{2\pi}} \).

It is a short step, but a difficult one, from this in which the element is binomial—heads or tails— to the general case, in which the element has several values, according to the law of frequency—consists, for instance, of the number of points present—or centres of gravity. Taking for example, a die, and assuming the probability of its stopping at any neighbouring point within a range of \( \pm \sqrt{n} \) is given by the above-mentioned law of frequency, \( n \) being the distance of the stopping-point from \( np \). Put \( n = x + 2npq \approx \sqrt{c^2} \); then the probability may be \( \frac{1}{\sqrt{2\pi}} \).

The square brackets denote that the integrations extend between the extreme limits of the element's range, for the frequency-locus for each element is continuous, it being understood that \( \int f(x)dx = 1 \), and \( k \) is the sum of the mean squares of error for each element.

The rule equally applies to the case in which the elements are not similar; or to the case where the number of points on a die, or the number of integers by which the term is distant from \( np \), is of \( (\sqrt{n} - 1)^2 \) order \( \approx n \). Graphically, let the solid curve be the probability density function \( f(x) \) and the dotted curve be the probability of its stopping at any neighbouring point within a range of \( \pm \sqrt{n} \) is given by the above-mentioned law of frequency, \( n \) being the distance of the stopping-point from \( np \). Put \( n = x + 2npq \approx \sqrt{c^2} \); then the probability may be \( \frac{1}{\sqrt{2\pi}} \).

105. Variant Proofs.—The evidence of these statements can only be indicated here. All the proofs which have been offered involve some postulate as to the deviation of the elements from their respective centres of gravity, and thereby extend to infinity, it might well happen that the law of error would not be fulfilled by a sum of such elements.

The necessary and sufficient postulate appears to be that the mean powers of deviation of the elements would be written as being equal to the ratio of the first, fourth, &c., powers (up to some assigned power), to be finite, and should be finite.

106. (1) The proof which seems to flow most directly from this postulate proceeds thus. It is deduced that the mean powers of deviation of the elements would be written as being equal to the ratio of the first, fourth, &c., powers (up to a certain power), to be finite, and should be finite.

107. (2) The earliest and best-known proof is that which was originated by Laplace and generalized by Poisson. Some idea of this celebrated theory may be obtained from the following two theorems, applied to a simple case. The case is that in which all the elements have one and the same locus of frequency, and that locus is symmetrical about the centre of gravity. Let the locus be represented by the equation \( y = \phi(x) \), and where the centre of gravity is the origin, and \( \phi(+) = \phi(-) \); the construction signifying that the probability of the element having a value \( \pm \) between \( -\Delta x \) and \( +\Delta x \) is \( \phi(\Delta x) \). Square brackets denoting summation between extreme limits, put \( \chi(\Delta x) \). The coefficient of \( x^2 \) in \( \chi(\Delta x) \) is the probability that the sum of \( x^2 \) of the values of the \( m \) elements is equal to \( x^2 \); a probability which is equal to \( \Delta xy \), where \( y \) is the ordinate of the locus representing the frequency of the quantity (formed by the sum of the elements). Owing to the symmetry of the function \( \phi(x) \), the value of \( \Delta y \) will not be altered if we substitute \( x^2 \) for \( x^2 \), or if we substitute \( x^2 + \lambda x^2 \), etc.

The coefficient of \( x^2 \) in \( \chi(\Delta x) \) is the probability of the square of the deviation of the element from the mean. If the symbol \( \Delta y \) is used to denote absolute magnitude, abstraction being made of sign.

1. Below, pars. 150, 160.
2. Laplace, Théorie analytique des probabilités, bk. ii. ch. iv.; Poisson, Recherches sur la probabilité des jugements. Good estimates of this proof are given by Todhunter, History . . . of Probability and by Cebrer, Theorie der Beobachtungsgeräte, art. 38 and Th. 2, § 4.
3. Some idea of this celebrated theory may be obtained from the following two theorems, applied to a simple case. The case is that in which all the elements have one and the same locus of frequency, and that locus is symmetrical about the centre of gravity. Let the locus be represented by the equation \( y = \phi(x) \), and where the centre of gravity is the origin, and \( \phi(+) = \phi(-) \); the construction signifying that the probability of the element having a value \( \pm \) between \( -\Delta x \) and \( +\Delta x \) is \( \phi(\Delta x) \). Square brackets denoting summation between extreme limits, put \( \chi(\Delta x) \). The coefficient of \( x^2 \) in \( \chi(\Delta x) \) is the probability that the sum of \( x^2 \) of the values of the \( m \) elements is equal to \( x^2 \); a probability which is equal to \( \Delta xy \), where \( y \) is the ordinate of the locus representing the frequency of the quantity (formed by the sum of the elements). Owing to the symmetry of the function \( \phi(x) \), the value of \( \Delta y \) will not be altered if we substitute \( x^2 \) for \( x^2 \), or if we substitute \( x^2 + \lambda x^2 \), etc.
PROBABILITY

108. (3) De Forest has given a proof unencumbered by imagination of what is the fundamental proposition in Laplace’s theory that, if a polynomial of the form

\[ A_0 + A_1 z + A_2 z^2 + \ldots + A_n z^n \]

be raised to the nth power and expanded in the form

\[ B_0 + B_1 z + B_2 z^2 + \ldots + B_m z^m \]

then the magnitudes of the B’s in the neighborhood of their maximum (say \( A_n \)) will be in accord in accordance with a "probability-curve." or normal law of error.

109. (4) Professor Morgan Crofton’s original proof of the law of error is based on a datum obtained by observing the effect which the introduction of a new element produces on the frequency-locus for the aggregate of elements. It seems to be assumed, very properly, that the sought function involves as constants some at least of the mean powers of the aggregate, in particular the mean second power, say \( A\), and the mean square of the frequency, \( B\), (and accordingly the aggregate) to its respective centre of gravity. Then if \( f(x)\) is the ordinate of the frequency-locus for the aggregate before taking in a new element, and \( y = dy\) the ordinate after that operation, by a well-known principle, \( y = y^2 = [S^2 f(x)](x - \Delta x)\), where \( y = \phi_f(x)\), is the frequency-locus for the new element, and the square brackets indicate that the summation is to extend over the whole range of values assumed by that element. Expanding in ascending powers of (each value of) \( y\) and neglecting powers above the second, as is found to be legitimate under the conditions specified, we have (since the first mean power of the element vanishes)

\[ dy = S^2 f(x) dx \]

From the fundamental proposition that the mean square for the aggregate equals the sum of mean squares for the elements it follows that \( S^2 f(x) dx \) the mean second power of deviation for the \( j\)th element is equal to \( \Delta j\), the addition to \( k\) the mean second power of deviation for the aggregate. There is thus obtained a partial differential equation of the second kind.

\[ \frac{dy}{dx} = \frac{dy}{\Delta x} \]

A subsidiary equation is (in effect) obtained by Professor Crofton from the property that if the unit according to which the axis of \( x\) is graduated is in any assigned ratio, there must be a corresponding change of the ordinate, the frequency of the aggregate and of the mean square of deviation for the aggregation. By supposing the alteration indefinitely small he obtains a second partial differential equation, viz. (in the notion here adopted)

\[ y + \frac{dy}{dx} + 2k = 0 \]

From these two equations, regard being had to certain other conditions of the problem, it is deductible that \( y = C e^{-x^2/k}\) where \( C\) is a constant of which the value is determined by the condition that

\[ \int_{-\infty}^{\infty} y dx = 1 \]

110. (5) The condition on which Professor Crofton’s proof is based may be called differential, as obtained from the introduction of a single new element; the aggregate is obtained from the introduction of a whole set of new elements. For let \( A\) be the sum of \( m\) elements, fluctuating according to the sought law of error. Let \( B\) be the sum of another set of elements \( m\) in number (the elements being larger). Then \( C\) a quantity formed by adding together each pair of concurrent values presented by \( A\) and \( B\) must also conform to the law of error, since \( B\) is the sum of \( m\) elements. The general form which satisfies this condition of reproduhtively is limited by other conditions to the normal law of error.

111. The list of variant proofs is not yet exhausted, but enough has been said to establish the proposition that a sum of numerous elements of the kind described will fluctuate approximately according to the normal law of error.

112. As the number of elements is increased, the constant above designated \( k\) continually increases; so that the curve representing the frequency of the compound magnitude spreads out from its center. It is otherwise if instead of the simple sum we consider the linear function formed by adding the elements each multiplied by \( 1/m\). The spread of the average thus constituted will continually diminish as the number of the elements is increased; the sides closing in as the

\[ \text{vertex rises up}. \]

The change in “spread” produced by the accession of new elements is illustrated by the transition from the high to the low curve, in fig. 10, in the case of a sum; in the case of an average (arithmetic mean) by the reverse relation.

The proposition which has been proved for linear functions may be extended to any other function of numerous variables, each representing the value assumed by an independently fluctuating element; if the function may be expanded into ascending powers of the variables according to Taylor’s theorem, and all the powers after the first may be neglected. The matter is not so simple as it is, often represented, when the variable elements may assume large, perhaps infinite, values. The aid of the postulate above-mentioned the difficulty can be overcome.

114. All the proofs which have been noticed have been extended to errors in two (or more) dimensions. Let \( Q\) be the sum of a number of elements of the various values according to a law of frequency \( f(x, y)\), the functions being in general different for different elements.

The extension to two or more dimensions. The case where \( Q\) assumes values of the variables between \( x + \Delta x\) and between and \( y + \Delta y\) is \( \Delta y = x\Delta x\), if

\[ z = \frac{1}{2} \exp \{m(x - a)^2 - 2(x - a)(q - b) + (y - b)^2\} \]

where, as in the simpler case, 

\[ z = \sigma = \phi, \]

being the arithmetic mean of the values of \( x\) assumed in the long run by one of the elements, \( b\) the corresponding sum for values of \( y\), and

\[ \int_{0}^{\pi} \int_{0}^{\pi} \exp \{ - (r - \rho)^2 / 2 \} \]
The maximum frequency is, as it ought to be, at the point \( x = 6 \), \( y = 6 \). The density is particularly great along a line through that point, making \( 45^\circ \) with the axis of \( x \); particularly small in the complementary direction. This also is as it ought to be. For if the centre is made the origin by substituting \( x \) for \( x-a \) and \( y \) for \( y-b \), and then new co-ordinates \( X \) and \( Y \) are taken, making an angle \( \theta \) with \( x \) and \( y \) respectively, the curve which is traced on the plane of \( ZX \) by its intersection with the surface is of the form

\[
Z = \exp[-X^2/2] \cos \theta \sin \theta - 2 \cos \theta \sin \theta + m \cos \theta \theta/(2bm - F),
\]

a probability-curve which will be more or less spread out according as the factor \( k \) is greater or less, where \( k \) is a number which is determined by the magnitude of the deviation from the normal one; namely, that is, the present case, where \( k = m \), a minimum when \( \theta = 0 \) and a maximum when \( \theta = \pi \).

</table>

117. Having deduced the law of error from ideal conditions such as are attributed to perfectly fair games of chance, we have next to inquire into the common error. It is obtained in the conventional manner.

118. Among important concrete cases is that of the law of error. In a leading hand, the law of error is described by the hypothesis that the error is the algebraic sum of the number of deviations from the central position of the system of weights, each of which has zero for its central position and is subject to no other forces than those of the atmosphere, the different parts of the instrument, etc., evidently depend on a great number of causes, while each contributes to the actual error. The second assumption seems to be frequency laws, and is shown to be quite a different law. This assumption applies not only to the fallible perceptions of the senses, but also to impressions into which a large ingredient of inference enters, such as estimates of a man's height or weight from his appearance, and even higher acts of judgment. Aiming at an object is an act of judgment, to measure an object, misperception is but one of the many causes of mistakes; and, accordingly, if it is found that shots aimed at the same bull's-eye are apt to be distributed according to the normal law, whether in two dimensions on a target and according to their horizontal deviations, as exhibited below (p. 156), the conclusion that the assumption involved is the same as the law of error is supported by the evidence of physical as well as social, in which the normal law of error makes its appearance, presumably in consequence of the action of numerous independent influences. Well-known instances are the irregularities of the vital movements of the body, as respiration, pulse, and body temperatures, as tabulated by Quelet and others. Professor Pearson has found that the normal curve is applicable within the limits of random sampling the distribution of the chief characteristics of a great deal of phenomena. The tendency of social phenomena to conform to the normal law of frequency is well

---

5 Axioms of the law of error are derived from the hypothesis of independent causes; (2) that the function expressing that dependence can be treated as a linear function, by expanding in terms of ascending powers of the elements according to Taylor's theorem and neglecting higher powers, or otherwise. The first assumption seems to be frequency laws.
6 Miscelaneous Statistics.
A Variant Classification.

The division of concrete errors which has been proposed is not to be confounded with another twofold classification, namely, subjective and objective. The former, as a purely subjective thing, and such statistics as are not thus representative of something outside themselves, groups of which the mean is called "subjective." This division would be neither clear nor useful. One and the same real means are often only approximately equal to objective quantities. Thus the proportional frequency with which one face of a die—the six suppose—turns up is only approximately given by the objective fact that the six is one of a nearly perfect cube. For a set of dice with which Weldon experimented, the average frequency of a throw, presenting either five or six points, proved to be not \(3.43\), but \(3.337\). The difference of this result from the regulation \(5.5\) is as unpredictable from objective data, prior to experiment, as of the many means called subjective or fictitious. So the mean of errors of observation often differs from the thing observed by a so-called "constant error." So shots may be constantly deflected from the bull's-eye by a steady wind.

119. On the other hand, statistics, not portraying to represent a real object, have more or less close relations to magnitudes which cannot be described as fictitious. Where the items averaged are ratios, e.g., the proportion of births or deaths to the total population in several districts or other sections, it sometimes happens that the distribution of the ratios exactly corresponds to that which is obtained in the simplest games of chance—combinational distribution of the simplest type, with a real ascertainable relation between the number of "favourable cases" and the total number of cases. The most remarkable example of this property is presented by the mortality law of the male births of each year. Some other instances are given by Lexis and Westergaard. A similar correspondence between the actual and the "combinational" distribution has been found by Bortkovich in the case of very small probabilities. The error is no longer normal. And it is likely that some ratios—such as general death-rates—not presenting combinational distribution, might be broken up into subdivisions—such as death-rates for different occupations or age-groups—by a method that is more certain than the above.

121. Another sort of averages which is difficult to class as subjective rather than objective occurs in some social statistics, under the designation of index-numbers. The percentage which represents the deviation in the value of money between two epochs is seldom regarded as the mere average change in the price of several articles taken at random, but rather as the measure of something, e.g., the variation in the price of a given amount of commodities, or of a unit of commodity. So something substantive appears to be designated in the term of trade, or that of the consumption of the working classes, of which the growth is measured by appropriate index-numbers, the former due to Bourne and Sir Robert Giffen, this the latter by Venn.

122. But apart from these peculiarities, any set of statistics may be related to a certain quasimenu, very much of the same character as the object measured. That quasimenu is the limiting or ultimate mean to which the series of statistics, if indefinitely prolonged, would tend to converge, and in the limit it is a conception of a limit applying to any frequency-constant, to "c" for instance, as well as to "a" in the case of the normal curve. The given statistics may be treated as samples from which to reason up to the quasimenu, by that. Maxime of the calculus which determines the comparative probability of different causes from which an observed event may have emanated.

123. Thus it appears that there is a characteristic more essential to a quasimenu than the existence of an objective quasimenu, namely, the use of that method which is primarily, but not exclusively, proper to that sort of quasimenu—inverse probability. Without that deliberate instrument the doctrine of error can seldom be fully utilized; but some of its uses may be indicated before the introduction of technical difficulties.

124. Having established the prevalence of the law of error, we go on to the most unexpected presumption that whenever three or four independent causes co-operate, the law of error tends to be set up, has a certain speculative interest. The assumption of the law as a hypothesis is legitimate, but the experience that is apt to be turned to account. It is usefully applied to the practice of gunnery, to determine the proportion of shots which under assigned conditions will hit a zone of given size. The expenditure of ammunition required to hit an object can thence be inferred. Also the comparison between practice under different conditions is facilitated. In many kinds of examination it is found that the total score of a candidate is, for example, the sum of a lot of questions range approximately in conformity with the law of error. It is understood that the civil service examiners have founded on this fact some practical directions to examiners. Apart from this practical application, it is evident from our knowledge of a class of the measurable attributes of its members range in conformity with this general law. Something is added to the truth that "the days of man are three-score and ten," if we may regard that epoch, or more exactly for England, 72, as "Nature's aim," the length of life for which she builds a man, the dispersion on each side of this point being... nearly normal." So Horschel says: "An [a more] average gives us no assurance that the future will be like the past. The chance of an accurate guess is on the track of this inquiry: if those members of a species whose size or other measurable attributes are above (or below) the average are preferred—by "natural" or some other kind of selection—as giving the best knowledge of the quasimenu, and that the frequency as regards that attribute be modified in the next generation.

125. A particularly perfect application of the normal law of error is one more than one dimension is afforded by the movements of the spheroids in a horizontal space. The weight of the role played by probabilities in the explanation of these movements may be obtained without entering into the more complicated and controverted parts of the subject, without going beyond the initial very simple and abstract supposition of perfectly elastic equal spheres. For convenience of enunciation we may confine ourselves to two dimensions. Let us imagine, then, an enormous billiard-table with perfectly elastic cushions and a frictionless surface on which millions of perfectly elastic balls rush hither and thither at random, colliding with each other—a homogeneous chaos, with that sort of uniformity in the midst of diversity which is characteristic of probabilities. The hypothesis is here that a number of collisions on any s balls taken at random—they need not be, according to some they ought not to be, contiguous—if s is very large, the average properties will be approximately the same as those of the total mixture. In particular the average energy of the s balls may be equated to the average energy of the N/N-s balls. Thus the average energy of a single ball, being equal to N the total number of the balls. Now if we watch any one of the n specimen balls long enough for it to undergo a great number of collisions, we observe that either of its velocity-directions, say in the direction x, viz. s, receives accessions from an infinite number of independent causes in random fashion. We may presume, therefore, that these will be distributed (among the n balls) according to the law of error. The law will not be of the type which was first supposed where the "spread" continually increases as the number of the elements is increased. Nor will it be of the type which was afterwards mentioned where the spread diminishes as the number of the elements is increased. The linear function by which the elements are multiplied is the characteristic quantity such that the mean square of deviation corresponding to the velocity remains constant. The method of composition might be illustrated by the process of taking r digits at random from mathematical tables adding the squares of the differences between the real and the mean square of digits, and dividing the sum by \(\sqrt{r}\). Here are some figures obtained by taking at random batches of sixteen digits from the expansion of number, subtracting \(16 \times 4\) from the sum of each batch, and dividing the remainder by \(\sqrt{16}\).
PROBABILITY

Laws of Error

+1.25, +0.75, -1, -1, +5.5, -2.75, +0.75, -2, +1.75, +3.25, +0.25, -2.75, -2.5, -0.5, +4.75, +0.25.

If, instead of sixteen, a million digits went to each batch, the general character of the series would be much the same; the aggregate figures would continue to hover about zero with a standard deviation of 2.5, but the proportion of probable error of observation as the normal law indicates would be much reduced. The other aggregates formed by recombining 252 out of the 256 digits above utilized into batches of 36 according to the prescribed rule: viz. subtracting $36 \times 0.5$ from the sum of each batch of 36 and dividing the remainder by 36.

$-0.5, +3.3, +2.6, -0.6, +1.5, -2, +1.5$.

The illustration brings into view the circumstance that though the system of molecules may start with a distribution of velocities other than the normal, yet by repeated collisions the normal distribution will be superinduced. If both the velocities $u$ and $v$ are distributed according to the normal law, the velocity $w$ for one of these molecules may be the joint values of $u$ and $v$ conform to the normal surface. Or we may reason directly that as the pair of velocities $u$ and $v$ is made up of a great number of elementary pairs (the co-ordinates in each of which need not, initially at least, be independent) this law of frequency for concurrent values of $u$ and $v$ must be of the normal form which may be written

$$z = \frac{1}{\sqrt{2\pi \sigma^2}} \exp\left[-\frac{(x-\mu)^2}{2\sigma^2}\right].$$

It may be presumed that $r$, the coefficient of correlation, is zero, for, owing to the symmetry of the influences by which the molecular chaos is brought about, it is not to be supposed that there is any correlation whatever between the components of the forces, so that the joint values of $u$ and $v$ conform to the normal surface. Or we may reason directly that as the pair of velocities $u$ and $v$ is made up of a great number of elementary pairs (the co-ordinates in each of which need not, initially at least, be independent) this law of frequency for concurrent values of $u$ and $v$ must be of the normal form which may be written

$$z = \frac{1}{\sqrt{2\pi \sigma^2}} \exp\left[-\frac{(x-\mu)^2}{2\sigma^2}\right].$$

It is well to note that for the case of two normal variables of the same distribution, the correlation coefficient is zero. For if the two variables are normal, the correlation coefficient is zero.

1. Above, par. 114, and below, par. 272.
2. Some plurality of independent causes is presumable.
3. Herschel's a priori proposition concerning the law of error in two dimensions might well be defended either as true, or so many phenomena showing no trace of interdependence, or on the principle which justifies our putting $r$ for a probability that is unknown (above, par. 6), or $p$ for a decimal that is neglected; correlation being equally likely to be positive or negative. The latter sort of explanation may be offered for the less contrast between the a priori and the empirical proof of the law of error in one dimension (below, par. 158).
4. Cf. above, par. 115.
of an exploding shell so far as to know the distance of each marked measure (from an origin) along a right line, say the line of an extended fortification, and it was known that the shell was fired perpendicular to the fortification from a distant ridge parallel to the fortification. Then the shell was a kind of which the fragments are scattered according to a normal law \(^1\) with a known coefficient of dispersion; the question is at what position on the distant ridge was the enemy's gun probably placed? By received principles the probability that the result of observations should have resulted from measuring (or aiming at) an object of which the real position was between \(x\) and \(x + \Delta x\) is

\[
\Delta x \cdot \exp \left( \frac{-(x-x_0)^2}{2\sigma^2} \right) dx
\]

where \(\Delta x\) is a constant obtained by equating to unity \(\int_{-\infty}^{\infty} \exp \left( \frac{-(x-x_0)^2}{2\sigma^2} \right) dx\)

(since the given set of observations must have resulted from some position on the axis of \(x\)). The value of \(x\), from which the given set of observations most probably resulted, is obtained by making \(P\) a maximum. Putting \(\frac{dP}{dx} = 0\), we have for the maximum (of \(P\))—and that it is the value of \(x\) which is more negative for this value—the arithmetic mean of the given observations. The accuracy of the determination is measured by a probability-curve with modulus \(\sqrt{n}/n\). This in the course of a very long siege if every case in which the given group of shell-marks \(x_1, x_2, \ldots, x_n\), supposed to represent could be investigated, \(x\) was found that the enemy's cannon was fired from the position \(x^*\) (the point right opposite to the) arithmetic mean of \(x_1, x_2, \&c., x_n\), with a frequency assigned by the equation

\[
\frac{1}{\sqrt{2\pi}} \exp \left( \frac{-(x-x^*)^2}{2\sigma^2} \right)
\]

The reasoning is applicable without material modification to the case in which the data and the quasium are not absolute quantities, but proportions; for instance, if the percentage of white balls in several large batches drawn at random from an immense urn containing red and white balls. Then the case of the shells in the fortification—true inverse problem associated with the name of Bayes.

131. Simple as this solution is, it is not the one which has most recommended itself to Laplace. He envisages the quasium not so simple much as the distribution in the urn—the inverse problem associated with the name of Bayes. The solution, most probably the case which may most advantageously be put for the real one. In our illustration it is as if it were required to discover from a number of shot-marks not the point 2 which in the course of a long siege was fired from, but the point at which the enemy has scattered the observed fragments but the point which it would be best to treat as that position—to fire at, say, with a view of silencing the enemy's gun—having regard not so much to the frequency in the given set of shot-marks as to the point to which it is wrong in the long run. As the measure of the detrimen of error, Laplace 3 takes "la valeur moyenne de l'erreur à craindre," the mean first power of the errors taken positively on each side. The rule discovered by Gauss is the same, and has been found by Gauss as the criterion. 4 Any mean power indeed, the integral of any function which increases in absolute magnitude with the increase of its variable, taken as the measure of the detrimen, will lead to a solution of the inverse problem in a natural way.

132. Yet another speculative difficulty occurs in the simplest, and recurs in the more complicated inverse problem. In putting \(P\) as the probability, deduced from the observations that the real point for which the observations were made was \(x\), and assumed that prior to observation one value of \(x\) is as probable as another. In our illustration it must be assumed that the enemy's gun was as likely to be at one point as another (of a certain tract) of the ridge from which it was fired. If, apart from the evidence of the shell-marks, there was any reason for thinking that the gun was situated at one point rather than another, the formula would require to be modified. This a priori probability is sometimes grounded on our ignorance; according to another view, the procedure is justified by a rough general knowledge that over a tract of \(x\) for which \(P\) is sensible one value of \(x\) occurs about as often as another. 5

\[1\] If normally in any direction indirectly according to the two- or three-dimensional case of error, namely, when collected and distributed in belts perpendicular to a given straight line, as in the example cited below, par. 155.

\[2\] Or small interval (cf. preceding section).

\[3\] Moreover, a positive error must be considered est un désavantage ou une perte réelle à un jeu quelconque."

\[4\] Théorie analytique, art. 20 seq., especially art. 25. As to which it is acutely remarked by Bravais (op. cit. p. 258). "Cette règle simple laisse à désirer une démonstration rigoureuse, car l'analytique doit être considéré, si le terme ne se trouve pas dans le jeu, comme une preuve de la manipulation de l'erreur, et on y est arrivé par une méthode qui n'est pas proportionnée to the square of its magnitude” (American Journal of Mathematics; vol. viii. No. 4).

\[5\] As argued by the present writer, Camb. Phil. Trans. (1885), vol. xiv. pt. ii. b. 161. Cf. Glashier, Mem. Astronom. Soc. (1898), p. 32; Theory combinations, pt. i. § 6. Simon Newcomb is conspicuous in walking in the way of Laplace and Gauss in his preference of the most advantageous to the most probable determinations. With regard to this, the statement is made that "the evil it involves is to be proportioned to the square of its magnitude" (Mind, p. 180; approved by Professor Pearson, Grammar of Science, 2nd ed. p. 156).

\[6\] The view taken by the present writer on the "Philosophy of Chance," in Mind (1880); approved by Professor Pearson, Grammar of Science, 2nd ed. p. 156.

\[7\] The standard deviation pertaining to a set of \(n\) observations, each derived from the original \(n\) observations by averaging a batch thereof numbering \(n\), is \(\sqrt{\frac{1}{n^2}(n^2-n)} = \sqrt{n}/n\), when the given observations are all of the same weight; mutatis mutandis when the weights differ.
The text seems to be a continuation of the discussion on probability and error calculation. It mentions various methods and concepts, such as the mean square deviation, the arithmetic mean of a sample, and the determination of the modal age at death. It also discusses the use of Sheppard’s corrections and the method of errors in a selected part of the population. The text is a part of a larger discussion on statistical methods and their applications.
154. The solution proper to the case where the observations are known to follow a distribution as that of the normal law may be extended to numerous observations ranging under any law, on the principles which justify the use of the Method of Least Squares in the case of a single quasaeuism.

155. As in that simple case, the principle of economy will now justify the use of the median, e.g. in the case of two quasaeusia, putting for the value of the perpendicular on x and that on y the half-sum of the perpendiculars let fall from it on each of a set of lines representing the given equations (properly weighted) is a minimum.3

156. The older writers have expressed the error in the determination of one variable as that of the other. But the error of one variable may be regarded as correlated with that of the other; that is, if the system

\[ x' + y' \equiv \ldots \equiv \text{the red, } x' \equiv \text{the green, } x' \equiv \ldots \] which will concur in the long run of systems from which the given set of observations result are normally correlated. From this point of view Bravais, in 1846, was led to several theorems which may all be referred to a single total equation, to which the analogous solutions are given (not in general small deviations) from the means of two or more correlated members (or organs or attributes) forming a normal group.

157. To determine the frequency-constants of such a group it is proper to proceed on the analogy of the simple case of one-dimensional error.

In the case of two dimensions, for instance, the probability \( p_1 \) that a given pair of observations \((x, y)\) should have resulted from a normal group of which the means are \( \bar{x} \) and \( \bar{y} \), respectively, the standard deviations \( \sigma_x \) and \( \sigma_y \) and the coefficient of correlation \( r \), may be written

\[ \Delta x \Delta y = \Delta x \sigma_x \Delta y \sigma_y \exp(-r^2) \]

where \( r \) is the coefficient of correlation between \( x \) and \( y \), and \( \sigma_x \) and \( \sigma_y \) are the standard deviations of \( x \) and \( y \), respectively. A similar relation holds for the other pairs of observations \((x_2, y_2), (x_3, y_3), \ldots \); with analogous expressions for \( p_2, p_3, \ldots \).

Whence, as in the simpler case, we have

\[ p_1 \times p_2 \times \ldots \times p_n \]

(a constant) for \( p \), the posterior probability that the given observations should have resulted from an assigned group, i.e. for the frequencies, and \( \exp(-r^2) \) for the possible cases of the same total frequency.

The most probable system is determined by making \( p \) a maximum, and accordingly equating to zero each of the following expressions:

\[ \frac{\partial p}{\partial x} = 0, \frac{\partial p}{\partial y} = 0 \]

The values of the arithmetic mean and of the standard deviation for each variable are what have been obtained in the simple case of one dimension. The value of \( r \) is the coefficient of correlation between the variables, and it is to be remembered that the errors to which it is liable are small.4 Such coefficients have already been calculated for a great number of interesting cases. For instance, the coefficient of correlation between the human stature and the weight at the age of five years is 0.96; between the statures of husbands and wives is 0.28.5

158. This application of inverse probability to determine correlation-coefficients and the error to which the determination is liable have been largely exploited by Professor Pearson, and other recent writers. The theory of the normal formula to measure the probable—improbable—errors incident to such determinations is justified by reasoning akin to that which has been employed in the general proposition of the law of propagation of error. Professor Pearson has pointed out a circumstance which seems to be of great importance in the theory of evolution: that the errors incident to the determination of different frequency-coefficients are apt to be mutually correlated. Thus if a random selection be made from a certain population, such a set of coefficients may not be likely to differ from the coefficient proper to the complete group in the same sense as some other frequency-coefficients.

159. The last remark applies also to the determination of the coefficient of correlation, by abridged methods, on principles explained with reference to the simple case; for instance by the formula \( r = \frac{\Sigma xy}{\Sigma x^2} \). This formula is the sum of (some or all the positive (or the negative) deviations of the values for one organ or attribute measured by the modulus pertaining to that member, and \( \Sigma y \) is the sum of the values of the other member, which are associated with the constituents of \( x \). This variety of this method is certainly much less accurate than the method prescribed by genuine inversion.

160. A method of rejecting data analogous to the use of percentiles in one dimension is practised when, given the frequency of observation \( z^2 \) the fraction \( \theta^2 \) that is greater than \( z^2 \), which is of interest only for the frequency for integral areas. Mr Sheppard has given an elegant solution of the problem: to find the correlation between two attributes, given the medians \( L \) and \( M \), of a normal group for each attribute and the distribution of the total group, as thus.

\[ \begin{align*}
\text{Below } L, & \quad \text{P} & \quad \text{Above } L, \\
\text{Above } M, & \quad r & \quad \text{P} & \quad \text{R} \\
\text{Below } M, & \quad r & \quad \text{P} & \quad \text{R}
\end{align*} \]

If \( \cos D \) is put for \( r \), the coefficient of correlation, it is found that \( D = \sqrt{(P+R)} \). For example, let the group of statistics relating to dice already cited from Professor Weldon be arranged in four quadrants by a horizontal and a vertical line, each of which is divided into a number of equal divisions. The equations prove to be respectively \( y = 611 \) and \( x = 616 \). For \( R \) we have 1360, and for \( P \) 687.5 roughly. Whence \( D = x \cos 66 = \frac{1}{2} \) nearly, as it ought; the negative sign being understood. In the circumscription of the lower part of Mr Sheppard's diagram in fig. 12 corresponds to the upper part of Professor Weldon's diagram shown in par. 115.

161. Necessity rather than convenience is sometimes the motive for the use of such correlations. Pearson has applied the median method to determine the correlation between the husbands and wives in respect of the darkness of eye-colour, a character which does not admit of exact graduation: "our numbers merely refer to certain groupings, arranged, it is true, in increasing darkness of colour, but are not related by a law of correspondence between husband and wife..." From data of this sort, having ascertained the number of husbands with eye-colours above the median tint who marry wives with eye-colour above the median tint, Professor Pearson finds for the correlation-coefficient \( r \). A general method for determining the frequency-constants when the data are, or are taken to be, of the integral kind has been given by Professor Pearson. Attention should also be called to Mr Yule's treatment of the problem by a sort of logical calculus on the lines of Boole and Jevons.

162. In the cases of correlation which have been so far considered, it has been presupposed that the things correlated range according to the normal law of error. But now, suppose the law is no longer that of a normal distribution, but, for instance, that the dots on the plane of \( xy \), representing each a pair of members, are no longer grouped in elliptic (or circular) rings of equal frequency, that the locus of the maximum deviation is represented by a straight line or a right angle line. How is the interdependence of these deviations to be formulated? It is submitted that such data may be treated as if they were normal: by an extension of the Method of Least Squares, in two or more dimensions.14 Thus when the amount of pauperism together with the amount of outdoor relief is plotted in several unions there is obtained a distribution far from normal. Nevertheless if the average pauperism and average outdoor relief are taken for say five quinquets or decades—of unions taken at random, it may be expected that these means will conform to the normal law, with coefficients obtained from the original data, according to the rule which is proper to the case of the normal law.15 By obtaining averages conforming to the normal law, as by the simple application of the method of least squares, we should not indeed have utilized the whole of our data, but we shall put a part of it in a very useful

2 Above, par. 115.
5 Above, par. 127.
6 Above, par. 176.
7 If from the given set of \( n \) observations (each corresponding to a point on the plane \( xy \)) there is derived a set of \( n^2 \) observations each obtained by averaging a batch numbering \( n \) of the original observations; the coefficient of correlation for the derived system is the same as that which pertains to the original system. As to the standard deviation for the new system see note to par. 135.
shape. Although the regression-equations obtained would not actually fit the original material, yet they would have a certain correspondence thereto. What sort of correspondence, may be illustrated by an example in games of chance, which Professor Weldon kindly supplied. The following six of dice having been thrown, the number of dice with more than three points in that dozen which is made up of the first and the second half-dozen is taken for $x$. Thus each two-coin observation $(x y)$ is the sum of six twofold elements, each of which is subject to a law of frequency represented in fig. 13; where $y$ the figures outside denote the number of successes of each kind, for the ordinate the number of dice with more than three points (out of a cast of two dice), for the co-ordinate the number of sixes (out of a cast of two dice), one of which is common to the aforesaid cast; and the figures inside denote the comparative probabilities of each twofold value (e.g. the probability of obtaining in the first two cast dice each with more than three points, and in the second case, the same). Treating this law of frequency according to the rule which is proper to the normal law we have for (the element) if the sides of the compartments $c = 1,2,3,4,5,6$. Accordingly, in Professor Weldon's statistics, which are reproduced in the annexed diagram, when $x = 3$ the

most probable value of $y$ ought to be 1. And in fact this expectation is verified, $x$ and $y$ being measured along lines drawn through the centre of the compartment, which ought to have the maximum content, the regression of the concurrence of one pair with two squares and another pair with three squares being also the first power of one of the compartments which in fact contains 254 (almost the maximum content). In the absence of observations at $x = 3$ or $y = 6$, the regression-equations cannot be verified. At least they have been verified to a certain extent by the law of numbers, whereas they are not verifiable at all for the simple elements. The normal formula describes the given statistics as they behave, not when by themselves, but when massed in crowds: the regression-equation does not tell us the maximum magnitude of the other member associated therewith, but that if $x$ is the amount of several samples of the first member, then $x$ is the most probable average for the specimens of the other member associated with those samples. Mr Yule's proposal to construct regressions according to the normal rule, without troubling to investigate the normality of the distribution, admits of this among other explanations. Dr Yule's own view of the subject is well worthy of attention.

---

These values were substituted for the coefficients in the general formula, there results an expression which may be obtained directly by continuing to expand the expression for a term of the binomial.

In virtue of the second approximation a set of observations is not to be excluded from the capacity to the normal curve because the curve of barometric heights, it is slightly asymmetrical. In virtue of the third approximation it is not excluded because like the group of shot-marks above examined, it is, though almost perfectly symmetrical, in other respects apparently somewhat abnormal.

160. If the third approximation is not satisfactory there is still available a fourth, or a still higher degree of approximation. The normal expression for which an approximation by the normal curve and for which an approximation of the error-function

\[ e^{-\frac{1}{2}(\frac{d}{\sigma^2})^2} \]

\[ = \frac{1}{\sqrt{2\pi}} \exp \left( -\frac{1}{2}(x-\mu)^2 \right) \]

is the mean square of deviation; \( k_1, k_2, \ldots, \kappa_\infty \), are coefficients formed from the power \( x_k \) by which amplified by \( \beta_k \) the difference between the \( k \)th mean power as it actually is and what it would be if the \( (r-1) \)th approximation were perfectly correct. Thus \( k_1 \) is the difference between the actual mean third power and what the normal curve would predict if the \( (1-1) \)th approximation were perfectly correct, that is, the difference between the actual mean third power, often written \( \mu_k \) and zero, that is \( \mu_k \). Similarly \( k_2 \) is the difference between the actual mean fourth power of deviation, see \( \mu_k \), and what that mean power would be if the second approximation were perfectly correct, viz. \( \mu_k \). Thus \( k_3 = \mu_k - \mu_3 \).

The series \( k_1, k_2, k_3, \ldots, \kappa_\infty \), form each a succession of terms descending in the order of magnitude, when each \( k \), e.g. \( k_1 \), has been divided by the corresponding power, i.e. the power of \( \alpha \) of the parameter or modulus \( e^x = (2k) \), which division is secured by the successive differentiations of \( \gamma \), with which each \( k \) is associated, e.g. \( k_1 \) with \( (\frac{d}{dx})^1 \).

Moreover, the first term of the odd series of \( k \)'s when divided by the proper power of the parameter, viz. \( \epsilon^p \) is small in comparison with the first term of the even series, viz. \( k \), properly referred — divided by \( \epsilon^q \) (= \( \frac{k_1}{\epsilon^p} \)).

The second degree of approximation employed, it is to be remembered that the law in general is only applicable to a certain range of the compound magnitude here represented by the abscissa \( x \).

The curve of error, even when generalised to the present, coincides only with the rule that \( x_k \) may be the deviation, and not the body, as distinguished from the extremities of the actual locus; a greater or less proportion.

162. The law thus generalised may be extended, with similar reservations, to two or more dimensions. For example, the second approximation in two dimensions may be written

\[ z = \frac{1}{\pi(1-\pi^2)} \exp \left( -\frac{x^2-2xy+y^2}{(1-r^2)} \right) \]

\[ = \frac{1}{\pi(1-r^2)} \exp \left( -\frac{1}{2}\left( \frac{x-\mu_k}{\sigma_k} \right)^2 \right) \]

\[ = \frac{1}{\pi(1-r^2)} \exp \left( -\frac{1}{2}\left( \frac{x-\mu_k}{\sigma_k} \right)^2 \right) \]

where \( x \) and \( y \) are (as before) co-ordinates measured from the centre of gravity of the group as origin, each referred to (divided by) its proper modulus; \( \mu_k \) is the ordinary coefficient of regression; \( \sigma_k \) is the mean square of the rule for the \( k \)-th element; \( x \) and \( y \) are so related; on all these \( k \)'s being quantities of an order less than unity. This form lends itself readily to the determination of a second approximation to the regression-curve, which is the locus of that \( y \), which is the most probable value of the ordinate corresponding to an assigned value of \( x \). Form the logarithm of the above-written expression (for the frequency-surface) and differentiate that logarithm with respect to \( x \). The required locus is given by the + 16t.

Whatever the degree of approximation, the true moments from the complete set of observations if homogeneous, according as the system of elements fulfils more or less perfectly certain conditions.
of the two (the second differing being always negative). The resulting equation is of the form
\[ y = \frac{1}{x} - x - ax^2 - 2bxy - y^2 = q, \]
where \( \Phi, a, \beta, \gamma \) are all small, linear functions of the \( k \)'s. As \( y \) is nearly equal to \( x \), it is legitimate to substitute \( x \) for \( y \), when \( y \) is multiplied by a small coefficient. The curve of regression thus reduces to a parabola with the equation of form
\[ y = \frac{1}{x} - ax - qx^2, \]
where \( q \) is a linear function of the third mean powers and moments of the given group.

163. Dissection of certain Heterogeneous Groups.—Under the head of law of error may be placed the case in which statistics relating to two (or more) different types, each separately conforming to the normal law, are mixed together; for instance, the measurements of human heights in a country comprising two distinct races.

In this case the quasella are the constants in a curve of the form:
\[ y = a \left( 1 / \sqrt{2} \right) \exp \left( - \left( x - a \right)^2 c^2 / \left( 1 / \sqrt{2} \right) \right) \exp \left( - \left( x - b \right)^2 c^2 / \left( 1 / \sqrt{2} \right) \right), \]
where \( a \) and \( b \) are the respective sizes of the two groups \( (a + b = 1); a \) and \( c \) are the respective centres of gravity; and \( c_1, c_2 \) the respective moduli. The data are measurements each of which relates to one or other of these component curves. A solution of this difficult problem has been given by Professor Pearson. The five unknown quantities are connected by him with the centre of gravity of the given observations, and the mean second, third, fourth and fifth powers of their deviations from that centre of gravity, by certain rational algebraic equations, which reduce to an equation in one variable of the ninth dimension. In an example worked by Professor Pearson this fundamental equation had three possible roots, none of which gave very fair solutions of the problem. While the third suggested that there might be a negative solution, importing that the given system would be obtained by subtracting one of the normal groups from the other; but the coefficients for the negative solution proved to be imaginary. In the case of crabs' foreheads, therefore, we do not represent the frequency curve for their forehead characters by a single normal curve, but by a combination of two of these normal curves. In another case, which prima facie seemed normal, Professor Pearson found that all nine roots of the fundamental nonic lead to imaginary solutions of the problem. The process of separation of the normal curves is analogous to the method of separation of the central groups in the earlier method of the two-normal probability curve. The ground and scope of the new law will not be better stated than in the words of the author: "The slope of the normal curve is given by a relation of the form \[ 1 dy = \frac{1}{x} - x - ax - qx^2. \]
The slope of the curve correlated to the skew normal, as the normal curve to the symmetrical binomial, is given by a relation of the form
\[ 1 dy = \frac{1}{x} - x - ax + c_1 x^2. \]
Finally, the slope of the curve correlated to the hypergeometrical series (which expresses a probability distribution in which the component groups are not entirely mixed but equally likely to give equal deviations in excess and defect), as the above curves to their respective binomials, is given by a relation of the form
\[ 1 dy = \frac{1}{x} - x - ax + c_1 x^2. \]

This latter curve comprises the two others as special cases, and, so far as my investigations have yet gone, practically covers all homogeneous statistics that I have had to deal with. Something still more general may be conceivable, but I have found no necessity for it."

The "hypergeometrical series" it should be explained, had appeared as representative of the distribution of black balls in the following case. "Take a ball in a bag, of which \( p \) are black and \( q \) are white, and let \( r \) balls be drawn and the number of black be recorded. If \( r > s \), the number of black balls will lie between \( p \) and \( p n \); the resulting frequency-polygon is given by a hypergeometrical series."

Further reasons in favour of the construction is given by Professor Pearson in a later paper. "The immense majority, if not the totality, of frequency distributions in homogeneous material show, when the frequency is indefinitely increased, a tendency to give a smooth curve characterized by the following properties. (a) The frequency starts from zero, increases slowly or rapidly to a maximum and then falls again to zero—probably at a quite different rate—as the character for which the frequency is measured is steadily increased. This is the almost universal unimodal distribution of the frequency of homogeneous series. (b) In the place next there is generally contact of the frequency-curve at the extremities of the range. These characteristics at once suggest the following of frequency curve, if \( y \) measure the frequency falling between \( x \) and \( x + h \):
\[ dy = y(x + a) f(x). \]
Now let us assume that \( F(x) \) can be expanded by Maclaurin's theorem. Then our differential equation to the frequency will be
\[ \frac{dy}{dx} = \frac{y(x + a)}{F(x)}. \]
Experience shows that the form \( x \) ("keeping \( b, b_1, b_1 \) only") suffices for certainly the great bulk of frequency distributions."

The "generalized probability-curve" presents two main forms:
\[ y = y_0(x + a_1) f_0(x), \]
and
\[ y = y_1(x + a_1) f_1(x). \]
When \( a_1, a_2, \alpha \) are all finite and positive, the first form represents, in general, a skew curve, with limited range in both directions; in the particular case, when \( a_1 = a_2 = a \), a symmetrical curve, with range limited in both directions. If \( a_1 = a_2 = 0 \), the curve reduces to
\[ y = y_2(x + a_1) f_2(x). \]
representing an asymmetrical binomial with \( y_2 = 2\mu_2a_1 \), and
\[ y = y_3(x + a_1) f_3(x). \]
When \( a, a_2, \alpha \), and \( a_1 \) are all finite and positive, the second form reduces to
\[ y = y_4(x + a_1) f_4(x). \]

Section II.—Laws of Frequency.

165. A formula much more comprehensive than the corrected normal law is proposed by Professor Pearson under the designation of the "generalized probability-curve." The ground and scope of the new law will not be better stated than in the words of the author: "The slope of the normal curve is given by a relation of the form
\[ 1 dy = \frac{1}{x} - x - ax + c_1 x^2. \]
The slope of the curve correlated to the skew normal, as the normal curve to the symmetrical binomial, is given by a relation of the form
\[ 1 dy = \frac{1}{x} - x - ax + c_1 x^2. \]
Finally, the slope of the curve correlated to the hypergeometrical series (which expresses a probability distribution in which the component groups are not entirely mixed but equally likely to give equal deviations in excess and defect), as the above curves to their respective binomials, is given by a relation of the form
\[ 1 dy = \frac{1}{x} - x - ax + c_1 x^2. \]

167. Skew Correlation.—Professor Pearson has extended his

Fig. 14.

FIG. 14.

Fig. 15.
method to frequency-loci of two dimensions, constructing for the curve of regression (as a substitute for the normal right line), the case of "skew correlation," a paraabol,[2] with constants based on the higher moments of the given group.

In this connexion reference may again be made to Mr Yule's method of treating skew surfaces as if they were normal. It is certainly remarkable that the correlation should be so well represented by a line—the property of a normal surface—in cases of which normality cannot be predicated: for instance, the statistics of the numbers of husbands (or wives) living at each age who have wives (or husbands) living at different ages. It may be suggested that though in this case there is one dominant cause, the continual decrease of the population, inconsistent with the plurality of causes postulated for the law of error, yet there is a sufficient degree of accidental variation to realize one property at least of the normal locus.

§ 109. There is possibly an extensive class of phenomena of which frequency depends largely on fortuitous causes, yet not so completely as to present the genuine law of error.

**Relations between Frequency and Probability.**

This mixed class of phenomena might be amenable to a kind of law of frequency that would be different from, yet have some affinity to, the law of error.

The double character may be taken as the definition of the laws proper to the present section. The definition of the class is more distinct than its extent. Consider for example the statistics which represent the numbers out of a million born that die in each year of age after thirty of the latter part of the column in a life-table. These are well represented by a species of Professor Pearson's "generalized probability-curve," its type iii. of the form

$$y = \frac{(1 + x)^2}{2} e^{-\lambda x^2}$$

The statistics also lend themselves to the Gompertz-Makeham formula for the number living at the age

$$I = S + g^2 T$$

The former law, the simplest species of the "generalised probability-curve," may well be attributed in part to the operation of a plexus of causes such as that which is apt to generate the law of error. In fact, a high authority, Professor Lexis, has seen in these statistics—or continental statistics in part materia—a fulfilment of the normal law of error. They at least fulfill tolerably the generalized law of error above described. But the Gompertz-Makeham formula is not thus to be accounted for; and yet thus that it was regarded by its discoverers. Gompertz justifies his law[7] by a "hypothetical deduction congruous with many natural effects," such as the exhaustion of air by a pump; and Makeham follows[8] in the same track of explanation by way of natural laws. Of course it is not denied that mortality is subject to accident. But the Gompertz-Makeham law purports to be fulfilled in spite of, not by reason of, fortuitous agencies. The formula is accounted for not by the interaction of fleeting causes which is characteristic of probability, but by causes of that ordinary kind of which the investigation constitutes the greater part of natural science. Laws of frequency thus conceived do not belong to the theory of Probabilities.

**Authorities.**—As a comprehensive and mastery treatment of the subject as a whole, in its philosophical as well as mathematical character, there is nothing similar or second to Laplace's *Théorie analytique des probabilités*. But this "ne plus ultra of mathematical skill and power as it is called by Herschel (Edinburgh Review, 1857), is not easy reading. Much of its difficulty is connected with the use of a mathematical method which is now almost superseded,

---

2 Not the same parabol as that proposed at par. 162.

The "Generating Functions." Not all parts of the book are as rewarding as the Introduction (published separately as *Essai philosophique des probabilities*) and the fourth and subsequent chapters of the second edition. Among numerous examples, Czuber's *Mathematische Wahrscheinlichkeitslehre* (1890) may be noticed as terse, lucid and abounding in references. Other authorities may be mentioned in relation to the different parts of the subject as above divided. First principles are discussed with reference to Laplace's *Philosophie de la Probabilité* (1814), by J. v. Kries in *Principien der Wahrscheinlichkeitsrechnung* (1866). As a repertory of neat problems involving the calculation of probability and expectation V. A. Whitworth's *Choice and Chance* (1874) in its second edition. Various earlier books also described by H. Poincaré's *Calcul des probabilités* (lèons professées 1893-1894). On local or geometrical probability Professor Morgan Crofton is one of the highest authorities. His paper on "Local Probability," in *Phil. Trans.* (1883), "Essai géométriques," *Proc. Lond. Math. Soc.* (1887), vii., should be read in connexion with the section on "Local Probability" in his article on "Probability" in the 9th edition of the *Encyclopedia Britannica*, from which several paragraphs have been transferred en bloc to the section on Geometrical Applications in the present article. The topic is treated exhaustively by Czuber in *Geometrische Wahrscheinlichkeiten und Minimisprinzipien* (1884). The author is also the author of the *Theorie der Befschaffungsfelde*, in which he has produced, often with improvement, or referred to, almost everything of importance in the work of his predecessors. A. L. Bowley's *Elements of Statistics*, p. 2 (2nd ed., 1902), forms an introduction to the law of error which may be of interest to some of the present readers. References to other works are given in Section I of Part II. A list of writings on the cognate topic, the method of least squares, has been given by Merriman (Connecticut Trans. iv.). On laws of frequency, as above defined, Professor E. S. Pearson, Karl Pearson, is the highest authority. His "From the Mathematical Theory of Evolution," of which twelve have appeared in the Trans. Roy. Soc. (1894-1905) and others are being published by the Drapers' Company, team with numerous treatises in *Probabilities,* (F. Y. E. P.)

**PROBATE,** in English law, the "proving" (Lat. *probatio*) of a will. The early jurisdiction of the English ecclesiastical courts over the probate of wills of personality is discussed under WILL. The Court of Probate Act 1857 transferred the jurisdiction both voluntary and contentious of all ecclesiastical, royal peculiar, peculiar and manorial courts to the court of probate thereby constituted, created a judge and registrars of that court, abolished the old exclusive rights in testamentary matters of the advocates of Doctors' Commons, and laid down rules of procedure. Contentious jurisdiction was given to county courts when the personal estate of the deceased was under £2000 and the Court of Probate divorce and admiralty division of the High Court of Justice. The division now consists of the president and one other judge. The practice of the division is mainly regulated by the rules of the Supreme Court 1883. Appeals lie to the court of appeal and thence to the House of Lords. Probate may be taken out either in *common* or *sealmen* form. In the former case, which is adopted when there is no dispute as to the validity of the will, the court simply recognizes the will propounded as the last will of the deceased. This formality is necessary to enable the executor to administer the estate of his testator. Probate in this form is granted simply as a ministerial act if the attorney in the will or the attorney in the will or the will has been contractually agreed, or if other evidence is necessary to that effect. This form may be renewed for six months and the will may be renewed each six months. The executor may however take out a summons to get the caveat "subducted" or withdrawn, but if an appearance to the summons is entered...
within six days to the summons the executor is then compelled to prove in solemn form. Probate in solemn form is a judgment of the court in favour of the will propounded, and is only revocable by the discovery of a later will. In order, therefore, to obtain such grant proceedings have to be taken by action, and witnesses produced in support of the will, and the action proceeds in the usual way.

The principal rules now obtaining as to probate are these. Probate, which since the Land Transfer Act 1897 must be taken out for wills of realty as well as wills of personality, may be granted either in the principal or in a district registry, and should be obtained within six months after the testator's death. When no executor is named the will is not now invalid, as was once the case, but administration cum testamento annexo is granted. The same course is pursued where the executor renounces or disclaims the estate before the administrator of the deceased.

After probate, the probate itself (as the official copy of the will is called) becomes evidence, the original will being deposited in the principal registry at Somerset House, London. On grant of probate, estate duty, denoted by a stamp on the affidavit sworn for that purpose, is payable. It varies according to the amount at which the estate of the deceased is fixed by the oath of the executor (see Estate Duty). The act of 1881 enables any officer of inland revenue to grant probate where the personal estate does not exceed £300.

Ireland.—In 1867 an act on lines similar to the English act was passed for Ireland and under the Irish Judicature Act of 1877 the then existing court of probate was merged in the High Court of Justice.

Scotland.—Confirmation includes both the probate and letters of administration of English procedure. Without confirmation by the court interference by the executor becomes a vitiating introduction of the will of movables not as in England, under the cognizance of the church courts. Such jurisdiction certainly existed at the time of regiam majestatem. This ecclesiastical right continued through the commissary court at Edinburgh and is confirmed by Queen Mary in 1553. The appointment of commissaries, until modern times when the jurisdiction of the courts was at first transferred and then abolished by a series of enactments from the Commissary Courts Act 1823 to the Sheriff Courts Act 1876. The act of 1823 placed the commissary jurisdiction in the sheriff courts; by the act of 1876 the sheriffs sit as sheriffs in testamentary matters, no longer as commissaries. Confirmation of wills where the whole estate is under £300 is regulated by the Custom of Inland Revenue Act 1891 and other acts. An elik is an addition to a confirmation made on discovery of additional effects of the deceased after confirmation.

United States.—Probate is granted in some states by the ordinary chancery or common law courts, but more frequently by courts of special jurisdiction, such as the prorogative court in New Jersey, the surroguates' court in New York, the orphans' court in Pennsylvania.

The majority of the states the original equitable jurisdiction over administrations is in ordinary cases—without any special circumstances such as fraud, or without any other equitable feature such as trust—either expressly or practically abrogated. The courts of equity, in the absence of such special circumstances or distinctively equitable features, either do not possess or will not exercise the jurisdiction, but leave the whole matter of administration to the special probate tribunals; that is to say, that unless the court of equity finds special features or exceptional circumstances of themselves warranting the interference of equity, such as fraud, waste, and the like, or unless it is of such an essential nature that a probate court is incompetent to give adequate relief, it will not exercise its inherent power to compel the persons having the estate to take action, even though the court of equity has had full cognizance of the matter, and becomes more or less desirous of taking cognizance of the same, but must wait until the proper party, that is, the person having the estate, brings the matter before the court or commences suit. The act of 1844 made the register of probate the first person to whom a probate court has to look for evidence, and the courts of equity are thus relieved of much of their work.

Probate courts are in most if not all the states courts of record, having a public seal and a clerk (or the judge has authority to act as clerk); they issue process and execute their decrees by appropriate officers in the same manner as the common law and chancery courts. They sit at stated terms. They have power to punish for contempt, and to compel obedience to their orders and decrees, and their judgments upon matters within their jurisdiction are enforced usually by the same means as common law and chancery courts (Noemen's Law of Administration, § 145).

Jurisdiction as to wills and their probate as such is neither included in nor excepted out of the grant of judicial power to the courts of the United States (i.e. the Federal as distinguished from the state courts). So far as it is ex parte and merely administrative it is not conferred, and it cannot be exercised by them at all until in a case at law or in equity, its exercise becomes necessary to settle a controversy by reason of the (diverse) citizenship of the parties. An action to set aside the probate of a will of real estate may be maintained in a Federal court when the parties on one side are citizens of a different state from the parties on the other side (Ellis v. Davis, 109 U.S. Reports, 483). Probate in solemn form, i.e. after due notice to all parties in interest is the almost universal form in use in the United States. On a petition for a confirmation the grant of a subsequent probate validates the conveyance (1896, Mackey v. Mackey, 63 Atl. Rep. 984).

In Illinois a court of equity has no inherent power to entertain a bill to contest a will (1905; O'Brien v. Bonfield, 220 III. Rep. 219).

In Missouri a foreign (New York) will of real estate in Missouri, probate of which was duly recorded in Missouri, cannot be collaterally attacked, and cannot be set aside by direct proceeding after being filed for record more than five years in Missouri (1907; Cohen v. Herbert, 104 So. W. Rep. 84).

PROBATION. The probation system, in penology, is an attempt to reform a prisoner outside prison, a special kind of warder—the probation officer—supervising the prisoner in the prisoner's own home. The state of Massachusetts in America was the first to attempt "probation," and at first (1878) in a tentative manner. As success crowned the efforts of the reformers the system was developed and applied to an increasing number of cases; and gradually other American states followed with some variations in their plans. The probation officers attend the court and the judge officially gives up the prisoner to the officer chosen to supervise him, generally explaining to him that, if he is not obedient to all the rules made for him by the officer, he will be his fate. An officer generally has from sixty to eighty cases under his care. Women officers are in charge of women and boys and girls under eighteen. A probation officer has a special area of the town allotted to him and usually gets all prisoners from that area. He acquires an intimate knowledge of the physical, economic and social surroundings in which his prisoner lives. He is therefore well fitted to watch him and to help him to become once more a decent citizen. He gradually gives him back his liberty and removes restrictions until he is capable of living a decent life alone. The powers of the probation officer are necessarily very great. The prisoner continues his work as before, but the officer visits his factory or workshop and arranges to receive his wages each week, passing over the greater part of them to the prisoner, and giving him at the end of the month what remains due. The officer may also direct one remittance to the prisoner for personal expenses, and retaining a small sum, which is paid back to the prisoner when he becomes a free man.

The advantages claimed for the probation system are these, that a number of independent well-paid probation officers, chosen for their knowledge of human nature and their skill in reforming it, can give personal attention to individual cases; the stigma of prison is avoided, and while great care is taken that the prisoner shall be strictly controlled and effectively
restrained, his self-respect is carefully developed; the family benefits, the home is not broken up, the wages still come in, and if the prisoner is a mother and a wife, it is, of course, most important that she should retain her place in the home; the prisoner does not "lose his job" nor his mechanical skill if he is a skilled workman. Lastly, the system is far cheaper than imprisonment. The prisoner keeps himself and his family, and one officer can attend to from 60 to 80 prisoners.

In the United Kingdom the probation system has been applied to young offenders by the Prevention of Crime Act 1908. That act empowered the prison commissioners to place offenders on licence from the Borstal Institution (see Juvenile Offenders) at any time after six months (in the case of a female, three months), if satisfied that there was a reasonable probability of their abstaining from crime and leading a useful and industrious life. The condition of their release is that they be placed under the supervision or authority of some society or person (named in the licence) to keep charge of the case. This is, of course, only a limited application of the system of probation, for those retained in a Borstal Institution are offenders between the ages of sixteen and twenty-one who have been convicted of an indictable offence. It does not apply to those of full age, nor to those under twenty-one years of age who have been committed to prison for minor offences. It has been long held by English probation reformers that young persons under the age of twenty-one should not be committed to prison, unless for serious offences, but that they should be put under some system of probation. Legislation to this effect was foreshadowed by the home secretary in his speech on prison reform in the House of Commons on the 26th of July 1910.

PROBOSCIDEA (animals with a proboscis), the scientific name of the group of mammals represented at the present day only by the two species of elephant. Although regarded as a sub-order of Ungulata (q.v.), the group is sometimes accorded the rank of an order by itself. The existing elephants are widely scattered over all the larger living mammals, and for a long time palearctic afforded but little clue as to their ancestry. Discoveries made during the first few years of the 20th century in the Lower tertiary deposits of the Fayum district of Egypt have, however, brought to light the existence of several kinds of primitive proboscideans which serve to link the group with other ungulates, and likewise apparently indicate affinity with the Sirenia.

The following are some of the leading characteristics of existing elephants. The combined upper lips and nose are produced into a long muscular, flexible and prehensile proboscis, or trunk, with the nostrils at its tip. The teeth consist of a pair of large upper permanently growing incisors or tusks; and a set of cheek-teeth, consisting of five pairs, and their crowns composed of a series of tall transverse vertical plates gradually increasing in number from the first to the last of the series; and only portions of two of these teeth being in use at any one time. There are no clavicles; and the limbs are stout, with their component segments placed nearly in a vertical line, and the upper segment, especially in the hind-limb, the longest; the radius and ulna are distinct, the latter articulating extensively with the carpals; the fibula and tibia also distinct; the astragalus very flat on both surfaces; and both front and hind feet short, broad and massive, with five toes (though the outer pair may be more or less rudimentary), all encased in a common integument, though with distinct, broad, short hoofs; third digit the largest. Two anterior value caves entering the right auricle. Stomach simple. A capacious caecum. Testes permanently abdonic. Uterus bicornuate. Placentae deciduate and zonary. Treats two, pectoral.

Dentition. The teeth being the chief instruments of the dentition, it is necessary to discuss them in some detail of the remains of the true elephants, such as the mastodons (see Mastodon). As regards the incisors, or tusks, which project largely out of the mouth, and are of an elongated conical form and generally curved, these are composed mainly of solid dentine, the fine elastic quality and large mass of which renders it invaluable as "ivory" for commerce and the arts. A peculiarity of the dentine of the proboscideans is that it shows, in transverse fractures or sections, fine lines proceeding in the arc of a circle from the centre to the circumference in opposite directions, and forming by their decussations curvilinear lozenges, as in the "engine-turning" of the case of a watch. The enamel-covering in existing species is confined to the extreme apex, and very soon wears off, but in some extinct species it forms persistent longitudinal bands of limited breadth. The tusks have small milk-predecessors, shed at an early age.

As regards the cheek-teeth, these are composed in the mastodons of a variable number of enamel-covered transverse ridges, often divided into inner and outer columns, which may partially alternate, and complicated by smaller additional columns; but in the unworn tooth they stand out freely on the surface of the crown, with deep valleys between (fig. 1, I). In the elephants the ridges are increased in number, and consequently become narrower from before backwards, while they are greatly extended in vertical height. In order to give solidity to what would otherwise be a comb-like tooth, the whole structure is enveloped and united in a large mass of cement, which completely fills the valleys, and gives a general smooth appearance to the unworn tooth; but as the wear consequent upon the masticating process proceeds, the alternate layers of tissue of different structure are separated, dentine being the enamel—which are disclosed upon the surface form a fine and efficient grinding instrument. The intermediate stages between the molar of a modern elephant and that of a mastodon are so fully known that it is not possible to draw a definite line between the two types of tooth-structure (see fig. 1, II, III, IV).

As regards the mode of succession, that of modern elephants is very peculiar. During the complete lifetime of the animal there are but six cheek-teeth, which it will be convenient to allude to as molars, on each side of each jaw, with occasionally a rudimentary one in front, completing the typical number of seven. The last three represent the molars of ordinary mammals, those in front are milk-molars, which are never replaced by permanent successors, the whole series gradually moving forwards in the jaw, and the teeth becoming worn away and their remnants cast out in front, while development of others proceeds behind. The individual teeth are so large, and the processes of growth and destruction by wear take place so slowly, that not more than one, or portions of two, teeth are ever in place and in use on each side of each jaw at one time, and the whole series of changes coincides with the usual duration of the animal's life. On the other hand, the earlier representations of the proboscidean series referred to below have the whole of the cheek-teeth in place and use at one time, and the milk-molars vertically displaced by premolars in the ordinary fashion. Among mastodons transitional forms occur in the mode of succession as well as in structure, many species showing a vertical displacement of one or more of the milk-molars, and the same has been observed

---

1 Cuvier's order Phacodermata (Gr. ὑφασύς, thick and ἄπασα, skin), containing the elephants, hippopotami, rhinoceros, swine, tapirs, hyraxes, &c., is now abandoned, its members now forming the orders I. Elephas and IV. Proboscidea and the sub-order Parabas-cyctea. A few Artiodactyla are also included.

---

FIG. 1.—Longitudinal Sections of the Crowns of Molar Teeth of various Proboscideans, showing stages in the gradual modification from the simple to the complex form. The dentine is indicated by transverse lines, the cement by a dotted surface, and the enamel is black.

I. Mastodon americus; II. Elephas (Stegodon) insignis; III. Elephas primigenius; IV. Elephas africanus;
in one extinct species of true elephant (Elephas planifrons) as regards some of these teeth.

Most proboscideans are animals of large dimensions, and some are the most colossal of land mammals. The head is of great proportionate size; and, as the brain-case increases but little in bulk during growth, while the external wall of the skull is required to be of great superficial extent to support the trunk and the ponderous tusks, and to afford space for the attachment of muscles of sufficient size and strength to sole. The hind foot is smaller and narrower than the front. The liver is small and simple, and there is no gall-bladder. In form the brain resembles that of the lower orders of mammals in that the cerebellum is entirely behind and uncovered by the cerebral, but the hemispheres of the latter are richly convoluted.

Elephants are exclusively vegetable-feeders, living chiefly on leaves and young branches of forest trees and various kinds of herbage, or roots, which they gather and convey to their mouth by very versatile proboscis, an organ which combines in a marvellous manner strength with dexterity of application, and is a necessary compensation for the shortness and inflexibility of the neck, as it is by this that many of the functions of the lips of other animals are performed. By its means elephants are enabled to drink without bending the head or limbs. The end of the trunk being dipped, for instance, into a stream or pool, a forcible inspiration fills the two capacious air-passages in its interior with water, which, on the tip of the trunk being turned upwards and inserted into the mouth, is ejected by a blowing action, and swallowed. Or if the animal wishes to refresh and cool its skin, it can throw the water in a copious stream over any part of its surface. Elephants can also throw dust and sand over their bodies by the same means and for the same purpose, and they have frequently been observed fanning themselves with boughs held in the trunk.

Following the definition of the Family Elephantidae, the type of the family Elephantidae: Dentition: i. 3, c. 1, p. 52–56.

The incisors variable, but usually of very large size, especially in the male sex, directed somewhat outwards, and curved upwards, without enamel except on the apex before it is worn; preceded by small molar tooth and followed by the premolar tooth, and the tusks only have replacement from before backwards, never more than one or part of two being in use on each side of each jaw at the same time; each composed of numerous flattened enamel-covered plates or ridges of dentine, projecting from a common many-rooted base, surrounded and united together by cement. The number of plates increases from the anterior to the posterior molar in regular succession, varying in the different species, but the third and fourth (or the last two) are the longest and the others are often wanting. They have the same number of ridges, which always exceeds five. Skull of adult very high and globular. Lower jaw ending in front in a deflected, spout-like symphysis. Vertebræ: C. 7, D. 19–21, L. 3-4, S. 1, C. 26–33.

The two existing species of elephant are the Indian or Asiatic (Elephas maximus), and the African (E. africana), the distinctive characteristics of which are given under Elephant. See also Mammoth and Mastodon.

Extinct Proboscidea

Elephas.—The extinct representatives of the Proboscidea are of the greatest importance and interest, since they serve to connect the modern elephants with ungulates of more ordinary type. The Mammoth (Elephas primigenius) is treated in a separate article. Nearly allied is E. armeniacus of Asia Minor; but E. antiquus, of which the remains are abundant in many of the superficial formations of England and Europe generally, approximates in the structure of its molar teeth to the African elephant. It is represented in the Pleistocene of India by the closely allied or identical E. namenticus. Affinity with the African species is strongly marked in the case of the dwarf elephants of Malta (E. melitensis) and Cyprus (E. cypriotes); and the gigantic E. meridionalis, of the “forest-bed” of the east coast of England and the Upper Pliocene of the Val D’Arno, has likewise molars showing the broad lozenges of enamel-bordered dentine characteristic of the African type. These and other species indicate, however, that, so far as dental characters are concerned, generic separation of the African from the Asiatic elephant is impossible. In North America the mammoth occurs in the far north, E. columbi, more akin to E. antiquus than the Central Tusker or Emperor (allied to E. meridionalis) in the south. The oldest representatives of this group are E. hyusdrus and E. planifrons of the Lower Pliocene of Northern India; the latter of which developed premolars vertically replacing the anterior teeth of the molar series.

From E. planifrons there is an almost complete transition to the ridge-toothed elephants, such as E. ganesa, E. insiguis,
E. bombifrons and E. clifti, typically from the Lower Pliocene of India and Burma, but some of which extend eastwards to Java, Borneo, China and Japan. These constitute the group (or genus) Stegodon, and are characterized by the lowness of the crowns of the molar teeth, in which the tall plates of the more typical elephants are reduced to low ridges with more or less completely open valleys between them; the number of ridges in each tooth is always much lower than in the corresponding teeth of the typical elephants. Premolars, vertically replacing the anterior molars, were often developed. These stegodont elephants appear to have been confined to India and the countries farther east, and exhibit an almost complete transition, so far as dental characters are concerned, to the mastodons of the same region.

Mastodon.—The connexion between the stegodont elephants and the mastodons (see Mastodon) is formed by the Indian and Burmese Mastodon latidens and M. cauleyi. In fact the main distinction between these animals and the stegodont elephants is the smaller number of ridges in the third, fourth and fifth molars, which is usually four, and never exceeds five, whereas in the stegodonts it is at least six and the numbers are not the same in each of the three teeth. In the two species named the transverse ridges are more or less continuous. Many other species, such as the European M. arvernensis (see fig. 2 in art. Mastodon) and the Indian M. simelansis, have, however, the ridges broken up into columns, or cones, more or less alternately arranged, and thus blocking the intermediate valleys. In these species, which are of Pliocene age, there are four ridges in molars 3, 4 and 5; but in the Pleistocene North American M. americanus (as well as in many other species) these are reduced to three in each of the aforesaid teeth. The lower jaw of the latter species frequently shows small tusks, which are, however, generally shed in mature age. Premolars, which vertically replace some of the anterior molars (milk-molars), are developed in many species, although not in M. americanus. Species of the genus are found over the greater part of the world, inclusive of Europe, Asia and North and South America; M. humboldti being the best known South American species. A single tooth referable to this or the next genus has been obtained from South Africa.

Tetrabelodon.—The more primitive mastodons constitute the genus Tetrabelodon, and are characterized by the presence of a pair of short chisel-shaped tusks in the lower jaw, which is prolonged into a trough-like chin for their support; tusks being also present in the upper jaw. These animals were provided with a snout-like muzzle instead of a trunk (see Mastodon). Their birthplace was Africa; the Miocene European M. angustidens having been discovered in Egypt in strata overlying those from which were obtained the remains of the under-mentioned more primitive genera. Tetrabelodon mastodons were, however, by no means confined to the Miocene, Tetrabelodon longirostris occurring in the Lower Pliocene of Europe, and T. ponditios in that of India. Most of these four-tusked mastodons were smaller animals than modern elephants.

Palaeomastodon.—No proboscidean earlier than Tetrabelodon occurs in Europe, but the group is represented in the Upper Eocene of Egypt by a smaller and more primitive type known as Palaeomastodon. This genus resembles Tetrabelodon in having four pairs of tusks, but differs in the less elephant-like skull, and the simpler character of the molar teeth, of which five pairs were in use at one time, whereas in Tetrabelodon and Mastodon there were never more than two pairs and a portion of a third in simultaneous wear.

Moeritherium.—The earliest representative of the proboscidean stock at present known is Moeritherium, from the Middle Eocene of Egypt, which includes still smaller animals, whose relationship to Elephas would scarcely be realized were it not for the intermediate links. All six pairs of cheek-teeth (pm. 2–m. 3, fig. 3) were in use at once, and there was a comparatively full series of teeth in the front of the jaws; while the premolars were preceded by milk-molars in the normal manner. Very significant is the enlargement of the second pair of incisors in each jaw, thereby foreshadowing the tusks of Tetrabelodon. There was, however, no lengthening of the chin, so that the muzzle was probably of normal proportions. This animal was not larger than a tapir.

Dinotherium.—The huge proboscidean from the Lower Pliocene and Middle Miocene strata of Europe and India, known as Dinotherium, indicates a type off the line of descent of the elephants. Upper tusks were apparently wanting, but the lower jaws carried a pair of large tusks bent downwards in a peculiar manner (fig. 4). The cheek-teeth formed five pairs, all in use at one time, and premolars vertically replacing milk-molars in the ordinary fashion. The ridge-formula of the permanent teeth of the cheek series was 2.2.3.2.2.

Barytherium and Pyrotherium.—Very problematical are the
affinities of *Barytherium* of the Egyptian Eocene and *Pyrotherium* of the Lower Tertiaries of Patagonia; although it is possible that they may both be offshoots from the primitive proboscidean stock. *Pyrotherium* had a pair of upwardly directed tusks in the lower jaw. The cheek-teeth are five in number and carry transverse ridges similar to those on the molar of *Dinotherium*, although there are only two to each tooth. If really related to the Proboscides, *Pyrotherium* may be derived from the African ancestral stock of that group which reached South America by way of a former land-connexion between that continent and Africa. So far as can be determined, *Barytherium* approximates in many respects to *Dinotherium*, but in others seems to approach *Unimammalia* of the North American Tertiaries (see AMBLYPODA).

**PROBOSCIS**—**PROCESS**

The trunk of an elephant (Gr. ἐρεσθονις, ἐρο, before, βοσκειν. to feed), the long flexible snout of the order of Mammalia called *Proboscidea* (q. v.), which embraces the elephant and its extinct allies the mammoths and mastodons. The term is also applied to the snout of the tapir and of the *kalah* or proboscis-monkey or proboscis mole. The proboscis is more particularly to the elongated parts of the mouth of various insects, such as the *rostrum* or beak of a rhinoceros beetle, the antilia of *Leptidoptera*, the sucking mouth of the house-fly, &c. Various worms possess a tubular structure which can be extended at the anterior portion of the body, and some gastropods a sucking tongue, to both of which the name "proboscis" is applied.

**PROBOSCIS-MONKEY**, a large, long-tailed, red Bornean species characterized by the extraordinary prolongation of the nose of the adult male, which hangs, however, down in front of the upper lip and does not stand straight out from the face in the manner commonly represented in pictures. From this feature the species, which is the only representative of its genus, derives its name *Nasalis larvatus*. In females and young the nose is less developed, with a tendency to turn upwards in the latter. This monkey is a leaf-eater, nearly allied to the langurs, as typified by the sacred ape of India. (See PRIMATES.)

**PROBUS, MARCUS AURELIUS**, Roman emperor A.D. 276 to 282, was a native of Sirmium in Pannonia. At an early age he entered the army, where he distinguished himself under the emperors Valerian, Claudius and Aurelian. He was appointed governor of the East by the emperor Tacitus, at whose death he was immediately proclaimed his successor by the soldiers. Florianus, who had claimed to succeed his brother, was put to death by his own troops, and the senate eagerly ratified the choice of the army. The reign of Probus was mainly spent in successful wars by which he re-established the security of all the frontiers, the most important of these operations being directed to clearing Gaul of the Germans. Probus had also put down three usurpers, Saturninus, Proculus and Bonosus. One of his principles was never to allow the soldiers to be idle, and to employ them in time of peace on useful works, such as the planting of vineyards in Gaul, Pannonia and other districts. This increase of duties was naturally unpopular, and while the emperor was urging on the draining of the marshes of his native place he was attacked and slain by his own soldiers. Scarcely any emperor has left behind him so good a reputation; his death was mourned alike by senate and people, and even the soldiers repented and raised a monument in his honour.

Life by Vopiscus; Zosimus i. 64; Zonaras xii. 29; Aurelius Victor, *Caesar and Epit.* 37; H. Schiller, *Geschichte der römischen Kaiserzeit* (1883), vol. i.; E. Lépaule, *Étude historique sur M. A. Probus d'après la numismatique* (1895); Pauly-Wissowa, *Realencyclopaedie*, ii. 2516 (Henne).

**PROBUS, MARCUS VALERIUS**, of Berytus, Roman grammarian and critic, flourished during the reign of Nero. He was a student rather than a teacher, and devoted himself to the criticism and elucidation of the texts of classical authors (especially the most important Roman poets) by means of marginal notes or by signs, after the manner of the Alexandrine grammarians. In this way he treated Horace, Lucretius, Terence and Persius, the biography of the last-named being probably taken from Probus's introduction to his edition of the poet. With the exception of these texts, he published little, but his lectures were preserved in the notes taken by his pupils. Some of his criticisms on Virgil may be preserved in the commentary on the *Bucolics and Georgics* which goes under his name. We possess by him part of a treatise *De notis*, probably an excerpt from a larger work. It contains a list of abbreviations used in official and historical writings (especially proper names), in laws, legal pleadings and edicts.

The following works have been wrongly attributed to him. (1) *Cathobica Probi*, on the declension of nouns, the conjugation of verbs, and the rhythmic endings of sentences. This is now generally regarded as the work of the grammarians Marius Plotius Sacerdos (3rd century). (2) *Instituta artium*, on the eight parts of speech, also called *Ars satiiana* from its having been found in a Vatican MS. As mention is made in it of the baths of Diocletian, it cannot be earlier than the 4th century. It is possibly by a later Probus, whose existence is, however, problematical. (3) *Appendix Probi*, treating of the noun, the use of cases; rules of orthography (valuable in reference to the pronunciation of Latin at the time), and a table of *Differentiae*. As the author has evidently used the *Instituta*, it also must be assigned to a late date. (4) *De nomine excerpta*, a compilation from various grammatical works.

See T. Steup, *De Proba grammatica* (1871); Teuffel-Schwake, *Hist. of Roman Literature* (Eng. trans.), 301.

**PROCEDURE** (Fr. procédure, from Lat. procedere, to go forward), in general, a method or course of action. In law, procedure may be defined as the mode in which the successive steps in litigation are taken. As a term in English law it dates only from the passing of the Common Law Procedure Acts 1852-1860; it is usually coupled with, or more often replaced by, the word "procedure." The procedure of the High Court of Justice in England is governed by the rules of the supreme court, which are published in the *Annual Practice*. Procedure has been defined (per Lush, J.J., *Poyser v. Minor*, L. R. 7 Q.B.D. 329), as "the mode of proceeding by which a legal right is enforced as distinguished from the law which gives or defines the right, and which by means of the proceeding the court is to administer; the machinery as distinguished from the product." T. E. Holland (*Elements of Jurisprudence*, 1906, p. 86) describes procedure, or "adjective" law, as that part of law which provides a method of aiding and protecting rights.

See the articles on the various branches of law, as Admiralty Jurisdiction, Criminal Law, Divorce, &c.; also Action, Appeal, Evidence, Pleading, Summons, Trial, &c.

**PROCESS**, a general term now technically employed for the photo-mechanical processes by which illustrations are reproduced in printing. Until the last quarter of the 19th century reproductive processes, save as regards line reproduction, can hardly be said to have had an existence. Paintings, drawings, and engravings, which it was desired to put into form which by means of the printing-press could be multiplied indefinitely had to go through a process of interpretation by an engraver or draughtsman, who, on a metal plate, a block of wood or stone, gave a rendering of the original subject. The means at his disposal were lines and dots, which, varying in their thickness and proximity, expressed dark or light passages in the scheme of light and shade of the original. It will readily be understood how by this process of interpretation the fine art instincts would produce a result as distinct in character as an engraving as was the original as a painting or drawing, and engravings were sought after as works of art, and treasured for their artistic qualities. But engraving of this kind took time. Years were devoted to the production of one steel- or copper-plate, while wood engravers who were artists could only work on a block when in the mood; and for that mood the publisher had to wait, and he grew impatient and was willing to accept rapid interpretation of originals by men who could produce them under other than artistic conditions. But the pain of the artist at the bad rendering of his original was often great, so that he, not less than the publisher, though for another reason, hailed
the attempts that were being made to reproduce his work mechanically without the intervention of the translator or interpreter. The ideal of an artist would naturally be a reproduction of his work in facsimile, which retained all, or as many as possible, of the individual characteristics of his work; and to give him this was the aim of the school of wood engravers which originated in the United States and made a last stand to maintain the position of their art in the field of book illustration. By a system of extremely fine work the American wood engravers were able to keep much closer to the tones of an original than had previously been possible; but the result was obtained at the sacrifice of the artistic rendering of the best old engravings, and was so mechanical in its character that when it had to compete with a real mechanical process the engraving could not hold its ground, the enormous difference in the cost of production being a factor of sufficient importance in itself to make it impossible for the engraving to retain the field. A similar development had been going on in the other branches of engraving. The line engraver and the etcher, to whom had been entrusted the interpreting of works of art first produced in other forms, found themselves faced by mechanical reproductions in plate form which, while preserving more of the character of the original, work, were produced in much less time and at a greatly reduced cost. It has thus come about that the last quarter of the 19th century witnessed the dispossession of the hand engraver from the field of interpretative engraving, and the occupation of his position by the chemist and the mechanician.

The term "process," which has come to be applied to all photo-mechanical reproductions, is a somewhat unfortunate one, inasmuch as it is descriptive of nothing. From time to time various names have been given to its varying forms, indicative either of the name of the inventor or of some peculiarity of method. Zinography, gillotype, photogravure, heliogravure, heliotype, phototype, altotype, are illustrations of the kind of names that are often to very slightly varying applications of the same principle, but usage has come to apply the term "process" to any printing surface that is produced by chemical and mechanical means. The whole of these processes may be arranged under three heads: (1) relief; (2) intaglio; (3) planographic.

1. Relief Processes.—An engraving in relief is one in which the printing surface stands up above the surrounding ground. The history of the development of relief processes is really the history of photography (q.v.); for whilst attempts were made to obtain results without the aid of photography, by drawing upon plates with prepared chalk or ink, "rolling them up" with printer's ink and etching away the ground with acid, as in the case of zinography; the real progress of all process has been upon the lines of photography; and to Niepce and Daguerre may be attributed the origin of the modern mechanical and chemical processes.

Speaking broadly, all the modern "processes" are the outcome of a discovery by Mungo Ponton that a preparation of albumen or other colloidal substance and bichromatic of potash could be hardened and rendered insoluble and nonabsorbent in water by exposure to light, and that as a photographic negative permitted the passage through it of light in varying degrees of intensity, so a film of the preparation placed under a negative was liable to be hardened and rendered insoluble in degrees varying with the intensity of the light affecting it. This discovery governs the production of process blocks or plates of all kinds.

The methods of reproduction of pure line work differ greatly from those for the reproduction of originals in tone. As the first necessity in securing a good result is the suitability of the original to be reproduced, it is desirable to make clear the character of a good original. This should be of one tone or degree of colour all through. It may be all grey; it is better that it be all black. It may not be black in parts only and grey in others. The lines of an original may be of any variety of thickness. It is necessary, therefore, for the draughtsman to see that he works with a good black ink, or ink that will tell as black when it is exposed to the photographic plate. Inks of a warm tone—that is, inclining to red or orange—yield better results than cold inks which incline to blue.

Most prepared liquid inks have a tendency to lose their blackness by exposure to the atmosphere on the removal of the cork from the bottle. The ideal ink is one freshly ground from a dry cake of colour when beginning work. Indian ink is good if well ground and kept in an air-tight bottle. It has the advantage of not washing up when colour in washes is passed over it, but it must be used freshly ground. The addition of a little Indian yellow, burnt sienna or sepia, gives a warmth of tone to it and makes it suitable for the original. If, however, it has been prepared by Bourgeois of Paris, it appears to be prepared with the admixture of some warm colour with the black base. It is a good ink for the purpose, and is prepared both in solid and liquid form. Lautrec's ink gives off a slight red in which does not rivet black, which is warmer in tone than lampblack. Higgins' Indian ink or American drawing ink is an American ink made in liquid form which has the reputation of not fading by exposure. Stephens's Ebony Stain is a black paint which dries; if a little liquid pen; if thick and dries, it cracks off and does not corrode the pen.

Besides the pen a brush brought to a fine point is much preferred by some artists, as it yields a line less monotonous than that given by a pen, though the brush cannot be used so freely. The paper used should be smooth and as white as possible. A paper is made with a surface coating of white chalk, which admits of the use of a scraper to remove lines or to break them up.

It is not possible to lay down a rule for the amount of reduction to be made when photographing for the reproduction; the finer the drawing the less should be the reduction made; but experience is the only guide. Sometimes, where the lines are very fine and the drawing minute in character, an enlargement is desirable. Where drawings are reduced too much, there is a tendency for the spaces between the lines to fill up, and to give a coarse, heavy result. Faulty drawing is not lessened by reduction. On the contrary, the fault becomes more evident, so is desirable to make all necessary corrections in the drawing. The usual method of reducing a line drawing which has been photographed to the size of the required block. The negative is taken absolutely dense except where the lines of the drawing have affected it, and these are absolutely clear, admitting the unrestricted passage of light through them. A piece of planished copper or zinc is prepared or made sensitive to light by a preparation of albumen or gelatin and bichromate of potash spread upon its surface. The negative is laid upon the sensitized metal and placed in the light in the way an ordinary photograph is printed. The light passes through the transparent lines of the negative and hardens the bichromated film beneath them. Both negative and plate are then taken into a darkened room, where the metal plate is rolled with an inked roller, placed in a bath of cold water and allowed to soak until the albumen and bichromate becomes so softened everywhere, except where the light has hardened them, that they all wash away, and nothing is left but the hardened lines. The lines are dusted with asphalt, which by heat is melted on to them and makes a ground which resists the action of acid. A coat of varnish is put over the back and edges of the plate, to protect them from the acid also, and only the spaces between the lines on the surface are left free to its action. The plate is then placed in a bath of dilute nitric acid, which eats away the metal wherever it is exposed; but it leaves the lines of the drawing, which are protected by the hardened film standing up above the eaten or etched surface; and these lines, which correspond to those of a wood engraving, are the printing surface of the plate. The plate is mounted upon a wood or metal block, made type-high, and it can then be used along with type in the printing-press.

Various devices have been resorted to that effects of tone may be obtained by means of the simple line process. Grained papers have been charged with dots of dots or lines crossing at right angles, or rows of dots give the papers a heavy, flat, "tone," upon which a drawing can be made in pencil, chalk or ink, and gradations of tone introduced by means of scrapers, while original drawing which has to be reproduced is black ruled lines or dots leaving, if desired, high lights of pure white. A drawing on such
paper consists of lines or dots, a combination of the original lines or dots of the paper and those of the drawing itself, the scraper splitting up lines into dots or removing them altogether. The result is quite easily reproduced by the line process. Another method used when necessary, and known as Day’s “shades” or shading mediums. They are transparent films of gelatin which have upon them lines or dots in varying combination in relief, so that they can be inked up by a roller. When placed over a drawing, their special purpose is to enable the operator to see exactly what passage he is dealing with, and he can by means of a burnisher impress the lines or dots of the shade upon any passage of the drawing; these lines or dots then become part of the drawing, and are reproduced in the same way.

Pencil or chalk drawings upon simple white-grained paper, where the pencil or chalk passing over the ruts or hollows in the paper makes a mark on the top of the grain only, are also reproducible by the line process. The drawing and the wax can be handled and dealt with very much more readily and difficult to deal with. The difficulty led to the invention of a process by Mr. Matheson, who, not having the capital to work it, joined the late Mr. Dawson, senior, whose sons continued to work the process with Mr. Matheson under the name of the Swelled Gelatin Process. It is based upon the fact that gelatin, sensitized with bichromate of potash, swells when placed in water, and swells in proportion to the amount of light to which it has been exposed. A negative taken from a drawing which varies in tone, not being thoroughly black all through, varies in the quality of its transparent lines and dots; and when a piece of paper or glass coated with sensitized gelatin is exposed to the light of such a drawing, it will be found, according to the amount of light the negative allows to pass, after making a print on such paper or glass, it is placed in a dish of water and the surface allowed to swell, that it does in varying degrees, the portions most affected by light, and least affected by light, swell to the greatest extent. The hard lines of the drawing not swelling at all. This swelled print is then placed in a frame, and a preparation of plaster is poured upon it to make a mould of its surface. When this has set and the gelatin print is removed, the mould is coated with a preparation of wax, which sets in a few minutes sufficiently for it to be released from its plaster mould. Additional wax is built up when necessary upon the whites, as they are technically called—that is, upon the parts which require relative amounts of wax to be added to the mould, and the mould is then set aside. The hollows in the block—so that these may be as deep as possible; and this wax mould is electrotype in copper. The lines and dots of this copper block, which when finished is backed up with metal and mounted on a slab, is cut away or filed away from the height of the low dots, so that the low dots will not come so close in contact with the inking roller or with the paper, and so produce when printed a grey impression corresponding to the greyness of the original drawing.

The drawback to the use of the process is that it is about three times as costly as the ordinary process. It is a method much used for the reproduction of line and stipple engravings, where fine dots and lines are apt to be printed in delicate tones. The finest results are obtained by procuring the mould from the plaster mould and wax casts, and by coating the sensitized gelatin with plumbago or other impalpable metal preparation which will enable it to receive a copper deposit to qualify it to take its place in the electrotype. The deposit of copper is made on the surface of the gelatin itself; but this needs to be done with the greatest care, and is still more costly.

A non-photographic process of obtaining line blocks in relief has been for a long time successfully worked by Messrs. Dawson. A brass plate is coated with a film or ground of wax upon which a tracing of the drawing to be reproduced may be rubbed down. By means of an etching needle the lines of the drawings are incised upon the thin wax ground down to the surface of the brass plate. A pencil of wax and a pencil of hot metal are then used to produce a flow of melted wax which drops from the wax pencil upon the ridges of wax between the lines and builds them up greater and greater. Generally the lead of this pencil may run into the incised lines has to be carefully guarded against, but skilful treatment manages so that it stops at the edges and does not run over. In maps and diagrams where lettering or figures are introduced, the wax is allowed to run into the wax over the type in the ordinary rapid printing process. It is only possible to approximate to the printing of a flat or graduated tone by producing a broken or granulated surface which shall present a series of lines or dots that, when inked and impressed upon paper, shall by the variations of proximity and size give the impression of an unbroken tone. This necessitates the lines or dots being so small that the eye shall not at a glance appreciate the broken-up character of the surface of the block. Many efforts resulted in the production of what is known as the screen, which itself was only made possible by the invention of ruling machines of a delicacy previously unknown.

A screen is made by coating a sheet of glass—which must be flawless both as to body and surface—with a composition analogous to the ground used by an etcher to coat his plate before drawing upon it with his needle. The glass so coated is placed in an automatic ruling machine, of which the ruling point is a diamond, and which can be adjusted so as to rule any number of lines from 50 to 300 to the inch. The lines are ruled diagonally on the glass, and at mathematically equal distances from each other. The sheet of glass, after ruling, is treated with hydrofluoric acid, and the lines where the ground is cleared away by the diamond point are etched or bitten into it. The plate is cleaned up and an opaque dark pigment rubbed into the glass. Two such ruled sheets of glass are sealed together face to face with Canada balsam, with the diagonally ruled lines crossing each other at right angles, the result being a grating or screen containing innumerable small squares of clear glass through which the light can pass, which it cannot do through the ruled lines, which are filled by the opaque pigment.

To produce a half-tone block from a picture, a black and white drawing in tone, or a photograph, a negative is exposed in the camera in the usual way, with this screen quite close to it but not in contact; and the subject is photographed on to the negative through the screen, and what is termed a “screen negative” is the result. It is a photograph so much of the original as could affect the negative through the little clear squares of the screen, and represents the tones of it by innumerable dots and lines, the size and proximity of which are regulated by the fininess or coarseness of the screen used.

In the early days zinc was the metal used for these half-tone blocks; but experience showed that though more difficult to etch to the necessary depth, the closer, denser texture of copper rendered plates of this metal much more suitable for the production of the best blocks, and zinc now is used only for inferior blocks. Whichever metal may be used, a sheet of it, most carefully planished, is sensitized with a coating of gelatin or fish-glue and bichromate of potash, dried and exposed under the screen negative to the action of light, as in the ordinary method of photographic printing. The action of the light hardens the gelatin film, the portion not so hardened being soluble by water. The plate with the gelatin picture in lines and dots is exposed to heat and the image is burnt in on the surface of the metal like an enamel, which enables the photographic picture to resist the subsequent etching. The plate is placed in a bath of iron perchloride and etched until sufficient depth is obtained. Wherever the surface of the plate is free from the lines and dots, it is bitten away by the perchloride, and the lines and dots are left in relief. This first biting in the bath produces a rather flat general impression of the original, and is termed “rough etching.” To produce finer results, and to bring out the contrasts of black and white necessary to a good reproduction, the block has to go through processes of stopping out and rebiting similar to those of etching an intaglio plate. This “fine etching” calls for the artistic taste and judgment of the craftsman; and with a good photograph to work from the final quality of a block will depend largely upon its treatment by the fine etcher. A substitute for the acid bath has been found in an acid blast. The acid is driven in the form of a spray with some force on to the surface of the prepared plate, which it etches more rapidly and more effectively than the blast of the printed type in the ordinary rapid printing process. It is only possible to approximate to the printing of a flat or graduated tone by producing a broken or granulated surface which shall present a series of lines or dots that, when inked and impressed upon paper, shall by the variations of proximity and size give the impression of an unbroken tone. This necessitates the lines or dots being so small that the eye.
matter of extreme difficulty, the underbitten points breaking or tearing away in the mould. To avoid this underbitten a fatty ground is laid over the surface of the block each time it is etched; by exposure to heat this ground is sufficiently melted to permit of its running down the sides of the upstanding points, and so giving them the required protection. The acid blast is less liable than the bath process to etch away the sides of the dots.

This method of making tone relief blocks is most generally known as the “Meisenbach” process, from Meisenbach, of Munich, who was the first to make it commercially successful, but the history of its development is somewhat obscure. Fox Talbot as early as 1852 took out a patent for using a screen of grape or muslin; he also suggested dusting glass with a fine powder to produce a grain screen. All the early ruled screens were single line, and the credit is due of suggesting the shifting of the single line screen during the operation and, by reversing it, producing the effect of the double line, to Sir Joseph Swan, who patented the process in 1879. Meisenbach’s patent for a similar method is dated 1882. The development of the screen was the important factor in the development of the process. The early screens were photographs of ruled plates and the great advance was made by Max Levy of Philadelphia, who made it possible by his ruling machines to produce screens of a fineness and clearness not previously practicable. It was F. E. Ives who, in 1886, introduced ruled screens placed face to face and sealed up so as to produce cross-lined screens.

The chief objection to this process is its inability to reproduce the extremes of expression employed by the artist in black and white; actual white is impossible, and delicate tones, such as are characteristic of skics, are destroyed by the cross-bar lines of the screen, which cover down all light passages and rob the reproduction of that brilliancy which characterized wood engraving. It is true that the addition of hand engraving can be resorted to in the case of the process block, and lights and other varieties of tone and form introduced, but this can only be done on blocks of very fine texture, and the cost of reproduction is greatly increased by the introduction of such handwork by the engraver.

The most important development of the half-tone process is in the direction of the reproduction of works in colour by means of relief blocks. The theories of colour (q.e.) in light and in pigments enter largely into this development. White or solar light is composed of rays of light of three distinct colours, red, green and violet, which are called the primary or fundamental colours because by their combination in various proportions all other tones of colour are produced, but they cannot themselves be produced by any combination of other coloured rays. The theory of pigmental colour differs from this in that the primary or foundation colours from which all others are produced, while being themselves unproductive by any admixture, are blue, red and yellow, and while the combination of the red, green and violet of the scientist produces white, the combination of the primaries of pigments in their full strength produces black.

Colour is the result of the absorption and reflection of the rays of light which strike upon a body. The rays which are reflected are those which affect the vision and produce the sense of colour.

Should the object absorb all the rays it appears black, should it absorb none but reflect all it is white, and between these two extremes lie an infinite variety of tones. Filters have been made which absorb and refuse passage to certain coloured rays, while permitting the passage of others, e.g. a photographic filter of a certain colour will absorb and stop the passage of red and green rays, while permitting the passage through it of the violet. It will then be perceived how, when a picture or other coloured object is placed before a camera, with one of these filters between it and the exposed negative, the rays of light of the colour which can pass through the filter to the negative will be the only ones which can affect it, and that it is possible in this way to secure on three separate negatives a record of the green, red and violet rays which are reflected from its coloured surface by any object placed before the camera.

These records are coloured photographs; they are simply ordinary negatives, records of colour values which may be translated into colour by the use of coloured inks. The principle governing the process is analysis or separation followed by recombination. Positives are made from these colour records, from which by means of the rule screens already described half-tone process blocks are made which, when printed one over the other in coloured inks, combine again the colours which were separated by the filtering process and give approximately a reproduction of the original in its true colours. The colour used with each block must have a relation to the filter used in its production. It must represent a combination of the two colours stopped out by the filter when making the negative from which the block was made, that is to say, the colour used must be complementary to the colours stopped out. Certain subjects which are amenable to long exposures can be dealt with by what is known as the “direct process,” whereby the screen negative and the colour record are made by one operation on the same plate. By this means six of the fifteen otherwise necessary operations are saved, but the method is not always practicable.

As far back as 1861 the suggestion was made at the Royal Institution by Clerk Maxwell to reproduce objects in their natural colours by superimposing the three primary colours. Later Baron Ransoms, of Vienna, Mr Collen, a gentleman who taught drawing to Queen Victoria, and two Frenchmen, MM. Chas. Cros and Ducos du Haurn, carried on the idea and made experiments with the aid of photography, which were still further developed in Germany by Professor Husnik, of Prague, Dr Vogel, of Berlin, and others; but it was in America that the first three-colour blocks for letterpress printing were made, F. E. Ives, at Philadelphia, being their maker in 1881.

This three-colour relief process has made great advances in recent years. The first great practical difficulty which had to be overcome was to produce three screen blocks which could be printed one over the other. Were the screens of each block used at the same angle, the lines and dots would print on the top of one another; but a great deal of the colour result depends on the considerable proportion of each colour being done on the white paper. Artists know well that much purer and more brilliant results are produced by placing touches of colour side by side than one over another; small patches of red and blue, placed side by side, yield to the eye a purple of much greater purity and beauty than the same touches of colour worked one over the other. Consequently it was found necessary to turn the screen at a different angle for each block, so that the lines should not fall on each other but should cross each other; but the risk of this is that, used at certain angles, the crossing of the screen lines will produce what is known as the moire antique result. Vogel took out a patent in Great Britain for the process, and he therein stated that the screens should be used at certain stated angles. He also proposed to use single-line screens, similar to those used by F. E. Ives at Philadelphia, instead of cross-line; but it has since been found that the cross- or double-line screens can be used successfully; and that the angle at which they can be used is not a fixed one.

Filters are made in a dry or wet form. The dry filter is made by spreading a film of gelatin or collodium, tinted with aniline colour, upon a piece of glass. The wet filter is made through made of two sheets of glass, sealed all round and filled with water tinted with aniline dye or colour. The accuracy of the tint of the colour-filter may be tested by the spectroscope, or by an instrument invented by Sir William Allan and known by the name of the reflectometer. This is a theoretical test. The practical test is by photographing through them patches of blue, red, and yellow. If, for example, the filter for blue records the full strength of blue with the full strength of the colour, and for yellow a little less, and for red nothing, it is practically a true filter. It is possible to treat the negatives themselves so as to render them more sensitive to the special colour they are intended to record. Indeed Dr Albert, of Munich, has produced a collodion emulsion which is so sensitized that the various colour sensations are directly obtained without the interposition of a colour filter. Different makes of plates demand different colour-filters. (For colour-filter making see Ives,
PROCESS

Photographic Journal, vol. xx. No. 11). The preparation of these colour-filters calls for great perfection of quality in the materials employed, and great accuracy in the using of them. The glass, whether for the dry or wet filter, must be absolutely flat as to its surface, and its two sides must be absolutely parallel. In the wet process, the glasses forming the sides of the cell or trough must be parallel to each other.

Collodion is sometimes used in combination with the tinted collodion, but there is no particular advantage in this, because the two glasses are always used in the making of a filter, and each one may, if desired, be coated with different dyes and afterwards cemented together with Canada balsam.

The following dyes or their equivalents form a basis for nearly all three-colour filters:

For the red printing negative
Brilliant green.
Brilliant yellow.
Cochineal red.
Brilliant yellow.
Methyl violet.
Naphthol green.

The first dye named is the base colour in each case, the second is employed in small proportions to produce the required modification of tint.

The theory of the three-colour process is that the same three colours shall be used for the printing of every subject; and there is no doubt that if the filtration were perfect and the printing inks absolutely pure, the theory would work fairly correctly in practice; but there is room for improvement in both these matters, and the result is further complicated whenapplication is made of special pigments, which makes it difficult to print subjects together. Special care is called for on the part of the printer. There must be the most perfect register of the printing subjects, otherwise a blurred effect results; there must be constant watchfulness to see that there is no excess of ink of any one colour, or the whole scheme of colour will be destroyed. This three-colour process has been a rather long time in establishing itself and nothing has so tended to retard it as bad printing. Good blocks have been obtainable, but in the hands of ordinary printers they have yielded but indifferent results. It is hardly to be expected that the untrained eye of the ordinary printer should be successful anywhere where the work requires the cultivated judgment of an artist. There is one other necessity for success in all tone relief work, and that is the use of the right quality of paper and ink. The blocks are so delicate that the tonal fill up if an excess of ink is used. Ink of a good quality can be used in much less quantity than common kind, but it must be impressed upon paper that is sympathetic and will "bear out" the ink.

The best results can be obtained only with the use of what is known as "coated" paper. It is a paper which, after manufacture, is passed through a bath of a preparation of china clay, which by means of brushes is rubbed into the surface of the paper. When dry the paper is of high polish and of conservative to the smallest amount of ink. The polish of this coated paper is objectionable to many readers of illustrated books, and the clay adds considerably to the weight. Paper makers are, however, supplying a dull-surfaced high quality printing paper which is very good for artistic and scientific illustrations and obviates both the glossy surface and the supposed lack of permanency of chromo paper.

2. Intaglio Processes.—An intaglio engraving is one in which the printing surface is sunk below the surrounding portions of the picture, the lines or dots—pressed, cut or bitten into the surface—holding the ink which is to be impressed upon the paper when the original surface of the plate is removed by the acid. The old-fashioned steel engraving may be taken as the type of an intaglio plate, in which the lines which printed were cut into the surface of the plate, instead of being left standing up in relief, as in the case of a wood engraving.

"Photogravure" is the name by which the many processes are generally known by means of which intaglio engravings are made mechanically, "heliogravure" being another name for the process, or special application of it. Photogravure reproduces the tones of photographs or drawings, and gives the nearest approach to a facsimile reproduction that has yet been arrived at. Gelatin bichromated is the medium by means of which the photogravure plate is produced, but as the screen is not used in ordinary work, it is necessary to produce an ink-holding grain in some way upon the plate. This is done by allowing a cloud of bitumen dust, raised inside a box, to settle upon the surface of a copper plate; it is fixed by heat, which, though insufficient to melt it, is enough to attach the fine grains to the plate. Over this prepared surface is laid the film of bichromated gelatin, upon which is printed the subject through a glass positive; the usual hardening process takes place by the action of light, followed by a washing out of the unhardened portions of the gelatin. The plate is exposed to the action of ferric chloride, which attacks it most strongly in the least exposed parts, but which cannot eat it away in broad flat masses of dark, in non-exposed portions, owing to the existence of the bitumen granulation, which ensures the keeping of a grained surface even in the darkest passages.

Photogravure is a costly process to employ for illustration. The plates have to be printed slowly, with much hand work, as in the case of etchings. It is the printing that makes its use expensive, rather than the making of the plates; and as each plate must be printed separately and on special paper, it cannot be employed with type, like relief blocks.

There is much uncertainty about the production of plates by the photogravure method; and although great improvements have been made in the process, it is often necessary to produce several plates before a satisfactory one is obtained. In all these reproductive processes the more artistic the workman the better the results, and this is especially true of photogravure, in which the aim is to come very near to the original work of the artist designer than in the less perfect processes.

The method of Rousillon, which was adopted by Goupil in the production of photogravure plates in the early days of the process, was to prepare the surface of the plate with a secret preparation of certain salts, which crystallized under the action of light, so that when exposed under the negative the surface was broken up by this crystallization more or less, according to the amount of light the negative permitted to reach it. The plate with its crystallized surface was then electrotyped, and the electrotype was the plate used for printing. It was a deposit process, as opposed to an etching process.

Photogravure plates are made also by the use of the grain screen, in which the reticulations of the screen take the place of the bitumen powder in producing a grain; it is the inversion of the method by means of which points and lines are produced in the relief block. It has not, however, come much into favour, probably owing to the greater coarseness of the grain and the consequent loss of softness in the tones. An application of this method has, however, been made in the development known as the Rembrandt intaglio process. It is a secret process; but the secret lies more in the press by which the plates are printed than in the plates themselves, which are intaglio plates made with a very fine screen, and not to a cylinder.

The attempt to print photogravure plates by machinery was given up because the plates were too shallow, they would not stand the wear and tear, and they were too short and the results too indifferent; but the use of the grain screen renders possible stronger, deeper plates, that will stand harder wear. There is little doubt that the machine used is some form of the machine used to print wall-papers, in which there is a central cylinder engraved with the design, inked by rollers with which it comes in contact. The ink not only fills the intaglio or sunk portion which has to print the design, but covers as well the whole surface of the plate. To clean this surface, leaving ink only in the sunk dots and lines, another cylinder is employed, ground and grooved somewhat like the shaft of the common steel of the dinner table used to sharpen knives, the grooved surface of which, passing over the engraven cylinder, scrapes clean its inked surface, leaving ink only in the sunk portions, which will, as the cylinder comes in contact with the paper, deposit itself and print the picture. The results produced by the Rembrandt intaglio process are softer and smoother than those given by photogravure, and they are free from the gritty qualities which occasionally characterize photogravure; but they lack the brilliancy and depth of the latter. The process on the whole is less costly to use, mainly because the printing is so much more rapid, and is turned out by a machine instead of by hand.

A method of printing intaglio plates made from a screen

The three primary colours are separated out by photography, each colour sensation is etched on copper, and when the blocks representing Yellow (A), Red (B), and Blue (C), as illustrated above, are superimposed in the printing press the result (D) is a reproduction of the original in all its combinations of colour.
negative by the lithographic press was introduced and patented by Sir Joseph Swan and his son, Donald Cameron-Swan. The sunk surfaces are rendered receptive of lithographic ink while the surface of the plate itself is kept damp with water or glycerin and water, and remains clean and free from ink when the plate is rolled.

The monotype is not a new, but a revival of a somewhat old, method of reproducing on paper a painting by an artist. The design is executed on a plate by means of brushes, fingers or other tools, with paint or printer's ink. On the completion of the painting, paper is laid upon it, and plate and paper are together passed through a press, when the ink or colour is transferred to the paper. One impression only is possible, hence the name of the process. A method has been devised by Sir Hubert von Herkomer for duraling the painting with a first metallic powder, which in a tunnel to and renders the surface sympathetic to a copper deposit when it is placed in the galvanic bath, by which means an electrolyte of the painting, with its varying relief surfaces, is obtained, and forms a plate from which numerous impressions can be taken.

The very large number of impressions it is often required to get from the etched surface of a block has made it necessary to devise means for preserving the original block, and to prepare and work from duplicates, which can be renewed when necessary. For this process the original is coated with a film of the finest plumbago (black lead) powder before being placed face to face with a bed of soft fine wax, into which it is pressed. The plumbago prevents adhesion and facilitates the withdrawal of the plate. By melting the wax and depositing it at which is thus obtained is suspended in a galvanic bath of sulphate of copper. On passing a current of electricity through the liquid to the mould, the copper at once begins to deposit itself in metallic form on the face of the wax mould, and in a short while a deposit becomes thick enough, either by itself or when backed up with other metal, to be used as a block in the place of the original. The very fine nature of process blocks, and the necessity of obtaining a sufficient thickness from them, has led to the replacement of the wax-percha instead of wax as the medium for making a mould. It is melted and poured in a liquid state upon the block, and when cold can be removed without damage. A very long time ago it was found in apt to give way in the course of the separation of the block from the mould. The copper-percha is much more tenacious, and being somewhat flexible, does not break and tear, as wax is liable to do. The whole process requires the greatest care in its manipulation.

Steel-facing is resorted to where long numbers have to be printed from photogravure plates. The finest film of steel is deposited by an electric battery over the whole face of the plate, which is placed in a steel tank. By varying the strength of the current, the rate at which steel is deposited is varied. When the plate is taken from the acid bath, it is clean and highly polished, and is ready for the printing process.

Changes in Machinery. States of America. The vital change in the interest of process block-printing is what is technically known as "mangle". The old, white paper is placed under the form; the "blanket" played an important part in all printing machines. It was a soft woolen sheet, which came between the plate or cylinder and the type and blocks, and modified the force of the contact between them, and, in the line of the pressure, the destination of the force of the press. The process block as compared with the wood engraving, it was found that the blanket was too coarse and soft a material, and that it interfered with the clearness and firmness of the printed result. Blankets of finer material were tried, with improved results; but at last the blanket was entirely superseded by a glazed board, the machinery was more accurately constructed, and the general result was that of a finely-polished steel cylinder, without any intermediate substance between the blank sheet of paper to be printed, was brought in contact with the type and blocks. The old soft blanket kept the cylinder or the flat press, and gave the impression of the type, in spite of the weak construction of much printing machinery. In new machinery, no allowance for such construction; and the new machinery, to meet the new conditions, had to be very perfect in manufacture. Absent a framework with the necessary solidity, which allowed vibration. Modern work demands absolute rigidity in the machine, and a chief characteristic of the best modern printing machinery is strength and solidity, admitting of precision of impression. Another change has been in the nature and treatment of the printing paper. Most elaborate methods were adopted for the moistening of the substance of paper before use. Most paper was printed on whilst damp, but damp paper had to disappear with the soft blanket, and a clay-surfaced or highly-calendered paper was introduced with a glazed face in harmony with the polished steel cylinder which was impressed against the type and blocks. It is essential to apply this paper that it should be dry when used; to ensure the best results with it the paper should be kept some weeks or months before use, so that it may be absolutely dry, or seasoned. If printed on too soon, the clay surface tears away in contact with the "tacky" ink; and instead of the ink being deposited on the paper, bits of the paper surface are left on the forme, and white spots appear in the impression. The bits of paper may be removed so as to deposit the image on the plates under the rollers, and impress black spots on the sheets that come after. New and unseasoned paper accounts for much bad printing, and this form of badness is due to the change in material due to the necessities of modern process work.

3. Planographic processes are such as are printed from a flat surface rather raised above the surrounding ground like a wood engraving or type letter, nor sunk below the ground like an etching or steel engraving. Lithography (q.v.) with its flat stone or plate may be taken as the type.

Woodbury type is a development rather than an invention by Walter Woodbury. By an old nature-printing process leaves and other things which lent themselves to the treatment were by extreme pressure forced into a flat surface of soft metal, and the mould so formed was used as a printing surface to reproduce the forms of the impressed object. Woodbury found that a film of bichromated gelatin exposed to the action of light under a negative and the unaffected parts washed away gave him a relief image which was so hardened by the action of light aided by other hardening agents, that it could with no injury to the film itself—which could be used many times to make fresh moulds—be forced by hydraulic pressure into a thin flat plate of lead or copper, and that the mould so formed could be used in a similar way to the mould formed in the old nature printing process. But a Woodbury type print is rather a cast from the shallow mould than a print in the true sense. It is obtained by filling the mould with a warm solution of coloured gelatin and pressing on it a piece of hard surfaced paper. The pressure forces the solution away from the highest parts of the mould which come in actual contact with the paper, so that none of it is left between them and the surface of the paper which in these parts remains uncoloured. These are the high lights of the print. The pressure forces the colouring matter into the hollows of the mould, and this amount is graduated according to the depth of the hollows. The coloured gelatin gradually cools and hardens and adheres to the paper which on its removal from the mould retains the exact image of the cast. The height given by light and shade is the result of the varying depth of the hollows and the consequent variation of the amount of colouring matter taken up by the impressed paper. The white paper is an important element in the result, the light reflected from it through this coloured gelatin varying according to the thickness of the gelatin film. A drawback to the use of the Woodbury type for book illustration is that every print has to be trimmed and mounted, and of course it cannot be printed with type.

Skannotype is a variation upon Woodbury type. It is an attempt to do away with the need of the hydraulic press for the making of the mould. A film of bichromated gelatin is exposed to the action of light under a positive instead of a negative and the exposed parts washed away. The result is obtained corresponding exactly to that obtained in metal by pressure from a film exposed to light under a negative. This mould was covered by a coating of tin foil to give it the necessary metal surface, and good results were obtained from it, but for some reason it has never come much into use.

Collotype or phototype is a process in which the film of glass, gelatin or gum, treated with bichromate of potash with the addition of alum or some other hardening substance, becomes an actual printing surface inked with an ordinary roller and printed by an ordinary machine. A strong tough film made up of a first coating of a simple gelatinous nature covered by a second film of the sensitive bichromated gelatin is spread upon glass and allowed to dry. Exposed to light under a reversed negative
PROCESS—PROCESSION

the unprotected parts are hardened in proportion to the amount of protection they receive from the negative. After exposure under the negative the back of the film is exposed to the action of sunlight through the glass at its back, so that the whole film may be rendered as hard and tough and durable as possible to stand the wear and tear of the process of printing. When in its place in the printing press the film must be kept moistened. The soft parts unacted upon by the light, but from which the bichromate has been since washed, will absorb moisture in proportion to the action the light has exercised upon it, the absolutely hard parts refusing moisture altogether. The film may now be inked with an ordinary inking roller, the ink being freely taken up by the hard and unmoistened passages and by the partly hardened in proportion to the amount of moisture they are capable of absorbing; as in lithography, the constant moistening of the printing surface is a necessity. Collotype is largely used for postcards. It may be printed in a lithographic or ordinary vertical press of the letterpress printer. Admirable colour results are obtained by this process.

Heliotype is a variation of the method of producing the film which is first spread as described upon waxed glass and then stripped from the glass when dry. After hardening the back of the film it is laid down upon a metal plate and firmly secured to it by the use of an india-rubber cement. It is remarkable the admirable results that are obtainable by so delicate a process. The films have not a long life; a few hundreds only can be printed from each, but the renewal of the film is a simple matter. The result is very like a photograph. The use of heliotype is, however, practically obsolete.

Photolithography.—Zinc or aluminium plates are now frequently used instead of the more cumbersome stones for all so-called lithographic printing. These plates have the same affinity for fat ink as stone, the method of dealing with them being practically the same as with stones, and the description may be taken as applying to both. The stone itself may be rendered sensitive by coating it with a thin film of bichromated gelatin, exposing it under a reversed negative of the required subject and treating the hardened film as it is treated in the case of collotype. A better plan is to render sensitive a sheet of unsized or transfer paper which is exposed under a negative, moistened, and rolled with transfer ink, which is of a specially fatty nature, and adheres only to the parts hardened by exposure which are unaffected by the moistening and remain dry. This inked sheet is laid upon the stone and the two together are subjected to great pressure, passing through a lithographic press. After further moistening the sheet of transfer paper is peeled off, the stone leaving the inked drawing behind it. The usual methods of lithography are then followed, the stone is treated with a preparation of acid and gum, kept moist and printed from in the ordinary lithographic method. Lithography of all kinds can only deal with lines or solid blocks. Tints present difficulties which are best dealt with by other methods of reproduction, but attempts have been made to obtain tints lithographically by breaking up the solid surfaces of the gelatin print with a grain before rolling it with ink and transferring it to the stone.

One of the most successful of such attempts is known as the Ink Photo process, which is more or less of a secret process worked by Messrs Sprague. None of them, however, yield so sound a result as a good drawing made in line, as the grain has a tendency to fill up. Transfers may also be made on to zinc plates which will take the lithographic ink equally well with stones. The plates may be etched—as the inked surfaces resist the action of acid—and by this means a relief plate made, which when mounted on a block, type-high, may be printed typographically. It is known in this form as zinkography.

PROCESS, in law, in the widest sense of the word, any means by which a court of justice gives effect to its authority. In the old practice of the English common law courts process was either original or judicial. Original process was a means of compelling a defendant to compliance with an original writ (see Writ). Judicial process was any compulsory proceeding rendered necessary after the appearance of the defendant. Process was also divided in civil matters into original, mesne and final. Original process in this sense was any means taken to compel the appearance of the defendant. A writ of summons is now the universal means in the High Court of Justice. Mesne process was the proceeding against the defendant taken between the beginning and the end of the action, such as to compel him to give bail, or was directed to persons not parties to the action, such as jurors or witnesses. Arrest on mesne process was abolished in England by the Debtors Act 1869. Final process is practically coexistent with execution. In criminal matters process only applies where the defendant does not appear upon summons or otherwise. A warrant is now the usual form of such process.

Stet processus was a technical term used in old common law practice. It consisted of an entry on the record by consent of the parties for a stay of proceedings. Since the Judicature Acts there has been no record, and the stet processus has disappeared with it.

In Scots law process is used in a much wider sense, almost equivalent to practice or procedure in English law. When papers forming steps of a process are borrowed and not returned to the court of the body, the process may be enforced by execution (attachment). The Scottish process is very much akin to the French dossier.

In the United States process is governed by numerous statutes, both of Congress and of the state legislatures. The law is founded upon the English common law.

PROCESSION1 (M. Eng., processio, Fr., procession, Lat., processio, pro, forward; advance, proceed), in general, an organized body of people advancing in a formal or ceremonial manner. This definition covers a wide variety of such progresses: the medieval pageants, of which the Lord

1 In classical Latin the word generally used for a procession was pompae, a formal march or festivity with a particular spot, to celebrate some event, or for some public or religious purpose. Processio is used by Cicero in the sense of "a marching forward, an advance," any public progress, such as the formal entrance of the consul upon his office (Du Cange, s.v. Procesito), or the public appearance of the emperor. In Late Latin processio is generally used of a religious procession, the word having come to be used of the body of persons advancing or proceeding.
procession

Mayor's show in London is the most conspicuous survival; the processions connected with royal coronations and with court ceremonies generally; the processions of friendly societies, so popular in Great Britain and America; processions organized as a demonstration of political or other opinions; processions forming part of the ceremonies of public worship. In a narrower sense of "going forth, proceeding," the term is used in the technical language of theology in the phrase "Procession of the Holy Ghost," expressing the relation of the Third Person in the Triune Godhead to the Father and the Son.

Processions have in all peoples and at all times been a natural form of public celebration, as forming an orderly and impressive display in which a number of persons can take part in some ceremony. They are included in the celebrations of many religions, and in many countries, both in the East and West, they accompany such events as weddings and funerals. Religious and triumphal processions are abundantly illustrated by ancient monuments, e.g., the religious processions of Egypt, those illustrated by the rock-carvings of Boghaz-Keui (see Prexia), the many representations of processions in Greek art, culminating in the great Panathenian procession of the Parthenon frieze, and Roman triumphal reliefs, such as those of the arch of Titus.

Processions played a prominent part in the great festivals of Greece, where they were always religious in character. The games were either opened or accompanied by more or less elaborate processions and sacrifices, while processions from the earliest times formed part of the worship of the old nature gods (e.g. those connected with the cult of Dionysus, &c.), and later formed an essential part of the celebration of the great religious festivals (e.g. the processions of the Thesmophoria, and that of the Great Dionysia), and of the mysteries (e.g. the great procession from Athens to Eleusis, in connexion with the Eleusinia).

Of the Roman processions, the most prominent was that of the Triumph, which had its origin in the return of the victorious army headed by the general, who proceeded in great pomp from the Campus to the Capitol to offer sacrifice, accompanied by the army, captives, spoils, the chief magistrate, priests bearing the images of the gods, amidst scattering of flowers, burning incense and the like (Ovid, Trist. iv. 2, 3 and 6). Connected with the triumph was the pompa circensis, or solemn procession which preceded the games in the circus; it first came into use at the ludi romani, when the games were preceded by a great procession from the Capitol to the Circus. The praetor or consul who appeared in the pompa circensis wore the robes of a triumphing general (see Mommsen, Staatsrecht i. 397 for the connexion of the triumph with the ludi). Thus, when it became customary for the consul to celebrate games at the opening of the consular year, he came, under the empire, to appear in triumphal robes in the processus consularis, or procession of the consul to the Capitol to sacrifice to Jupiter. After the establishment of Christianity, the consular processions in Constantinople retained their religious character, now proceeding to St Sophia, where prayers and offerings were made; but in Rome, where Christianity was not so widely spread among the upper classes, the tendency was to convert the procession into a purely civil function, omitting the pagan rites and prayers without substituting Christian ones (Dahremerg and Saglio, s.v. "Consul").

Besides these public processions, there were others connected with the primitive worship of the country people, which remained unchanged, and were later to influence the worship of the Christian Church. Such were those of the Ambarvalia, Robigalia, &c., which were essentially rustic festivals, illustrations of the fields, consisting in a procession round the spot to be purified, leading the sacrificial victims with prayers, hymns and ceremonies, in order to protect the young crops from evil influences.

(See Preller, Röm. Mythologie, pp. 370-372.)

As to the antiquity of processions as part of the ritual of the Christian Church, there is no absolute proof of their existence before the 4th century, but as we know that in the catacombs stations were held at the tombs of the martyrs on the anniversary of their death, for the celebration of the eucharist, it is quite probable that the faithful proceeded to the appointed spot in some kind of procession, though there is no satisfactory evidence that this was the case. There are, indeed, early instances of the use of the word "processio" by the Christian writers, but it does not in any case appear to have the modern meaning "procession," as Tertullian (2nd century) uses processio and procedere in the sense of "to go out, appear in public," and, as applied to a church function, "processio" was first used in the same way as collecta, as the equivalent of the Greek συναγωγή, i.e. for the assembly of the people in the church (Du Cange, s.w.). In this sense it appears to be used by Pope Leo I. (Ep. 119. ad Dioec. episc. c. 445; "qui nostris processionibus et ordinatisationibus frequenter interfuit"), while in the version by Dionysius Exiguus of the 17th canon of the Council of Laodicea συναγωγή, is translated by procissibustis (Smith, Dict. of Chr. Antiq. s.v. "Procession"). For the processions that formed part of the ritual of the eucharist, those of the introit, the gospel and the oblation, the earliest records date from the 6th century and even later (see Duchesne, Origines, 2nd ed., pp. 77, 154, 161; 78, 194), but they were not well established at a much earlier date. As to public processions, these seem to have come into rapid vogue after the recognition of Christianity as the religion of the empire. Those at Jerusalem would seem to have been long established when described by the authoress of the Peregrinatio Silviae towards the end of the 4th century (see PASL. SUNDAY, for the procession of palms).

Very early were the processions accompanied by hymns and prayers, known as litanies (Gr. λιτανεία, from λιθοί, prayer, rogationes or supplications (see Litany). It is made to such a procession that reference appears to be made in a letter² of St Basil (c. 375), which would thus be the first recorded mention of a public Christian procession. The first mention for the Western Church occurs in St Ambrose (c. 388, Ep. 40 § 16, Ad Theodos. "monachos ... qui ... psalmae cantem ex consuetudine usque vetei pergebant ad celebratatem Machabaeorum martyrum"). In both these cases the litanies are stated to have been long in use. There is also a procession of a procession accompanied by hymns, organized at Constantinople by St John Chrysostom (c. 390-400) in opposition to a procession of Arians, in Sozomen, Hist. eccl. viii. 8. ³ In times of calamity litanies were held, in which the people walked in rows of penitence, fasting, barefooted, and, in later times, frequently dressed in black (litanii nigræ). The cross was carried at the head of the procession and often the gospel and the relics of the saint were carried. Gregory of Tours gives numerous instances of such litanies in time of calamity; thus he describes (Vita S. Remigii. 1) a procession of the clergy and people round the city, in which relics of St Remigius were carried and litanies chanted in order to avert the plague. So, too, Gregory the Great (Ep. xi. 57) writes to the Sicilian bishops to hold processions in order to prevent a threatened invasion of Sicily. A famous instance of these penitential litanies is the litanio septiformis ordered by Gregory the Great in the year 590, when Rome had been inundated and pestilence had followed.

² De praecet. adv. haer. C. xiiii. "ubi metus in Deum, ibi gravitas honesta ... et subiectio religiosa, et apparitio devota, et processio modesta, et Ecclesia unita et Dei omnia," where it would seem that it may also be translated "also De cultu foem. ii. xi., "Vobis autem nulla procedendae causa tertia; aut imbecillis aliquis ex fratribus visitandus, aut sacrificium offertur, aut Dei verbum administratur," which shows that procedere was not used in the sense of "going to church." The passage ad urarem, il. 4, which is sometimes quoted to prove the existence of processions at this date, appears to use procedere in the same way as the above passages: "... si procederunt eum, nuncquam magis famulis occupatio obvenit. Quis enim sit conjugem sanctam vel in corpore gratia patientem? Quas ille religiosos, qui pro se quaeque turgia curatur; quibus dieqen solemnibus Paschae aboctantem securus sustinebit?" ² Ep. 207 ad Nescius: "Αλλ' άν οὗ δρα νυν, γαίη τοῦ μναχοῦ Γρηγορίου. 'Αλλ' άνα τα λιτανεία, ας δεικνυν ειρήνηες κ. τ. λ.

³ Brawlings have arisen with the Catholics, who began singing their hymns in opposition, the emperor prohibited the Ariamian meetings.
In this litany seven processions, of clergy, laymen, monks, nuns, matrons, the poor, and children respectively, starting from seven different churches, proceeding to hear mass at Sta Maria Maggiore (see Greg. of Tours, Hist. Fr. x.1, and Johann. Diacon. Vita Greg. Magn. i. 42). This litany has often been confused with the litanies majores, introduced at Rome in 508 (vide supra), but is quite distinct from it.1

Funeral processions, accompanied with singing and the carrying of lighted tapers, were very early customary (see Light, CEREMONIAL USE OF), and akin to these, also very early, were the processions connected with the translation of the relics of martyrs from their original burying place to the church where they were to be enshrined (see e.g. St Ambrose, Ep. 29 and St Augustine, De civitate Dei, xxii. 8 and Conf. viii. 7, for the finding and translation of the relics of Saints Gervasius and Protasius). From the time of the emperor Constantine I. these processions were of great magnificence.2

Some liturgists maintain that the early Church in its processions followed Old Testament precedents, quoting such cases as the procession of the ark round the walls of Jericho (Josh. vi.), the procession of David with the ark (2 Sam. vi.), the processions of thanksgiving on the return from captivity, etc. The liturgy of the early Church as Duchesne shows (Origines, ch. i.) was influenced by that of the Jewish synagogue, but the theory that the Church adopted the Old Testament ritual is of quite late growth. What is certain is that certain festivals involving processions were adopted by the Christian Church from the pagan calendar of Rome. Here we need only mention the litaniae majores et minores, which are stated by Usser ("Alte Bittgänge" in Zeller, Philosophische Aufsätze, p. 378 seq.) to have been first instituted by Pope Liberius (352-366). It is generally acknowledged that they are the equivalent of the Christian Church of the Roman lustrations of the crops in spring, the Ambassadia, etc. The litania major, or great procession on St Mark's day (April 25) is shown to coincide both in date and ritual with the Roman Robigalia, which took place a.d. vii. Kal. Mai., and consisted in a procession leaving Rome by the Flaminian gate, and proceeding by way of the Mivian bridge to a sanctuary at the 5th milestone of the Via Claudia, where the flamen quirinalis sacrificed a dog and a sheep to avert blight (robius) from the crops (Fasti praenestini, C. L. L., p. 317). The litania major followed the same route as far as the Mivian bridge, when it turned to the left along the Via Appia. This was the way in which the litanies took place before 1200. This was already established as an annual festival by 598, as is shown by a document of Gregory the Great (Regist. ii.) which inculcates the duty of celebrating litanies, quae major ab omnibus appellatur. The litaniae minores or rogations, held on the three days preceding Ascension Day, were first introduced into Gaul by Bishop Mamertus of Vienne (c. 470), and made binding for all Gaul by the 1st Council of Orleans (511). The litaniae minores were also adopted for these three days in Rome by Leo III. (c. 800). A description of the institution and character of the Ascensiontide rogations is given by Sidonius Apollinaris (Ep. v. 14). "The solemnity of these," he says, "was first established by Mamertus. Hitherto they had been erratic, lukewarm and poorly attended (saepe tepentes, infrequentes); this was the first time they were performed in solemnity and with psalms and tears." In the Ambrosian rite the rogations take place after Ascensiontide, and in the Spanish on the Thursday to Saturday after Whitusintide, and in November (Synod of Girona, 517).

1 Litanies, owing to the fact that they were sung in procession were in England sometimes themselves called processions. Thus we read in the "Order of making Knights of the Bath for the coronation of Queen Elizabeth": "the parson of the said church knelyng said the procession in Englyshe and all that were there answered the parson" (B. M. Add. MSS. 4712, p. 51, printed in Anaxia's Observations, p. 53).

It is impossible to describe in detail the vast development of processions during the middle ages. The most important and characteristic of these still have a place in the ritual of the Roman Catholic Church. The rules governing them are laid down in the Ritual Romanum (Tit. ix.), and they are classified in the following way:—

(1) Processiones generales, in which the whole body of the clergy takes part. (2) Processiones ordinariae, on yearly festivals, such as the feast of the Purification of the Virgin, Candelmas, q.e., the procession on Palm Sunday (q.e.), the litaniae majores and minores, the feast of Corpus Christi (q.e.), and on other days, according to the custom of the churches. (3) Processiones extraordinariae, such as processions ordered to pray, for rain or fine weather, in time of storm, famine, plague, war, or, in quasunque tribulatione, processions of thanksgiving, translation of relics, the dedication of a church or cemetery. There are also processions of honour, for instance to meet a royal personage, or the bishop on his first entry into his diocese (Pontif. rom. iii.). Those taking part in processions are to walk bare-headed (weather permitting), two and two, in decent costume, and with reverent men; clergy and laity, men and women, are to walk separately. The cross is carried at the head of the procession, and banners embroidered with sacred pictures in places where this is customary; these banners must not be of military or triangular shape. Violet tapers are to be lighted for the procession of Corpus Christi, or on a day when some other colour is prescribed. The officiating priest wears a cope, or at least a surplice with a violet stole, the other priests and clergy wear surplices.

When the host is borne in procession it is covered with a canopy, and accompanied by lights. At the litaniae majores and minores and other penitential processions, joyful hymns are not allowed, but the litanies are sung, and, if the length of the procession is greater than the musical capacity, the clergymen, the laity, and the processional bishops sing. As to the discipline regarding processions the bishop, according to the Council of Trent (Sess. 25 de reg. cap. 6), appoints and regulates processions, and public prayers outside the churches.

The observance or variation in the discipline belongs to the Congregation of Rites; in pontifical processions, which are regulated by the masters of the ceremonies (magistri ceremoniarum pontificum), these points are decided by the chief cardinal deacon. As to processions within the churches, some difference of opinion having arisen as to the regulating authority, the Congregation of Rites has decided that the bishop must ask, though not necessarily follow, the advice of the chapter in their regulation.

Reformed Churches.—The Reformation abolished in all Protestant countries those processions associated with the doctrine of transubstantiation (Corpus Christi); the sacrament of the Lord's Supper," according to the 28th Article of Religion of the Church of England, is to be "administered to the people, by a priest covered about, lifted up, or worshipped." It also abolished those associated with the cult of the Blessed Virgin and the saints. The stern simplicity of Calvinism, indeed, would not tolerate religious processions of any kind, and from the "Reformed" Churches they vanished altogether. The more conservative temper of the Anglican and Lutheran communions, however, suffered the retention of such processions as did not conflict with the reformed doctrines, though even in these Churches they met with opposition and tended after a while to fall into disuse.

The Lutheran practice has varied at different times and in different countries. Thus, according to the Württemberg Kirchenordnung of 1553, a funeral procession was prescribed, the bearers being followed by the congregation singing hymns. The Kurhessische Kirchenordnung (1548) directed the cross-bearer to lead the procession and lighted candles to be carried, and this was prescribed also by the Waldeck Kirchenordnung of 1556. At present funeral processions survive in general only in the country districts; the processional cross or crucifix is still carried. In some provinces also the Lutheran Church has retained the ancient rogation processions in the week before Whitsuntide and, in some cases, in the month of May or on special occasions (e.g. days of humiliation, Bußstage), processions about the fields to ask a blessing on the crops. On these occasions the ancient litanies are still used.

In England "the perambulations of the circuits of the parishes . . . used heretofore in the days of rogations" were ordered to be observed by the Injunctions of Queen Elizabeth in 1559; and for these processions certain "psalms, prayers and homilies"
PROCESSION PATH—PROCLUS

were prescribed. The Puritans, who aimed at setting up the Genevan model, objected; and the visitation articles of the bishops in Charles I.'s time made frequent inquisition into the neglect of the clergy to obey the law in this matter. With "the profane, ungodly, presumptuous multitude" (to quote Baxter's *Saint's Rest*, 1650, pp. 344, 345), however, these "processions and perambulations" appeared to have been very popular, though "only the traditions of their fathers." However this may be, the Commonwealth made an end of them, and they seem never to have been revived; Sparrow, in his *Rationale upon the Book of Common Prayer* (London, 1668), speaks of "the service formerly appointed in the Rogation days of Procession."

Among the processions that survived the Reform in the English Church was that of the sovereign and the Knights of the Garter on St George's day. This was until Charles II.'s time a regular occasion, the choristers in surplices, the gentlemen of the royal chapel in copes, and the canons and other clergy in copes preceding the knights and singing the litany. In 1661, after the Restoration, by order of the sovereign and knights companions in chapter "that supplicational procession" was "converted into a hymn of thanksgiving." Akin to this procession also are the others connected with royal functions; coronations, funerals. These retained, and retain, many pre-Reformation features elsewhere fallen obsolete. Thus at the funeral of George II. (1760) the body was received at the door of the Abbey by the dean and prebendaries in their copes, attended by the choir, all carrying lighted tapers, who preceded it up the church, singing.

The only procession formerly prescribed in the Book of Common Prayer is that in the order of the burial of the dead, where the rubric directs that "the priest and clerks meeting the corpse at the entrance of the churchyard, and going before it, either into the church, or towards the grave, shall say, or sing," certain verses of Scripture. Tapers seem to have been carried, not only at royal funerals, until well into the 18th century (see *Lights, Ceremonial*). Processions, with singing of the litany or of hymns, appear also to have been always usual on such occasions as the consecration of churches and churchyards and the solemn reception of a visiting bishop. Under the influence of the Catholic revival, associated with the Oxford Tractarians, processions have become increasingly popular in the English Church, pre-Reformation usages having in some churches been revived without any legal sanction. The most common forms, however, are the processional litanies, and the solemn entry of clergy and choir into the church, which on festivals is accompanied by the singing of a processional hymn, their entry being often preceded by the procession of the clergy and choir in cope, processional cross, banners, and lights having been largely revived.

**PROCESSION PATH** (Lat. ambitus templi), the route taken by processions on solemn days in large churches—up the north aisle, round behind the high altar, down the south aisle, and then up the centre of the nave.

**PROCESSION** (Fr. process, process, Late Lat. verbalis, from verbum, word), in French law, a detailed authenticated account drawn up by a magistrate, police officer, or other person having authority of acts or proceedings done in the exercise of his duty. In a criminal charge, a procès-verbal is a statement of the facts of the case. The term is also sometimes applied to the written minutes of a meeting or assembly.

**PROCIDA** (Gr. Προκίδη, Lat. *Procida*), an island off the coast of Campania, Italy, 2 m. S.W. of Cape Miseno, and 2 m. N.E. of Ischia on the west side of the Gulf of Naples, and about 12 m. S.W. of Naples. Pop. (1901), of the town, 25,220; of the whole island, one commune, 14,440. It is about 2 m. in length and of varying width, and, reckoning in the adjacent island of Vivara, is made up of four extinct craters, parts of the margins of all of which have been destroyed by the sea. The highest point of it is only 250 ft. above sea-level. It is very fertile, and the population is engaged in the cultivation of vines and fruit and in fishing. Procida, the only town, lies on the east side; its castle is now a prison. It also contains a royal palace. Classical authors explained the name of Procida either as an allusion to its having been detached from Ischia, or as being that of the nurse of Aeneas.

**PROCLAMATION** (Lat. proclamare, to make public by announcement), in English law, a formal announcement (royal proclamation), made under the great seal, of some matter which the king in council desires to make known to his subjects: e.g. the declaration of war, the statement of neutrality, the summoning or dissolution of parliament, or the bringing into operation of the provisions of some statute the enforcement of which the legislature has left to the discretion of the king in council. Royal proclamations of this character, made in furtherance of the executive power of the Crown, are binding on the subject, "where they do not either contradict the old laws or tend to establish new ones, but only confine the execution of such laws as are already in being in such manner as the sovereign shall judge necessary" (Blackstone's *Commentaries*, ed. Stephen, ii. 528; Stephen's *Commentaries*, 14th ed. 1903, ii. 506, 507; Dicey, *Law of the Constitution*, 6th ed., 51). Royal proclamations, although not made in pursuance of the executive powers of the Crown, either call upon the subject to fulfill some duty to which he is by law bound to perform, or to abstain from any acts or conduct already prohibited by law, are lawful and right, and disobedience to them (while not of itself a misdemeanor) is an aggravation of the offence (see charge of Chief Justice Cockburn to the grand jury in *R. v. Eyre* (1867) and Case of Proclamations 1610, 12 Co. Rep. 74). The Crown has from time to time *legislated* by proclamation; and the Statute of Proclamations 1539 provided that proclamations made by the king with the assent of the council should have the force of statute law if they were not prejudicial to "any person's inheritance, offices, liberties, goods, chattels or life." But this enactment was repealed by an act of 1547; and it is certain that a proclamation purporting to be made in the exercise of legislative power by which the sovereign imposes a duty to which the subject is not strictly bound and for which he has not made provision, whether by law or otherwise, is not an offence at law, or adds fresh penalties to any offence, is of no effect unless itself issued in virtue of statutory authority (see also ORDER IN COUNCIL). The Crown has power to *legislate* by proclamation for a newly conquered country (Jenyns, *British Rule and Jurisdiction beyond the Seas*); and this power was freely exercised in the Transvaal Colony during the Boer War of 1899–1902. In the British colonies, ordinances are frequently brought into force by proclamation; certain imperial acts do not take effect in a colony until there proclaimed (e.g. the *Foreign Enlistment Act* 1879); and proclamations are constantly issued in furtherance of executive acts. In many British protectorates the high commissioner or administrator is empowered to legislate by proclamation.

In the old system of real property law in England, fines, levied with subsequent proclamations, i.e. with successive public-announcements of the transaction in open court, barred the rights of strangers, as well as parties, in case they had not made claim to the property conveyed within five years thereafter (acts 1483–1484 and 1488–1490). These proclamations were originally made six times, four times in the term in which the fine was levied, and four times in each of the three succeeding terms. Afterwards the number of proclamations was reduced to one in each of the four terms. The proclamations were endorsed on the back of the record. The system was abolished by the *Fines and Recoveries Act* 1833. (A. W. R.)

**PROCLUS** or *PROCLUS* (A.D. 410–485), the chief representative of the later Neoplatonists, was born at Constantinople, but
PROCOPIUS

brought up at Xanthus in Lycia. Having studied grammar under Orion and philosophy under Olympiodorus the Peripatetic, he proceeded to Athens. There he attended the lectures of the Neoplatonists Plutarch and Syrius, and about 450 succeeded the latter in the chair of philosophy (hence his surname Diadochus, which, however, is referred to by others to his being the "successor" of Plato). As an ardent upholder of the old pagan religion Proclus incurred the hatred of the Christians, and was obliged to take refuge in Asia Minor. After a year's absence he returned to Athens, where he remained until his death. His epitaph, written by himself, is to be found in Anthologia palatina, vii. 451. Although possessed of ample means, Proclus led a most temperate, even ascetic life, and employed his wealth in generous relief of the poor. He was supposed to hold communion with the gods, who endowed him with miraculous powers. He acted up to his famous saying that "the philosopher should be the hierophant of the whole world," by celebrating Egyptian and Chaldean as well as Greek festivals, and on certain days performing sacred rites in honour of all the dead.

His literary activity was chiefly devoted to the elucidation of the writings of Plato. There are still extant commentaries on the First Alcibiades, Parmenides, Republic, Timaeus and Cratylus. His views are more fully expounded in the Peri tis kata Platos theologiae (In Platonis theologiam). The Stoicheia theologicia (Institutio theologica) contains a compendious account of the principles of Neoplatonism and the modifications introduced in it by Proclus himself. The pseudo-Aristotelian De causis is an Arabic extract from this work, ascribed to Alfarabius (d. 950), circulated in the west by means of a Latin translation (ed. O. Bardenhewer, Freiburg, 1882). It was answered by the Christian rhetorician Procopius of Gaza in a treatise which was deliberately appropriated without acknowledgment by Nicolaus of Methone, a Byzantine theologian of the 12th century (see W. Christ, Gesch. der griechischen Literatur, 1898, § 692). Other philosophical works by Proclus are Stoicheia physikè, Peri nephrokata (Institutio physica sive De motu), a compendium of the last five books of Aristotle's Peri nephros (On dynamics), De physica auscultatione, and De providentia et fato, Decem abhijestiones circa providentiam, De malarum substantiensa, known only by the Latin translation of William of Moerbeke (archbishop of Corinth, 1277-1281), who also translated the Stoicheia theologike into Latin. In addition to the epitaph already mentioned, Proclus was the author of hymns, seven of which have been preserved (to Helios, Aphrodite, the Muses; the Gods, the Lycian Aphrodite, Hecate and Janus, and Athena), and of an epigram in the Greek Anthology (Anth. pal. iii. 3, 166 in Didot edition.) His astronomical and mathematical writings include 'Iatousiakon tōn astronómikon óeðéounon (Hyporrhysis astronomicae positionum, ed. C. Manitius, Leipzig, 1909); Peri óeðéa (De sphaira); Paráfrasseis eis t' n Ptolemeiou teurábíon, a paraphrase of the difficult passages in Ptolemy's astrological work Tetrabíblos; Ei t' prákton tōn Eukleidou stoicheiów, a commentary on the first book of Euclid's Elements; a short treatise on the effect of eclipses (De effectibus eclipsium, only in a Latin translation). The first circles of the Charac Coca were a commentary on the Works and Days of Hesiod (incomplete); some scholia on Homer, one elementary treatise on the epistolary style, Peri epistolikou charaktoión (Characteres epistolici), attributed in some MSS. to Libanius. The Sphragismoi grammatici by a Proclus, who is identified by Suidas with the Neoplatonist, is probably the work of a grammarian of the 2nd or 3rd century, though Wilmot-Mollendorff (Philolog. Untersuch. vii.; supported by O. Immisch in Festschrift Th. Comper, pp. 237-274) agrees with Suidas. According to Suidas, he was also the author of 'Epigraphismoi eis t' katan Xristianow (Animadversiones duodecimatis in christianos). This work, identified by W. Christ with the Institutio theologica, was answered by Joannes Philoponus (7th century) in his De aeternitate mundi. Some of his commentary on the Chaldaean oracles (Aúga Xaldaikha) has been discovered in modern times.

There is no complete edition of the works of Proclus. The selection of V. Cousin (Paris, 1864) contains the treatises De providentia et fato, Decem abhijestiones, and De malarum substantiensa, the commentaries on the Alcibiades and Parmenides. The Institutio theologica, published in 1877, is a later edition of Proclus (Paris, 1855); the In Platonis theologiam has not been reprinted since 1818, when it was published by Aemilius Portus with a Latin translation. Most recent editions of individual works or collections of commentaries are:

Proclus, in: Scholia in Platonem, ed. A. E. Chaligian (1900-1903); Republic, by W. Kroll (1890-1901); Timaeus, by E. Diehl (1903-1905); Hymns, by J. Abel (1895) and A. Ludwich (1895); commentary on Euclid by G. Friedlein (1875); Αύγα Χαλδαίκα, by J. A. Hahn (1911); Christian epistolae, by W. Blumenstein (1868); Scholia to Hesiod in E. Vollrnuth's edition (1844). Thomas Taylor, the "Platonic," translated the commentaries on the Timaeus and Euclid, The Theology of Plato, The Elements of Theology, and the three Latin treatises.

On Proclus generally and his works see article in Suda, Marinos, Vita Procli, J. A. Fabricius, Bibliotheca græca (ed. Harl. 1898), 363-445; W. Christ, Geschichte der griechischen Literatur (1898), § 623; E. S. Sandy, Hist. of Classical Scholarship (1906); 1, 372; The Later Roman Empire (1895), i. 3, 174; Proclus is styled the "Hegel of Neoplatonism"; on his philosophy, T. Whittaker, The Neo-Platonists (1901), and Neoplatonism.

Extracts from the Περι πολιτείας are preserved in Photios (Cod. 223), and are the only source of information regarding the treatise. On the question of authorship, see Christ § 637, and Sandy, p. 379; also D. B. Monro's appendix to his ed. of Homer's Odyssey, xiii-xxiv. (1901).

PROCOPIUS, Byzantine historian, was born at Caesarea in Palestine towards the end of the 5th century A.D. He became a lawyer, probably at Constantinople, and was in 527 appointed secretary and legal adviser to Belisarius, who was proceeding to command the imperial army in the war against the Persians (De bello persico i. 12). When the Persian War was suspended and Belisarius was despatched against the Vandals of Africa in 533, Procopius again accompanied him, as he subsequently did in the war against the Ostrogoths of Italy, which began in 535. After the capture of Ravenna in 540 Procopius seems to have returned to Constantinople, since he minutely describes the great plague of 542 (op. cit. ii. 22). It does not appear whether he was with the Roman armies in the later stages of the Gothic War, when Belisarius and afterwards Narses fought against Totila in Italy; his narrative of these years is much less full and minute than that of the earlier warfare. Of his subsequent fortunes we know nothing, except that he was living in 559. Whether he was the Procopius who was prefect of Constantinople in 562 (Theophanes, Chronographia, 201, 202), and was removed from office in the year following, cannot be determined. As the historian was evidently a person of note, who had obtained the rank of illustrius (Suidas), and from a passage in the Anecdota (12) seems to have risen to be a senator, there is no improbability in his having been raised to the high office of prefect.

Procopius's writings fall into three divisions: the Histories (Persian, Vandal and Gothic Wars), in eight books; the treatise on the Buildings of Justinian (De aedificiis), in six books; and the Unpublished Memoirs (Avkistoria, Historia arcana), so called because they were not published during the lifetime of the author.

The Histories are called by the author himself the Books about the Wars (O Ídei tou polémou hýmou). They consist of: (1) the Persian Wars, in two books, giving a narrative of the long struggle between Persia and Justinian, in which the king of Persia, Chosroes, was defeated and captured at the Battle of Vahvdh and in the Vandal kingdom in Africa and the subsequent events there from 532 down to 546 (with a few words on later occurrences); (2) the Gothic War, in three books, narrating the war against the Ostrogoths in Sicily and Italy from 536 till 552. The eighth book contains a further summary of events down to 554. These eight books of Histories, although mainly occupied with military matters, contain notices of some of the more important domestic events, such as the Nika insurrection at Constantinople in 532, the plague in 542, the conspiracy of Artabemes in 548. They tell us, however, comparatively little about the civil administration of the empire, and nothing about legislation. On the other hand they are rich in geographical and ethnographical information.
PROCOPIUS OF GAZA—PROCTOR, B. W.

As an historian Procopius is of quite unusual merit, when the generally low literary level of his age is considered. He is industrious in collecting facts, careful and impartial in stating them; his judgment is sound, his reflections generally acute, his conceptions of the general march and movement of things not unworthy of the great events he has recorded. His descriptions, particularly of military operations, are clear, and his special fondness for this part of the subject seldom leads him into unnecessary minuteness. The style, although marked by mannerisms, by occasional affectations and rhetorical devices, is on the whole direct and businesslike, nor is the Greek bad for the period in which he wrote. His models are Thucydides and Herodotus. The former he imitates in the maxims (γρώμα) he throws in and the speeches which he puts into the mouth of the chief actors; the latter in his frequent geographical digressions, in the personal anecdotes, in the tendency to collect and attach some credence to marvellous tales. The speeches are obviously composed by Procopius himself, rarely showing any dramatic variety in their language, but they seem sometimes to convey the substance of what was said; and even when this is not the case they frequently serve to bring out the points of a critical situation. Procopius is almost as much a geographer as an historian, and his descriptions of the people and places he himself visited are generally careful and thorough. Although a warmly patriotic Roman, he does full justice to the merits of the barbarian enemies of the empire, particularly the Ostrogoths; although the subject of a despotic prince, he criticizes the civil and military administration of Justinian and his dealings with foreign peoples with a freedom which gives a favourable impression of the tolerance of the emperor. His chief defects are a somewhat pretentious and at the same time monotonous style, and a want of sympathy and intensity.

The De aedificiis contains an account of the chief public works executed during the reign of Justinian down to 558 (in which year it seems to have been composed), particularly churches, palaces, hospitals, fortresses, roads, bridges and other river works throughout the empire. All these are of course ascribed to the personal action of the monarch. If not written at the command of Justinian (as some have supposed), it is evidently grounded on official information, and is full of gross flattery of the emperor and of the (then deceased) empress. In point of style it is generally inferior to the Histories—florid, pompous and affected, and at the same time tedious. Its chief value lies in the geographical notices which it contains.

The Anecdota ("Secret History") purports to be a supplement to the Histories, containing explanations and additions which the author could not insert in the latter work for fear of Justinian and Theodora. It is a curious invective against these sovereigns, their characters, personal conduct and government, with attacks on Belisarius and his wife Antonina, and on other noted officials in the civil and military services of the empire. Owing to the ferocity and brutality of the attacks upon Justinian, the authenticity of the Anecdota has often been called in question, but the claims of Procopius to the authorship are now generally recognized. In point of style, the Anecdota is inferior to the Histories, and has the air of being unfinished, or at least unrevised. Its merit lies in the furious earnestness with which it is written, which gives it a force and reality sometimes wanting in the more elaborate books written for publication. The history of Philip of Macedon by Theopompos probably furnished the author with a model.

The best complete edition of Procopius is by J. Haury (Teubner Series, 1905); the Gothic War has been edited by D. Compagni (1866); the English translation of the History of the Wars, by H. Holcroft (1853); of the Anecdota (1674, anonymous); of the Buildings, by Aubrey Stewart (1888, in Palestine Pilgrimage, Text Society); Chief authorities for Procopius are Césarea (1865); W. S. Teuffel in Studien und Charakteristiken (2nd ed., 1889); L. Ranke, Weltgeschichte (1883), iv. 2. On the genuineness of the Anecdota cf. J. B. Bury (who agrees with Ranke in rejecting the authorship of Procopius) A History of the Later Roman Empire (1887) and introd. to vol. i. (p. 57) and appo. to vol. iv. of his edition of Gibbon's Decline and Fall. For the literature of the subject generally, see C. Krumbacher, Geschichte der byzantinischen Literatur (2nd ed., 1897).

PROCOPIUS OF GAZA (c. 465–528 A.D.), Christian sophist and rhetorician, one of the most important representatives of the famous school of his native place. Here he spent nearly the whole of his life teaching and writing, and took no part in the theological movements of his time. The little that is known of him is to be found in his letters and the eikonomy by his pupil and successor Choricius. He was the author of numerous rhetorical and theological works. Of the former, his panegyric of the emperor Anastasius alone is extant; the description of the epoch of Sapor II. and the monody on its partial destruction by an earthquake are spurious. His letters (162 in number), addressed to persons of rank, friends, and literary opponents, throw valuable light upon the condition of the sophistical rhetoric of the period and the character of the writer. The fragment of a polemical treatise against the Neoplatonist Proclus is now assigned to Nicolaoz, archbishop of Methone in Pelo- nnesus (fl. 12th century). Procopius's theological writings consist of commentaries on the Octateuch, the books of Kings and Chronicles, Isaiah, the Proverbs, the Song of Songs and Ecclesiastes. They are amongst the earliest examples of the "catenic" (catena, chain) form of commentary, consisting of a series of extracts from the fathers, arranged, with independent additions, to elucidate the portions of Scripture concerned. Photius (c. 1069), while blaming the dullness of these commentaries, praises the writer's learning and style, which, however, he considers too ornate for the purpose.

Complete editions of the works of Procopius in Migne, Patrologia graeca, lxxxvi; the letters also in Epistolographi graeci, ed. R. Hercher (1873); see also K. Seitz, Die Schule von Gaza (1892); D. Russo, Teise Paques (Constantinople, 1831); L. Eisenhofer, Procopius von Gaza (1897); further bibliographical notices in C. Krumbacher, Geschichte der byzantinischen Literatur (1897), and article by G. Krüger in Herzog-Hauck's Realencyclopaedie für protestantische Theologie (1905).

PROCRUSTES (Gr. for "the stretcher"), also called Poly- pemon or Damastes, in Greek legend, a robber dwelling in the neighbourhood of Eleusis, who was slain by Theseus. He had two bedsteads (according to some, only one), the one very long, the other very short. When a stranger claimed his hospitality, Procrustes compelled him, if he was tall, to lie down on the short bed, and then cut off his extremities to make him fit. If on the other hand he was short, he was placed on the long bed, and his limbs cut off until he died from exhaustion. The "bed of Procrustes" has become proverbial.

Diad. Sic. iv. 99; Hyginus, fab. 38: Plutarch, Theseus, 111; Pausanias i. 38, 5.

PROCTOR, BRYAN WALLER (1787–1874), English poet, was born at Leeds on the 21st of November 1787. He was educated at Harrow, where he had for contemporaries Lord Byron and Sir Robert Peel. On leaving school he was placed in the office of a solicitor at Calne, Wiltshire, remaining there until about 1807, when he returned to London to study law. By the death of his father in 1816 he became possessed of a small property, and soon after entered into partnership with a solicitor; but in 1820 the partnership was dissolved, and he began to write under the pseudonym of "Barry Cornwall." After his marriage in 1824 to Miss Skepper, a daughter of Mrs Basil Montague, he returned to his professional work as conveyancer, and was called to the bar in 1831. In the following year he was appointed, metropolitan commissioner of lunacy—an appointment annually renewed until his election to the permanent commission constituted by the act of 1843. He resigned office in 1861. He died on the 5th of October 1874. Most of his verses was composed between 1815, when he began to contribute to the Literary Gazette, and 1833, or at latest 1832.

His principal poetical works were: Dramatic Scenes and other Poems (1810), A Sicilian Story (1820), Mirandola, a tragedy performed at Covent Garden with Macready, Charles Kemble and Miss Foote in the leading parts (1821), The Flood of Thessaly (1823), and English Songs (1832). He was also the author of
Effigies poeticae (1824), Life of Edmund Kean (1835), Essays and Tales (1851), Charles Lamb: a Memoir (1860), and of memoirs of Ben Jonson and Shakespeare for editions of the works. A posthumous autobiographical fragment with notes of his literary friends, of whom he had a wide range from Bowles to Browning, was published in 1877, with some additions by Coventry Patmore. Charles Lamb gave the highest possible praise to his friend's Dramatic Sketches when he said that had he found them as anonymous manuscript in the Garrick collection he would have had no hesitation about including them in his Dramatic Specimens. He was perhaps not an impartial critic. "Barry Cornwall's" genius cannot be said to have been entirely mimic, but his works are full of subdued echoes. His songs have caught some notes from the Elizabethan and Cavalier lyrics, and blended them with others from the leading poets of his own time; and his dramatic fragments show a similar infusion of the early Victorian spirit into pre-Restoration forms and cadences. The results are somewhat heterogeneous, and lack the impress of a pervading and dominant personality to give them unity, but they abound in pleasant touches, with here and there the flash of a higher, though casual, inspiration.

His daughter, Adelaide Anne Proctor (1825-1864), also a poet, was born on the 30th of October 1825. She began to contribute to Household Words in 1853. She adopted the name of "Mary Berwick," so that the editor, Charles Dickens, should not be prejudiced by his friendship for the Proctors. Her principal work is Legends and Lyrics, of which a first series, published in 1858, ran through nine editions in seven years, while a second series issued in 1860 met with a similar success. Her unambitious verses dealing with simple emotional themes in a simple manner have a charm which is scarcely explicable on the ground of high literary merit, but which is due rather to the fact that they are the cultured expression of an earnest and beneficent life. Among the best known of her poems are The Angel's Story, The Legend of Bregenz and The Legend of Provence. Many of her songs have since been set to music, and songs and hymns of her composition are still sung in Catholic and Protestant churches, and in Roman Catholicism, and her philanthropic zeal appears to have hastened her death, which took place on the 2nd of February 1864.

Proctor, Alexander Phimister (1862-189), American sculptor and painter, was born in Ontario, Canada, on the 27th of September 1862. As a youth he lived at Denver, Colorado, spending much of his time in the Rocky Mountains, and his familiarity with the ways and habits of wild animals was supplemented later by study in the Jardin des Plantes, Paris. He was a pupil at the National Academy of Design and later in the Art Students' League, in New York, and first attracted attention by his statues of wild animals at the Columbian Exposition, Chicago. In 1896 he won the Rinehart Scholarship, which enabled him to spend five years in Paris, where he studied under Puech and J. A. Injalbert. Among his works of sculpture are: "Indian Warrior" (a small bronze); "Panthers," Prospect Park, Brooklyn, New York; "Quetzaro," for United States Pavilion, Paris Exhibition (1900), and groups in the City Park, Denver, and Zoological Park, New York. His pictures of wild animals, mainly in water colours, are also characteristic. He became a member of the Society of American Artists (1893), of the National Academy of Design (1904), of the American Water Color Society, and of the Architectural League, New York.

Proctor, Richard Anthony (1837-1888), British astronomer, was born at Chelsea on the 23rd of March 1837. He was a delicate child, and, his father dying in 1836, his mother attended herself to his education. On his health improving he was sent to King's College, London, from which he obtained a scholarship at St John's College, Cambridge. He graduated in 1860 as 23rd wrangler. His marriage while still an undergraduate probably accounted for his low place in the tripos. He then took up the law in the Inner Temple, but turned to astronomy and authorship instead, and in 1863 published an article on the "Colours of Double Stars" in the Cornhill Magazine. His first book—Saturn and his System—was published in the same year, at his own expense. This work contains an elaborate account of the phenomena presented by the planet; but although favourably received by astronomers, it had no great sale. He intended to follow it up with similar treatises on Mars, Jupiter, sun, moon, comets and meteors, stars, and nebulae, and had in fact commenced a monograph on Mars, when the failure of a New Zealand bank deprived him of an independence which would have enabled him to carry out his scheme without anxiety as to its commercial success or failure. Being thus obliged to depend upon his writings, the support of his family, and having learned by the fate of his Saturn that the general public are not attracted by works requiring arduous study, he cultivated a more popular style. He wrote for a number of periodicals; and although he has stated that he would at this time willingly have "turned to stone-breaking on the roads, or any other form of hard and honest but unscientific labour, if a modest competence had been offered" him in any such direction, he attained a high degree of popularity, and his numerous works had a wide influence in familiarizing the public with the main facts of astronomy. His earlier efforts were, however, not always successful. His Handbook of the Stars (1866) was refused by Messrs Longmans and Messrs Macmillan, but being privately printed, it sold fairly well. For his Half-Hours with the Telescope (1868), which eventually reached a 20th edition, he received originally £25 from Messrs Hardwic. Although teaching was uncongenial to him he took pupils in mathematics, and held for a time the position of mathematical coach for Woolwich and Sandhurst.

His literary standing meantime improved, and he became a regular contributor to The Intellectual Observer, Chambers's Journal and the Popular Science Review. In 1870 appeared his Other Worlds than Ours, in which he discussed the question of the plurality of worlds in the light of new facts. This was followed by a long series of popular treatises in rapid succession, amongst the more important of which are Light Science for Leisure Hours and The Sun (1871); The Birds among Us and Essays on Astronomy (1874); The Exploits of Charles and Louise; The Borderland of Science (1875); The Universe and the Coming Transits and Transits of Venus (1874); Our Place among Infinites (1875); Myths and Marbles of Astronomy (1877); The Universe of Stars (1878); Flowers of the Sky (1879); The Poetry of Astronomy (1880); Easy Star Lessons and Familiar Science Studies (1882); Mysteries of Time and Space and The Great Pyramid (1883); The Universe of Suns (1884); The Seasons (1885); Other Worlds than Ours and Half-Hours with the Stars (1887). In 1881 he founded Knowledge, a popular weekly magazine of science (converted into a monthly in 1885), which had a considerable circulation. In it he wrote on a great variety of subjects, including chess and whist. He was also the author of the articles on astronomy in the American Cyclopaedia and the ninth edition of the Encyclopaedia Britannica, and was well known as a popular lecturer on astronomy in England, America and Australia. Elected a fellow of the Royal Astronomical Society in 1870, he held the office of vice-president from 1872, and contributed eighty-three separate papers to its Monthly Notices. Of these the more noteworthy dealt with the distribution of stars, star-clusters and nebulae, and the construction of the sidereal universe. He was an expert in all that related to map-drawing, and published two star-atlases. A chart on an isographic projection, exhibiting all the stars contained in the Bonn Durchmusterung, was designed to show the laws according to which the stars down to the 9th magnitude are distributed over the northern heavens. His "Theoretical Considerations respecting the Corona" (Monthly Notices, xxxi. 184, 254) also deserve mention, as well as his discussions of the rotation of Mars, by which he deduced its period with a probable error of ±0.005. He also vigorously criticized the official arrangements for observing the transits of Venus of 1874 and 1882. His largest and most ambitious work, Old and New Astronomy, unfortunately left unfinished at his death, was completed by A. Cowper Ranyard and published in 1892. He settled in America some time after his second marriage in 1881, and died at New York on the 12th of September 1888.
PROCTOR

See Monthly Notices, xii. 164; Observatory, xi. 366; The Times, (Sept. 14, 1888); Knowledge (Oct. 1888, p. 265); Appleton's Annual Cyclopaedia, xiii. 707; Autobiographical Notes in New Science Review, i. 393.

PROCTOR, an English variant of the word procurator (q.v.); strictly, a person who takes charge or acts for another, and so approaching in meaning a "agent" (q.v.). The title is used in England in three principal senses.

1. A practitioner in the ecclesiastical and admiralty courts. A proctor in this sense is also a qualified person licensed by the archbishop of Canterbury to undertake duties such as are performed in other courts by solicitors, but this matter is now only of historical interest, since by the Judicature Acts 1873 and 1875 all the business formerly confined to proctors may be conducted by solicitors. The king's proctor is the proctor or solicitor representing the Crown in the courts of probate and divorce. In petitions of divorce or for declaration of nullity of marriage the king's proctor may, under direction of the attorney-general, and by leave of the court, intervene in the suit for the purpose of proving collusion between the parties. His power of intervening is limited, by the Matrimonial Causes Act 1860, to cases of collision only, but he may also, as one of the public, show cause against a decree nisi made absolute (see Decree nisi).

In the admiralty court, proctor procurator was an officer who, in conjunction with the king's proctor, acted as the attorney or solicitor in all causes concerning the lord high admiral's affairs in the high court of admiralty and other courts. The king's proctor so acted in all causes concerning the king.

2. A representative of the clergy in convocation. A proctor in this sense represents either the chapter of a cathedral or the beneficed clergy of a diocese. In the province of Canterbury two proctors represent the clergy of each diocese; in that of York there are two for each archdeaconry. In both alike each chapter is represented by one.

3. The name of certain important university officials. At Oxford the proctors (procuratores), under the statutes, supervise the transaction of university business and appoint delegates to look after any particular affairs wherever these are not otherwise provided for by the statutes. The are also members of all the important deans, except that of the University Press. They also act as the assessors of the chancellor or his commissary in particular matters dealt with in university. They supervise the voting at public meetings of the university and announce the results. They also have, according to the ancient statutes, the power of veto in convocation and congregation: no proposal can be passed into a statute or decree if twice vetoed by them. They are ex officio members of the hebdomadal council, the governing council of the university, and they are the assessors of the vice-chancellor when he confers degrees. When a degree is to be granted they walk down the hall in which the ceremony is performed, nominally to ask for the approval of the masters, and it was formerly the custom for any tradesman, or any other person, who had a claim of debt against the postulant for a degree, to pluck the gown of the proctor as he passed and request settlement of the debt before the degree was granted. The proctors are also responsible for the general order of the university, and they are charged with the duty of inquiring into and reporting on any breaches of its statutes, customs or privileges. They are empowered to punish undergraduates, or graduates under the degree of Bachelor of Civil Law and Master of Arts, by fine or by confinement to their colleges or lodgings (familiarly known as "gating"). They have to draw up the list of candidates for examination, and have to be present at all examinations, to see that they are properly conducted. They are responsible for the good order of the streets at night, so far as members of the university are concerned. For this purpose more especially each of them is empowered, immediately on his election, to nominate two masters of at least three years' standing as proctors. The proctors and pro-proctors take it in turn to perambulate the streets nightly, accompanied by two sworn constables, familiarly known as "bulldogs". The proctors are elected by the heads, fellows and resident members of convocation of each college in rotation. They are presented to the vice-chancellor with much ceremony, part of which consists in taking over the insignia of their office—a copy of the statutes and a bunch of keys—from their predecessors.

At Cambridge the proctors are nominated annually by the colleges in rotation and elected (a formal proceeding) by the senate. They must have been three years members of the senate and have resided two years at the university. The two proctors are, as at Oxford, nominated by the proctors, but are also elected by the senate on the nomination of the colleges, each college having the right to nominate a pro-proctor the year next before that in which it nominates the proctor (Grace of February 26, 1863). Two additional pro-proctors are also elected by the senate each year, on the nomination of the vice-chancellor and proctors, to assist the latter in the maintenance of discipline (Grace of June 6, 1878).

The early history of the office at Cambridge is obscure, but it seems that the proctors have always represented the colleges in university proceedings. At present their functions are twofold (1) as taking part in all university ceremonies, (2) as enforcing discipline in the case of members of the university who are in status pupillari (i.e. undergraduates and Bachelors of Arts and Law). (1) The proctors are not (as at Oxford) ex officio members of the council of the senate or of other boards or syndicates, except those with which their duties are specially connected. But their presence is essential at all congregations of the senate, at which the senior proctor reads all the "graces" (already approved by the council of the senate). If any grace is opposed by any member of the senate saying non placet the proctors take the votes of those present and announce the result. Graces are offered not only for making changes in university statutes and ordinances and for appointing examiners and the like, but also for granting degrees. When a degree is to be taken the college of the candidate presents a supplication or petition for the degree, this petition is approved by the council of the senate, when they have satisfied themselves that the candidate has (through the condition and is read at the congregation by the senior proctor; these supplicates are practically never opposed, but graces for new statutes and ordinances are frequently opposed, and on very important occasions many hundreds of non-resident members of the senate come up to record their votes. (2) The proctors' powers as to discipline have a very long history. As far as concerns members of the university they have authority to impose certain fines for minor offences, such as not wearing academical dress on occasions when it is ordered, and also to order a man not to be out of his college after a certain hour for a certain number of days ("gating"). In the case of more serious offences the proctor generally reports the matter to the authorities of the offender's college to be dealt with by them, or as an ultimate resort brings the offender before the university court of discipline, which has power to rusticate or expel. The power of the proctors over persons who are not members of the university dated from charters granted by Elizabeth I., which empowered the university authorities to search for undesirable characters, men and women, rogues, vagabonds, and other personas de mala suscepta, and punish them by imprisonment or banishment. In recent times this power was regularly exercised with respect to women of bad character. The proctors promenaded the streets attended by their servants (the bulldogs), who are always sworn in as special constables. If occasion arose the proctor could arrest a suspected woman and have her taken to the Spinning House (for which Hobson the carrier had left an endowment); the next day the woman was brought before the vice-chancellor, who had power to commit her to the Spinning House; as a general rule the sentence was not for a longer periror than three weeks. For this purpose the vice-chancellor sat in camera and the jurisdiction had nothing to do with that of the vice-chancellor's court. In 1868 attention was called to this procedure by the case of a girl named Daisy Hopkins, who was arrested and committed to the Spinning House. Application was made on her behalf to the Queen's Bench Division for a writ of habeas corpus, and when the application came on it appeared that there had been a technical irregularity (the
PRISCUS I—PROdidus of ceos

PR miscus (b. c. 455 or 450 B.C.), a Greek humanist of the first period of the Sophistical movement, known as the "precursor of Socrates." He was still living in 390 B.C. He came to Athens as ambassador from Ceos, and became known as a speaker and a teacher. Like Protagoras, he professed to train his pupils for domestic and civic affairs; but it would appear that, while Protagoras' chief instruments of education were rhetoric and style, Prodicus made ethics prominent in his curriculum. In ethics he was a pessimist. Though he discharged his civic duties in spite of a frail physique, he emphasized the sorrows of life; and yet he advocated no hopeless resignation, but rather the remedy of work, and took as his model Heracles, the embodiment of virile activity. The influence of his views may be recognized as late as the Shepherd of Hermas. His views on the origin of the belief in the gods is strikingly modern. First came those great powers which benefit mankind (comparing the worship of the Nile), and after these the demigods who have rendered services to humanity. But he was no atheist, for the pantheist Zeno spoke highly of him. Of his natural philosophy we know only the titles of his treatises On Nature and On the Nature of Man. His chief interest is that he sought to give precision to the use of words. Two of his discourses were specially famous; one, "On Propriety of Language," is repeatedly alluded to by Plato; the other, entitled θέα, contained the celebrated apologue of the Choice of Heracles, of which the Xenophontean Socrates (Mem. ii. 1, 21 seq.) gives a summary. Theramenes, Euripides and Isocrates are said to have been pupils or hearers of Prodicus. By his immediate successors he was variously estimated: Plato satirizes him in the early dialogues; Aristophanes in the Vespertual calls him "a babbling brook"; Aeschines the Sophistic condemns him as a sophist.

see Spengel, Artium scriptores, pp. 45 sqq.; Welcker, "Prodikos de Vorgänger des Sokrates," in Rheinisches Museum (1883), and in Riehe. Schriften, i. 395; Hummel, De Prisco Sophista (Leiden, 1846); Cougny, De Prisco Cete (Paris, 1858).
PRODIGY, an extraordinary or wonderful thing, person, event, &c; something which excites amazement and astonishment. The term has been particularly applied to children who display a precocious genius, especially in music. The German expression Wunderkind has of late been often adopted by those who have found the name "infant prodigy" too reminiscent of the "infant phenomenon" familiar to readers of Dickens. The Lat. prodigium, an omen, portent, and abnormal or monstrous event, is probably not to be derived from pro and dicere, to foretell, prophesy, but rather, on the analogy of adagium, adage, aphorism, from pro (pro before a vowel), and the root of aoe, I say.

PRODUCTION (Lat. productionem, from producere, to produce), in general, the act of producing, or bringing forth. Production, in contrast with distribution and consumption, is one of the great divisions which all treatises on economics make in dealing with the subject, and as such it is defined in every textbook and its elements and processes dealt with at length. J. R. McCulloch's definition may be given as one difficult to improve on: "by production, in the science of political economy, we are not to understand the production of matter, for that is the exclusive attribute of Omnipotence, but the production of utility, and consequently of exchangeable value, by appropriating and modifying matter already in existence, so as to fit it to satisfy our wants, and to contribute to our enjoyment."

W. S. Jevons says, "production is one of the very few happily chosen terms which the economist possesses. Etymologically the term implies that we draw wealth forth, and this is the correct idea of production." Though the mere definition of "production" as the creation of utilities is apparently simple enough, the treatment of the subject has varied from time to time in proportion to the changes which economic science has itself undergone; it has been said that the theory of production is based on unalterable natural facts, but even this cannot be too absolutely stated, for the organization of production changes with social growth. Much discussion has, during the growth of the science of economics, centred round what is and what is not productive or unproductive, and as to the relative importance of the functions of production and distribution.

See E. Canaan's History of the Theories of Production and Distribution (1893), and the standard treatises on economics. Also the articles, Capital, Value, Wealth.

PROFANITY, irreverent or blasphemous language, swearing, by the use of words casting derision on sacred or divine things, especially the taking of the name of God in vain (see Blasphemy; and Swearing). The word "profane," derived from Lat. profanum, outside the temple (sanum), hence opposed to sacrum or religiosum, in the sense of not sacred, common, is used in English not only as meaning irreverent, or blasphemous, but also in the senses of the original Latin, not initiated into sacred mysteries, hence, lay, secular, or as referring to subjects not connected with sacred or biblical matters, e.g. profane literature, history, &c.

PROFESSOR (the Latin noun formed from the verb professi, to declare publicly, to acknowledge, profess), a term now properly confined to a teacher of a special grade at a university. Its former significance of one who has made "profession" or open acknowledgment of religious belief, or, in particular, has made a promise binding the maker to a religious order, is now obsolete. The educational use is found in post-Augustan Latin, and professi is used by Pliny (Ep. ii. 18, 3. iv. 11, 14), absolutely, in the sense of "to be a teacher," an extension of the classical use in the sense of to practice, profess a science or art, e.g. proficiendi, a scholar, professor. In the universities it signified the conferring of a degree in any faculty or branch of learning meant the right or qualification to teach in that faculty, whence the terms magister, "master," and doctor for those on whom the degree had been granted. To these names must be added that of "professor." The "three titles of Master, Doctor, Professor, were in the middle ages absolutely synonymous" (H. Rashdall, The Universities of Europe in the Middle Ages, 1895, i. 21). At Paris in the faculties of theology, medicine and arts professor is more frequently used than doctor but less so than magister; at Bologna the teachers of law are known as professores or doctores (id.). From this position to that of the holder of an endowed "chair," the occupant of which is the principal public teacher of the particular faculty, the evolution was gradual. The first endowed professorship at Oxford was that of divinity, founded by the mother of Henry VII. in 1497 (?1502) and named after her the "Margaret Professorship." The foundation of the regius professorship by Henry VIII., in 1546 no doubt, as the New English Dictionary points out, tended to the general modern use of the word. Subordinate public teachers in faculties or in subjects to which a professorial "chair" is attached, are known as "readers" or "lecturers," and these titles are also used for the principal public teachers in subjects which have not reached professorial rank.

PROFILE, an outline or contour drawing, particularly the drawing of the outline of the human face as seen from the side, or in architecture the contour of a part of a building, of a moulding, &c., as shown by a vertical section. In fortification the "profile" of an earthwork is an outline of a transverse section and gives the relative thickness; so a work is said to be "of strong" or "of weak" profile. The Fr. profil, formerly porfil, pourfil, Ital. profilo, profilo, are formed from Lat. pro, and filare, to draw a line, filum, thread.

The French pourfil also gave English "purl," to embroider the edge of a fabric with gold or other thread; this was further corrupted to "purl," now often wrongly spelt "pearl," an invented stitch in knitting.

PROFIT-SHARING (i.e. between employer and employed), a method of remunerating labour, upon which the employees receive, in addition to ordinary wages, a share of the profit which the business realizes. The term is not infrequently used loosely to include many forms of addition to ordinary wages, such as bonus on output or quality, gain-sharing and product-bearing. Yet strictly, where an employee or a group works for a share of the product, or is paid so much in addition to ordinary wages in proportion as the product exceeds a certain quantity, or the quality exceeds a certain standard, in neither of these cases have we profit-sharing, for the net result of the business may be a large profit or a small one or a loss, and the employee's claim is unaffected. In the same way if a workman is employed on the basis that if in doing a particular job he saves something out of a stipulated time of labour, or a stipulated amount of materials, he shall receive in addition to ordinary wages a proportion of the value so saved, that is technically gain-sharing, not profit-sharing. Even when the bonus depends strictly on profit, it is not reckoned as profit-sharing, if it is confined to the leading employees. An agreement is of the essence of the matter. It is not profit-sharing where an employer takes something from his profits at his own will and pleasure, and gives it to his employees. Strictly such gifts in cash are gratuities, while, when they take other forms, such as better houses, libraries, recreation rooms, provision for sickness and old age, all given at the will of the employer, we have paternalism. Such benefits thus taken expressly from profits and varying more or less with the amount of profit certainly approach true profit-sharing: they are sometimes called "indeterminate" profit-sharing. Though many of the above methods of remunerating, or benefiting, the employed are from time to time included under profit-sharing even by writers of repute, the strict sense of the term was defined by the international congress on profit-sharing in 1889 as "an agreement whereby the employed receive a share of profits determined in advance." It does not follow that the agreement must be actually enforceable at law; some employers to protect themselves from litigation stipulate that it shall not be.

Profit-sharing, in the loose sense, must be of untold antiquity; the first great example of profit-sharing in the strict sense is that of the Parisian house-painter, Edme-Jean Leclaire, "The Father of Profit-Sharing." In 1842 he was employing 300 men...
PROGNATHISM—PROGRAMME MUSIC

don day wages. By greater zeal and intelligence and less waste, not necessarily by harder work, he reckoned they could save £200 a year; and he made it their interest to do so by arranging that they should receive the greater part of the saving themselves. This arrangement proved a very great success; the material gain to the men and the improvement in their morale were marked; and Leclaire, who began life with nothing and died worth £48,000, always maintained that, without the zeal drawn out in his men by profit-sharing, he never could have made so large a business or gained so much wealth. In 1908 the system was still in active operation in the firm. Its main features are as follows: after paying 5% interest on the capital, and some sums as wages of superintendence to the two managing partners, the remaining profit is divided into four parts, one of which goes to the managing partners, one to the Mutual Aid Society, and the remaining half to the employees as a dividend on their ordinary wages, exclusive of piece-work and overtime, on which no dividend is paid. The Mutual Aid Society is a registered body, and is a limited partner in the firm, the liability of the two managing partners being unlimited and the capital resting entirely on their hands. The benefits of the Mutual Aid Society, and of the profit-sharing generally, are enjoyed in the main by all the employees of the business, but certain advantages are confined to a limited number of permanent employees.

Leclaire’s system attracted the marked interest of John Stuart Mill and other English economists, and in 1865–1867 a number of experiments in profit-sharing, or as it was then called, industrial partnership, were made in England, the most noted being that of Henry Briggs, Son & Co., at their collieries in Yorkshire. The main object in this case was to detach the workmen from the trade union and attach them to the firm. In other ways the experiment was very successful, and £40,000 was divided as bonus on wages in nine years, but the main object was not attained; and when the price of coal fell heavily after the inflation of 1873 Briggs’s men joined the strike to resist a reduction of wages, and the experiment came to an end.

The present extent of profit-sharing, though in itself considerable, is but small in comparison with the vast extent of the world’s commerce and industry, and except in one of its developments, co-partnership, it can hardly be said to be making progress. In 1906 there were in the United Kingdom and its colonies 65 ordinary firms practising profit-sharing in its strictest sense, and 17 others known to have adopted and not known to have discontinued it, making 82 in all as against 92 in 1901, and 101 in 1894. On the other hand the number of employees had grown from 28,000 in 1894 to 48,000 in 1906. In addition about one-fourth of the workmen’s co-operative societies in Great Britain (see Co-operation) practise profit-sharing with perhaps 30,000 employees.

In 1894 it was found that there were more profit-sharing firms in the British Empire than in any other country, and this is probably still true. The only rival is France, where, however, the term “participation aux bénéfices” is used in a wider sense. There were 306 profit-sharing societies in Germany, the United States, Switzerland (where the state or state applied the system in the postal service, and still does in the telegraphs), in Holland, in the socialist co-operative societies of Belgium, and elsewhere.

Profit-sharing has been quickly abandoned in many instances, for various reasons; there were no profits to divide; the small bonus given seemed to have no effect; the hope of detaching the men from their union, or containing them with lower wages, was not realized; or the business passed into unsympathetic hands. On the other hand, one lasting success in such a matter proves more than many short experiments which failed; and profit-sharing has been splendidly successful where some high-minded man has breathed into it the spirit of partnership. Often it has been a step to actual partnership; the workman has not only received a share of profit, as added remuneration of his labour, but been led on to invest in the capital of the business, and as a shareholder, to take his share of the profits paid on capital, as well as of responsibility, of loss if any, and of control. This system of profit-sharing plus shareholding is now known as co-partnership (see Co-operation), and is making undoubted progress. It is exemplified in nearly all profit-sharing co-operative societies, and in a growing number of businesses of non-co-operative origin which accumulate part or the whole of labour’s profit in shares. In 1908, in the Familistère of Guise the whole capital of £300,000 belonged to the workers and a few retired workers, in Leclaire’s old business the Mutual Aid Fund owned half, in the Laroche-Joubert paper-works the employees owned more than two-thirds. In the South Metropolitan Gas Co. the employees owned £37,000 and elected three of the nine directors. It would seem to be in this direction, as a step to full partnership, that profit-sharing has a great future before it.

Bibliography.—A large number of works are noted in the International Co-operative Bibliography (London, 1906; International Co-operative Alliance). The following may be specially mentioned: Sedley Taylor, Profit-sharing between Capital and Labour (London, 1884; New York, 1886); N. P. Gilman, Profit-sharing between Employer and Employed (London and New York, 1892); and N. P. Gilman, A Report to Labour (London and Boston, 1900); Board of Trade Report by D. F. Schloss, on Profit-sharing (London, 1894; with yearly addenda in the Labour Gazette); D. F. Schloss, Methods of Industrial Remuneration (London, 1894); Victor Böhmert, Die Gewinnbeteiligung (Leipzig, 1878, and Dresden 1903); Publications of the Société pour l’étude de la participation (Paris, 1879 and onwards); Albert Trombert, Guide pratique de la participation (Paris, 1892); International Co-operative Alliance publications, especially Report of Fifth Congress (London, 1902); Labour Co-partnership Association Reports and Publications (London, 1883, and onwards).

(A. W. L.)

PROGNATHISM (Gr. πρόφορον, forward, and γνάθος, jaw), the term applied by ethnologists, with its opposite Orthognathism (bēbōs, straight), to describe the varying degrees of projection of the upper jaw, which itself is determined by the angle made by the whole face with the brain-caps. Eurygnathism (eplōs, wide), is the lateral projection of jawbones so characteristic of the Mongolic races. (See CRANIOLOGY.)

PROGNOSIS (Gr. πρόγνωσις, knowledge of recognition beforehand, from προγνωνίσκω, to know beforehand, cf. “prognostic”); a term of medical doctrine (cf. modern medicine, as it was in Greece, for an opinion, forecast or decision as to the probable course, duration and termination of a case of disease. It is to be distinguished from “diagnosis” (Gr. διάγνωσις, διαγνωσκω to distinguish), the determination or identification of a disease in a particular case from an investigation of its history and symptoms.

PROGRAMME, or Program, in its original use, following that of Gr. πρόγραμμα, a public notice (προγράφων, to make public by writing), now chiefly in the sense of a printed notice containing the items of a musical concert, with the names of the pieces to be performed, the composers and the performers, or of a theatrical performance, with the characters, actors, scenes, &c. In a wider sense the word is used of a syllabus or scheme of study, order of proceedings or the like, or of a catalogue or schedule containing the chief points in a course of action, and so, politically, in the sense of a list of the principal objects on which a party proposes to base its legislative course of action, as is the case in Newcastle, drawn up by the Liberal Federation. The spelling “program,” now general in America, was that first in use in England, and so continued till the French form “programme” was adopted at the beginning of the 19th century. The New English Dictionary considers the earlier and modern American spelling preferable, on the analogy of “diagram,” “telegram,” “cryptogram” and the like. Scott and Carlyle always used “program.”

PROGRAMME MUSIC, a musical nickname which has passed into academic currency, denoting instrumental music without words but descriptive of non-musical ideas. Musical sounds lend themselves to descriptive purposes with an ease which is often uncontrollable. A chromatic scale may suggest the whistling of the wind or the cries of cats; reiterated staccato notes may suggest many things, from raindrops to the cackling of hens. Again, though music cannot directly imitate anything
in nature except sounds, it has a range of contrast and a power of climax that is profoundly emotional in effect; and the emotions it calls up may resemble those of some dramatic story, or those produced by the contemplation of nature. But chromatic scales, reiterated notes, emotional contrasts and climaxes, are also perfectly normal musical means of expression; and the attempts to read non-musical meanings into them are often merely annoying to composers who have thought only of the music. Some distinguished writers on music have found a difficulty in admitting the possibility of emotional contrasts and climaxes in an art without an external subject-matter. But it is impossible to study the history of music without coming to the conclusion that in all mature periods music has been self-sufficient to this extent, that, whatever stimulus it may receive from external ideas, and however much of these ideas it may have embodied in its structure, nothing has survived as a permanently intelligible classic that has not been musically coherent to a degree which seems to drive the subject-matter into the background, even in cases where that subject-matter is naturally present, as in songs, choral works and operas. In short, since sound as it occurs in nature is not sufficiently highly organized to form the raw material for art, there is no natural tendency in music to include, as a "subject," any item conceivable apart from its artistic embodiment. Explicit programme music has thus never been a thing of cardinal importance, either in the transitional periods in which it has been most prominent, or in the permanent musical classics.

At the same time, artistic creation is not a thing that can be governed by any a priori metaphysical theory; and no great artist has been so ascetic as to always resist the inclination to act on the external ideas that impress him. No composer writes important music for the voice without words; for speech is too ancient a function of the human voice to be ousted by any a priori theory of art; and no really artistic composer, handling a living art-form, has failed to be influenced, sooner or later, by the words which he sets. It matters little if these words be in themselves very poor, for even false sentiment must make some appeal to true experience, and the great composers are quicker to seize the truth than to criticize its verbal presentation or to suspect insincerity. The earliest mature musical art was, then, inevitably descriptive, since it was vocal. So incessant is the minute onomatopeia of 16th-century music, both in the genuine form of sound-painting (Tonalerei) and in the spurious forms to which composers were led by the appearance of notes on paper (e.g. quick notes representing "darkness" because they are printed black) that there is hardly a page in the productions of the "golden age of music which has not its descriptive aspect. Programme music, then, may be expected to derive many of its characteristics from ancient times; but it cannot properly be said to exist until the rise of instrumental music, for not until then could music be based upon external ideas that did not arise inevitably from the use of words or dramatic action.

The resources of the modern orchestra have enabled recent composers to attain a realism which makes that of earlier descriptive music appear ridiculous; but there is little to choose between classics and moderns in the intellectual childishness of such realism. Thunderstorms, bird-songs and pastoral effects galore have been imitated by musicians great and small from the days of the Fitzwilliam Virginal Book to those of the episode of the flock of sheep in Strauss's Don Quixote. And, while the progress in realism has been so immense that the only step which remains is to drive a real flock of sheep across the concert-platform, the real programme composers seem to be no further than that from inexpensive to expensive rubbish. What is really important, in the programme music of Strauss no less than that of the classics, is the representation of characters and feelings. In this respect the classical record is of high interest, though the greatest composers have contributed but little to it. Thus the Bible Sonatas of J. Kuhnau (published in 1700) and Bach's early Capriccio on the Departure of a Beloved Brother, which is closely modelled on Kuhnau's programme music, show very markedly the tendency on the one hand to illustrate characters and feelings, and on the other hand to extract from their programmes every occasion for something that would be a piece of incidental music if the stories were presented as dramas. Thus, though Kuhnau in his naïve expository preface to his first Bible sonata seems to be trying, like a child, to frighten himself into a fit by describing the size and appearance of Goliath, in the music it is only le bravo of Goliath that are portrayed. Thus the best movement in the Goliath sonata is a figured chorale (Aus tiefer Noth schreit ich zu Dir) representing the terror and prayers of the Israelites. And thus the subjects of the other sonatas (Saul cured by David's music; The Marriage of Jacob; Heshchiah; Gideon; and The Funeral of Jacob) are in various quaint ways musical because ethical; though Kuhnau's conceptions are far better than his execution. In the same way Bach makes his Capriccio descriptive of the feelings of the anxious and sorrowing Hecuba of the departing brother, and his attempt the form of a lively fugue, very much in Kuhnau's best style, on the themes of the postilion's coachman and cracking whip. Even Buxtehude's musical illustrations of the "nature and characters of the planets" are probably not the aburdities they have been hastily taken for by writers to whom their title seems nonsensical; for Buxtehude, would, of course, take an astrological rather than an astronomical view of the subject, and so the planets would represent temperaments, and their motions the music of the spheres.

Nearly all the harpsichord pieces of Couperin have fantastic titles, and a few of them are descriptive music. His greater contemporary and survivor, Rameau, was an opera composer of real importance, whose harpsichord music contains much that is ingeniously descriptive. La Poule, with its theme inscribed "coo-coo-coo-coo-coo," is one of the best harpsichord pieces outside Bach, and is also one of the most minutely realistic compositions ever written. French music has always been remarkably dependent on external stimulus, and nearly all its classics are either programme music or operas. And the extent to which Rameau's jokes may be regarded as typically French is indicated by the fact that Haydn apologized for his imitation of frogs in The Seasons, saying that this "französische Quark" had been forced on him by a friend. But throughout the growth of the sonata style, not excepting Haydn's own early work, the tendency towards gratuitously descriptive music is very prominent; and the symphonies of Dittersdorf on the Metamorphoses of Ovid are excellent examples of the way in which external ideas may suggest much that is valuable to a musician who struggles with new forms, while at the same time they may serve to distract attention from points in which his designs break down. (See Stimmungsmusik.) Strict accuracy would forbid us to include in our survey such descriptive music as comes in operatic overtures or other pieces in which the programme is really necessitated by the conditions of the art; but the line cannot be so drawn without cutting off much that is essential. From the time of Gluck onwards there was a natural and steady growth in the descriptive powers of operatic music, which could not fail to react upon purely instrumental music; but of programme music for its own sake we may say there is no first-rate classic on a large scale before Beethoven, though Beethoven himself could no more surpass Haydn in illustrating an oratorio text (as in the magnificent opening of The Creation) than Haydn could surpass Handel.

L. Mozart's Musikalischer Spass is a solitary example of a special branch of descriptive music; a burlesque of incompetent performers and incompetent composition which, however humorous, is not without some interest for those who care for the history of classical formulas; the inevitable processes by which the "hollowers" in composition seem to arrive as by natural laws, further complicated by the equally natural laws of the howlers in performance; and the unfailing atmosphere of good nature with which Mozart satirizes, among other things, his own style; all combine to make this work very interesting on paper. The effect in performance is astonishing; so exactly, or rather so ideally, is the squallid effect of bad structure and performance kept at a

PROGRAMME MUSIC
constant level of comic interest. (In the Leipzig edition of the parts of this work the modern editor has added a new and worthy act to Mozart's glorious farce by correcting and questioning many of the mistakes!) Mozart's burlesque has remained unapproached, even in dramatic music. Compared with it, Wagner's portrait of Beckmesser in Die Meistersinger seems embittered in conception and disappointing in comic effect. Mendelssohn is said to have had a splendid faculty for extemporizing similar musical jokes. His Funeral March of Pyramus and Thisbe in the Midsummer Night's Dream, and Cornelius's operatic trio in which three persons conjugate the verb Ich sterbe den Tod des Verräters, are among the few examples of a burlesque in which there is enough musical sense to keep the joke alive. Such burlesques have their bearing on programme music, in so far as they involve the musical portrayal of character and give opportunity for masterly studies of the psychology of failure. Their special resources thus play a large part in the recent development of the symphonic poem by Richard Strauss, whose instrumental works avowedly illustrate his cheerfully pessimistic views on art and life. But into the main ethics of programme music this kind of characterization hardly enters at all.

Beethoven was three times moved to ascribe some of his profoundest music to an external source. In the first instance, that of the Eroica Symphony, he did not really produce anything that can fairly be called programme music. Napoleon, before he became emperor, was his ideal hero; and a triumphant symphony, on a gigantic scale and covering the widest range of emotion expressible by music, seemed to him a tribute due to the liberator of Europe; until the liberator became the tyrant. That the slow movement should be a funeral march was, in relation to the heroic tone of the work, as natural as that a symphony should have a slow movement at all. There is no reason in music why the idea of heroic death and mourning should be the end of the representation of heroic ideals. Hence it is unnecessary, though plausible, to hear, in the lively whispering opening of the scherzo, the babel of the fickle crowd that soon forgets its hero; and the criticism which regards the finale as "an inappropriate concession to sonata form" may be dismissed as merely unmusical without therefore being literary. Beethoven's next work inspired from without was the Pastoral Symphony: and there he records his theory of programme music on the title-page, by calling it "rather the expression of feeling than tone-painting." There is not a bar of the Pastoral Symphony that would be otherwise if its "programme" had never been thought of either by Beethoven or by earlier composers. The nightingale, cuckoo and quail have exactly the same function in the coda of the slow movement as dozens of similar non-thematic episodes at the close of other slow movements (e.g. in the violin sonata Op. 24, and the pianoforte sonata in D minor). The "merry meeting of country folk" is a subject that lends itself admirably to Beethoven's form of scherzo (q.v.); and the thunderstorm, which interrupts the last repetition of this scherzo, and forms an introduction to the finale, is none the less purely musical for being, like several of Beethoven's inventions, without any formal parallel in other works. Beethoven's Battle Symphony is a clever pot-boiler, which, like most musical representations of such noisy things as battles, may be disregarded in the study of serious programme music. His third great example is the sonata Les Adieux, l'absence et le retour. Here, again, we have a monument of pure sonata form; and, whatever light may be thrown upon the musical interpretation of the work by a knowledge of the relation between Beethoven and his friend and patron the Archduke Rudolph and the circumstances of the archduke's departure from Vienna during the Napoleonic wars, far more light may be thrown upon Beethoven's feelings by the study of the music in itself. This ought obviously to be true of all successful programme music; the music ought to illustrate the programme, but we ought not to need to learn or guess at quantities of extraneous information in order to understand the music. No doubt much ingenuity may be spent in tracing external details (the end of the first move-
degrees of conviviality returning home from the ball? The whole design is notoriously full of similar incongruities, of which there are the more significant for being the most plausible. There is hardly a single work of Berlioz except the Harold symphony and the Symphonie fantastique, in which the determination to write programme music does not frequently yield to the impulse to make singers get up and explain in words what it is all about. The climax of absurdity is in the Symphonie funèbre et triomphale, written for the inauguration of the Bastille Column, and scored for an enormous military band and chorus. The first movement is a funeral march, and is not only one of Berlioz's finest pieces, but probably the greatest work ever written for a military band. The Apothéose chorus is in the form of a triumphal march. Because the occasion was one on which there would be plenty of real speeches, Berlioz must needs write a connecting link called Oraison funèbre, consisting of a sermon delivered by a solo trombone; presumably for use in later performances. His native Gasconade genius prefers this to the use of the chorus!

Current modern criticism demands plausibility, though it cares little for intellectual soundness: and while practically the whole of Liszt's work is professedly programme music (where it is not actually vocal) and, though there is much in it which is incomplete without external explanation, Liszt's "modern" idiom has the advantage of being free from the old classical limitations. All his unreason of style, Liszt's symphonic poems are remarkable steps towards the attainment of a kind of instrumental music which, whether its form is dictated by a programme or not, is at any rate not that of the classical symphony. The programmes of Liszt's works have not always, perhaps not often, produced a living musical form; a form, that is, in which the rhythms and proportions are neither stiff nor nebulous. Both in breadth of design and organization and flow, the works of Richard Strauss are as great an advance on Liszt as they are more complex in musical, realistic, and autobiographical content. Being, with the exception of the latest French orchestral developments, incomparably the most important works illustrating the present state of musical transition, they have given rise to endless discussions as to the legitimacy of programme music. Such discussions are mere windmill-tilting unless it is constantly borne in mind that no artist who has anything of his own to say will ever be prevented from saying it, in the best art-forms attachable in his day, by any scruples as to legitimacy of programme music.

There is only one thing that is artistically legitimate, and that is a perfect work of art. And the only thing demonstrably prejudicial to such legitimacy in a piece of programme music is that even the most cultured of musicians generally understand music better than they understand anything else, while the greatest musicians know more of their art than is dreamt of in general culture. (D. F. T.)

**PROHIBITION** (Lat. *prohibere*, to prevent), a term meaning the action of forbidding or preventing by an order, decree, &c. The word is particularly applied to the forbidding by law of the sale and manufacture of intoxicating liquors (see *Liquor Laws* and *Temperance*). In law, as defined by Blackstone, prohibition is "a writ directed to the judge and parties of a suit in any inferior court, commanding them to cease from the prosecution thereof, upon a surmise either that the cause originally or some collateral matter arising therein does not belong to that jurisdiction, but to the cognizance of some other court." A writ of prohibition is a prerogative writ, that is, to say, it does not issue as of course, but is granted only upon grounds being shown. Before the Judicature Acts prohibition was granted by one of the superior courts at Westminster; it also issued in certain cases from the court of chancery. It is now granted by the High Court of Justice. Up to 1875 the high court of admiralty was for the purposes of prohibition an inferior court. But now by the Judicature Act 1873, s. 24, it is provided that no proceeding in the High Court of Justice or the court of appeal is to be restrained by prohibition, a stay of proceedings taking its place where necessary. The admiralty division being now one of the divisions of the High Court can therefore no longer be restrained by prohibition. The courts to which it has most frequently issued are the ecclesiastical courts, and county and other local courts, such as the lord mayor's court of London, the court of passage of the city of Liverpool and the court of record of the hundred of Salford. In the case of courts of quarter sessions, the same result is generally obtained by *certiorari* (see *Writ*). The extent to which the ecclesiastical courts were restrainable by prohibition led to continual disputes for centuries between the civil and the ecclesiastical authorities. Attempts were made at different times to define the scope of the writ, the most conspicuous instances being the statute *Circumspexite Agatis*, 13 Edw. I. st. 4; the *Articuli clerii*, 9 Edw. II. st. 1; and the later *Articuli clerii* of 3 Jac. I., consisting of the claims asserted by Archbishop Bancroft and the reply of the judges. The law seems to be undoubtedly that the spiritual court acting in spiritual matters *pro salute animae* cannot be restrained. The difficulties arise in the application of the principle to individual cases. Prohibition lies either before or after judgment. In order that proceedings should be restrained after judgment it is necessary that want of jurisdiction in the inferior court should appear upon the face of the proceedings, that the party seeking the prohibition should have no right in the inferior court, or that he was in ignorance of a material fact. A prohibition goes either for excess of jurisdiction, as if an ecclesiastical court were to try a claim by prescription to a pew, or for transgression of clear laws of procedure, as if such a court were to require two witnesses to prove a payment of tithes. It will not as a rule be awarded on a matter of practice. The remedy in such a case is appeal. Nor will it go, unless in exceptional cases, at the instance of a stranger to the suit. The procedure in prohibition is partly common law, partly statutory. Application for a prohibition is usually made ex parte to a judge in chambers on affidavit. The application may be granted or refused. If granted, a rule to show cause why a writ of prohibition should not issue goes to the inferior judge and the other party. In prohibition to courts other than county courts pleadings in prohibition may be ordered. These pleadings are as far as possible assimilated to pleadings in actions. They are rare in practice, and are only ordered in cases of great difficulty and importance. Much learning on the subject of prohibition will be found in the opinion of Mr Justice Wills delivered to the House of Lords in *The Mayor and Aldermen of London v. Cox* (1867, L.R. 2 Eng. and I. Appeals, 329).

In Scots law prohibition is not used in the English sense. The same result is obtained by suspension or reduction. In the United States the Supreme Court has power to issue a prohibition to the district courts when proceeding as courts of admiralty and maritime jurisdiction. Most of the states have also their own law upon the subject, generally giving power to the supreme judicial authority in the state to prohibit courts of inferior jurisdiction.

**PROJECTION**, in mathematics. If from a fixed point S in space lines or rays be drawn to different points A, B, C, ... in space, and if these rays are cut by a plane in points A', B', C', ... the latter are called the projections of the given points on the plane. Instead of the plane another surface may be taken, and then the points are projected to that surface instead of to a plane. In this manner any figure, plane or in space of three dimensions, may be projected to any surface from any point which is called the centre of projection. If the figure projected is in three dimensions then this projection is the same as that usual in what is generally known as *perspective* (q.v.).

In modern mathematics the word *projection* is often taken with a slightly different meaning, supposing that plane figures are projected into plane figures, but three-dimensional ones into three-dimensional figures. Projection in this sense, when treated by co-ordinate geometry, leads in its algebraical aspect to the theory of linear substitution and hence to the theory of invariants and co-variants (see *algebraic Forms*).

In this article projection will be treated from a purely geometrical point of view. References like (G. § 87) relate to the article *Geometry*, § *Projective*, in vol. xi.
§ 1. Projection of Plane Figures.—Let us suppose we have in space two planes π and π'. In the plane π a figure is given having known properties; then we have the problem to find its projection from the plane π to the plane π', i.e., to project from the known properties of the given figure the properties of the new one.

If a point A is given in the plane π we have to join it to the centre S and find the point A' where this ray SA cuts the plane π'; in the plane π' all points A' are given in the plane π is then A will be its projection in π. Hence if one figure in π is the projection of another in π, then conversely the latter is also the projection of the former.

A projection is therefore also called corresponding points, and similarly we speak of corresponding lines and curves, &c.

§ 2. We at once get the following properties:

The projection of a point is a point, and one point only.
The projection of a line is a line, for all points in a line are projected by rays which lie in the plane determined by S and the line, and this plane cuts the line in a line which is the projection of the given line.

If a point lies in a line its projection lies in the projection of the line.

The projection of the line joining two points A, B is the line which joins the projections A', B' of the points A, B. For the projecting plane of the line AB contains the rays SA, SB which project the points A, B.

The projection of the point of intersection of two lines a, b is the point of intersection of the projections a', b' of these lines.

Similarly we can talk of lines and curves.

The projection of a curve is a curve.

The projections of the points of intersection of two curves are the points of intersection of the projections of the given curves.

If a line cuts a curve in π, the inverse projection of the line cuts the projection of the curve in π points. —

The order of a curve remains unaltered by projection.

The projection of a tangent to a curve is a tangent to the projection of the curve.

The tangent to the tangent in π is a line which has two coincident points in common with a curve.

The number of tangents that can be drawn from a point to a curve remains unaltered by projection. —

The class of curves remains unaltered by projection.

§ 3. Two figures of which one is a projection of the other obtained in the manner described may be moved out of the position in which they are obtained. They are then still said to be one the projection of the other and vice versa.

When they are in the position originally considered they are said to be in perspective position, or (shorter) to be perspective.

All the properties stated in §§ 1, 2 hold for figures which are perspective, whether they are perspective or not. There are others which hold only for projective figures when they are in perspective position, which we shall now consider.

If two planes π and π' are perspective, then their line of intersection is called the axis of perspective or homology, and the intersection of AA', BB', CC', i.e., S is the figure, the centre of perspective.

Secondly, if the triangles ABC and A'B'C' lie both in the same plane, and the same plane the above proof does not hold. In this case we may consider the plane figure as the projection of the figure SABC which we have just proved the theorem. Let ABC, A'B'C' be the co-linear triangles with S as centre, so that AA', BB', CC' meet at S. Take any point in space, say your eye E, and from it draw the rays projecting through AA', BB', CC'. In the line of sight of any point S, and in EA, EB, EC take points A, B, C, respectively, so that S, A, B, C are not in a plane, ESA which projects the line SA, and also EA', A'B', A'C', BB', C'C', ESA which projects the line SA, and also EA', A'B', A'C', BB', C'C', then these will meet each other in a point A', of which A' will be the projection.

Similarly points B', C' are found. Hence we have now in space two triangles A, B, C and A', B', C', which are co-linear. They are therefore co-axal, that is, the points P, Q, R, where A, B, C, &c., meet will lie in a line. Their projection therefore lie in a line. But these are the points P, Q, R, which were to be proved to lie in a line.

This proves the first part of the theorem. The second part or converse theorem is proved in exactly the same way. For another proof see (G. § 37).

§ 5. By aid of this theorem we can now prove a fundamental property of two projective planes.

Let two planes, and let A, A', B, B' be two pairs of corresponding points which we suppose fixed, and C, C' any other pair of corresponding points. Then the triangles ABC and A'B'C' are co-axal, and they will remain co-axal if the one plane is turned through any angle to the other about the axis. They will therefore, by Desargue's theorem, remain co-linear, and the centre will be the point S, where AA' meets BB'. Hence the line joining any pair of corresponding points C', C, will pass through the centre S'. The lines joining corresponding points will therefore lie in a line. This will remain true if the planes are turned till they coincide, because Desargue's theorem remains true.

Two planes are perspective, then if the one plane be turned about the axis through any angle, especially if the other plane be turned till it coincides with the other, the two planes will remain perspective; corresponding lines will still meet on a line called the axis, and the lines joining corresponding points will still pass through a common point situated in the plane perpendicular to the axis.

Whilst the one plane is turned this plane S will move in a circle whose centre lies in the plane π, which is kept fixed, and whose plane is perpendicular to the axis.

The last part will be proved presently. As the plane π may be turned about the axis in one or the opposite sense, there will be two perspective positions possible when the planes coincide.

Let the planes intersecting in the axis s whilst S is the centre of projection. To project a point A in π we join A to S and see where this line cuts π'. This gives the point A'. But if we draw through S any line parallel to π, then this line will cut π' in some point I', and if all lines through S be drawn which are parallel to π these will form a plane parallel to π which will cut the plane π' in a line I' parallel to the axis s. If we say that a line parallel to a plane cuts the latter at an infinite distance, we may say that there is another plane at an infinite distance in π are projected into points which lie in a straight line.

Hence all points in the line are projected to an infinite distance in π, whilst all other points are projected to finite points.

We say therefore that all points in the plane π at an infinite distance may be considered as lying in a straight line, because then the lines through π which are parallel to π pass into themselves.

Thus we are again led to consider points at infinity in a plane at infinity in a plane. In the plane π.

§ 7. If we suppose through S a plane drawn perpendicular to the axis s cutting it at T, and in this plane the two lines Sf parallel to π and SJ parallel to π', then the lines through I' and J
parallel to the axis will be the lines $i'$ and $j$. At the same time a parallelogram $SJT'IS'$ has been formed. If now the plane $\pi'$ be turned about the axis, then the points $I'$ and $J$ will not move in their planes; hence the lengths $TJ$ and $T'I'$, and therefore also $S'I'$ and $S$J, will not change. If the plane $\pi'$ is kept fixed in space the point $J$ will remain fixed, and $S$ describes a circle about $J$ as center and with $SJ$ as radius. This proves the last part of the theorem in § 8.

§ 8. The plane $\pi'$ may be turned either in the sense indicated by the arrow at $Z$ or in the opposite sense till $i'$ falls into $i$. In the first case we get a figure like fig. 3; $i'$ and $j$ will be on the same side of the axis, and on this side will also lie the centre $S$; and

![Fig. 3](image)

then $ST = SJ + S'I'$ or $S'I' = JT$, $SJ = JT'$. In the second case (fig. 4) $i'$ and $j$ will be on opposite sides of the axis, and the centre $S$ will lie on the line $i'$ in such a way that $S'I = T = T'$. If $IS = SJ$, the point $S$ will lie on the axis.

It follows that any one of the four points $S$, $T$, $J$, $I'$ is completely determined by the other three: if $i'$ is the plane, the axis, and one of the lines $i'$ or $j$ are given the other is determined; the three lines $i$, $j$, $i'$ determine the centre; the centre and the lines $i'$, $j'$ determine the axis.

§ 9. We shall now suppose that the two projective planes $\pi$, $\pi'$ are perspective and have been made to coincide.

If we choose a pair of corresponding points $\pi$ on a line through the centre or one pair of corresponding lines meeting on the axis are given, then the whole projection is determined.

Proof.—If $A$ and $A'$ (fig. 1) are given corresponding points, it has to be shown that we can find to every other point of $B'$ the corresponding point $B'$. Join $AB$ to cut the axis in $R$. Join $AR'$; then $B'$ must lie on this line. But it must also lie on the line $SB$. Where both meet is $B$. That the figures thus obtained are really projective can be seen by aid of the theorem of § 4. For, if for any point $C$ the corresponding point $C'$ be found, then the triangles $ABC$ and $A'B'C'$ are, by construction, co-linear, hence co-axal, and $s$ will be the axis, because $AB$ and $AC$ meet their corresponding lines $A'B'$ and $A'C'$ on it. $BC$ and $B'C'$ therefore also meet on $s$.

If on the other hand $a'$, $a$ are given corresponding lines, then any line through $S$ will cut them in corresponding points $A$, $A'$ which may be used as above.

The case in which the points are projective or perspective have been considered in the article GEOMETRY (G. §§ 12–40). All that has been said there holds, of course, here for any pair of corresponding pencils. The centre of perspective for any pair of corresponding pencils is the point of infinity of the line joining the corresponding points $A'$. This line contains coincident corresponding elements. Corresponding pencils on the other hand have their axis of perspective on the axis of projection whilst the coincident rays pass through the centre.

We mention here a few of those properties which are independent of the perspective position:

The correspondence between two projective rows or pencils of points is completely determined if three elements in one the corresponding ones in the other are given. For instance in two projective rows there is determined a pair of corresponding points which is given, then we can find to every other point in either the corresponding point (G. §§ 29–36). If $A$, $B$, $C$, $D$ are four points in a row and $A'$, $B'$, $C'$, $D'$ the corresponding points, then their cross planes are equal (AB, $CD$) = (AB', $CD'$) = (AC', $BD'$).

If in particular the point $D$ be at infinity we have $(AB, CD) = -AC/BC = AC/BC$. If therefore the points $D$ and $D'$ are both at infinity we have $AC/BC = AD/BD$, and the rows are similar (G. §§ 39). This $\pi'$ only happen in special cases. For the line joining corresponding points passes through the centre; the latter must therefore lie at infinity if $D$, $D'$ are different points at infinity. But if $D$ and $D'$ coincide they must lie on the axis, that is, at the point at infinity of the axis unless the axis is altogether at infinity. Hence

In two projective planes every row which is parallel to the axis is similar to its corresponding row, and in general no other row has this property.

But if the centre or the axis is at infinity then every row is similar to its corresponding row.

In either of these two cases the metrical properties are particularly simple. If the axis is at infinity the ratio of similitude is the same for all rows and the figures are similar. If the centre or the axis is at infinity we get parallel projection; and the ratio of similitude changes from row to row (see §§ 16, 17).

In both cases the mid-points of corresponding segments will be corresponding points.

§ 11. Involution.—If the planes of two projective figures coincide, then every point in their common plane has to be counted as a point in the other. If the projection $\pi'$ and $\pi$ are parallel, then the point $P$ in the figure $\pi'$.

The points $A'$ and $B$ corresponding to them will in general be different points, but it may happen that they coincide.

Here a theorem holds similar to that about rows (G. §§ 76 seq.). If we have two projective planes $\pi$, $\pi'$ such that for every point $P$ in the plane plane the same point corresponds, whether we consider the point as belonging to the first or to the second plane, then the same will happen for every other point—that is to say, to every point will correspond the same point in the first as in the second plane.

In this case the figures are said to be in involution.

Proof.—Let (fig. 5) $S$ be the centre, $s$ the axis of projection, and let a point denoted by $A$ in the first plane and by $B'$ in the second have the property that the points $A'$ and $B$ corresponding to them again coincide. Let $C$ and $D'$ be the names which some other point has in the two planes. Then $A'$ must be the point $B'$, and $B'$ to $C$ in the same sense as $A'$ to $C$. Hence the point $D'$ to $C$ in the same sense as $A'$ to $C$.

This $\pi'$ might also be got by drawing CB and joining its intersection $Y$ with the axis to $B'$. Then $C$ must be the point $B'$, and $B'$ to $C$ in the same sense as $A'$ to $C$. Hence the point $D'$ to $C$ in the same sense as $A'$ to $C$.

If the two projective planes $\pi$, $\pi'$ are parallel, through $A'$ and $B'$, and $B'$ and $C$, and if to one point in their common plane the same point corresponds, whether we consider the point as belonging to the first or to the second plane, then the same will happen for every other point—that is to say, to every point will correspond the same point in the first as in the second plane. In this case the figures are said to be in involution.

If the two projective planes $\pi$, $\pi'$ are parallel, through $A'$ and $B'$, and $B'$ and $C$, and if to one point in their common plane the same point corresponds, whether we consider the point as belonging to the first or to the second plane, then the same will happen for every other point—that is to say, to every point will correspond the same point in the first as in the second plane. In this case the figures are said to be in involution.

This theorem holds similar to that about rows (G. §§ 76 seq.). If we have two projective planes $\pi$, $\pi'$ such that for every point $P$ in the plane plane the same point corresponds, whether we consider the point as belonging to the first or to the second plane, then the same will happen for every other point—that is to say, to every point will correspond the same point in the first as in the second plane.

In this case the figures are said to be in involution.

Proof.—Let (fig. 5) $S$ be the centre, $s$ the axis of projection, and let a point denoted by $A$ in the first plane and by $B'$ in the second have the property that the points $A'$ and $B$ corresponding to them again coincide. Let $C$ and $D'$ be the names which some other point has in the two planes. Then $A'$ must be the point $B'$, and $B'$ to $C$ in the same sense as $A'$ to $C$. Hence the point $D'$ to $C$ in the same sense as $A'$ to $C$.

This $\pi'$ might also be got by drawing CB and joining its intersection $Y$ with the axis to $B'$. Then $C$ must be the point $B'$, and $B'$ to $C$ in the same sense as $A'$ to $C$. Hence the point $D'$ to $C$ in the same sense as $A'$ to $C$.

If the two projective planes $\pi$, $\pi'$ are parallel, through $A'$ and $B'$, and $B'$ and $C$, and if to one point in their common plane the same point corresponds, whether we consider the point as belonging to the first or to the second plane, then the same will happen for every other point—that is to say, to every point will correspond the same point in the first as in the second plane. In this case the figures are said to be in involution.

If the two projective planes $\pi$, $\pi'$ are parallel, through $A'$ and $B'$, and $B'$ and $C$, and if to one point in their common plane the same point corresponds, whether we consider the point as belonging to the first or to the second plane, then the same will happen for every other point—that is to say, to every point will correspond the same point in the first as in the second plane. In this case the figures are said to be in involution.
its corresponding line. Thus the lines AB and CD, and therefore also their point of intersection E, will coincide with their corresponding elements. The row AB has thus three points A, B, E coincident with their corresponding points, and is therefore identical with the line AB and therefore coincident with the corresponding line of the four points A, B, C, D, there are six lines such that each point in either coincides with its corresponding point. Every other point will thus have the six points in it which it cuts these, and therefore all the other lines of the plane other than their corresponding points. The proof of the second part is exactly the same. It follows—

§ 14. If two projective figures, which are not identical, lie in the same plane, then not more than three points are not in a line, or any four lines the corresponding points of which do not pass through a point, can be coincident with their corresponding points or lines.

If the figures are in perspective position, then they have in common one line, the axis, with all points in it, and one point, the centre of projection. Then no other point or line can therefore coincide with its corresponding point or line without the figures becoming identical.

It follows also that—

The correspondence between two projective planes is completely determined if there are given—either to four points in the one the corresponding four points in the other provided that no three of them lie in a line, or to any four lines the corresponding lines provided that no three of them pass through a point.

To show this we observe first that two planes π, π′ may be made projective in such a manner that four given points A, B, C, D in the one correspond to four given points A′, B′, C′, D′ in the other; for this is possible without involving A′B′, B′C′, C′D′, and to the intersection E of the former the point E′ where the latter meet. The correspondence between these rows is therefore determined, as we know three pairs of corresponding points. But this correspondence extends to four corresponding points, because we have already proved that if four corresponding points lies on a line then the points coincide. This case and also in the case of § 12 there is but one correspondence possible, let us suppose there were two, or that we could have in the plane π′ two figures which are each projective to the figure in π and among the points ABCD′ its corresponding to the points ABCD in π. Then these two figures will themselves be projective and have four corresponding points coincident. They are therefore identical by § 13.

The plane will be in perspective if one row coincides with its corresponding row. The line containing these rows will be the axis of projection.

As in this case every point on s coincides with its corresponding point in s′, the points are on the same line, that is, the two rows a, a′ are therefore perspective (G. § 30), and the lines joining corresponding points will meet in a point S. If r be any one of these lines it is evident that the points of r′ corresponding to those on r are then the points of a′K, then to the line AK corresponds A′K, or the ray r′ corresponds to itself. The points B, B′ in which r cuts another pair b, b′ of corresponding rows must therefore be corresponding points. Hence the lines AB and A′B′ are parallel, and therefore the points A, B coincide, and similarly all lines joining corresponding points in the two planes π and π′ meet in S; hence the planes are perspective.

The following proposition is proved in a similar way.

Two similar figures will be perspective if one pencil coincides with its corresponding one. The centre of these pencils will be the centre of perspective.

In this case the two planes must of course coincide, whilst in the first case this is not so.

§ 15. We shall now show that two parallel planes which are projective according to definition (§ 12) can be brought into perspective position, hence that the new definition is really equivalent to the old. We use the following property: If two coincident planes at w′ are perspective with S as centre, then any two corresponding rows are also perspective with S as centre. This therefore is true for the row j and j′ and for i and i′, of which i and j are the lines at infinity in S. If we then consider the points of j′ passing through the point w′ in the same plane S, and if these points coincide in a point K, then to the line AK corresponds A′K, or the ray r′ corresponds to itself. Hence also to the line BK corresponds B′K, or the ray r′ corresponds to itself. Hence also to the line BK corresponds B′K, or the ray r′ corresponds to itself. The rays forming the lines B1 and B′1 meet in a point S; hence the planes are perspective.

Conversely, if two projective planes are placed one on the other, then as soon as the lines j and j′ are parallel the two points T and T′ can be found by joining corresponding points in the row j. If j coincides with j′, then the line at infinity in the plane S is called a plane at infinity, and therefore the two points T and T′ coincide. If this point at infinity is called A as a point in π and B′ as a point in π′, then the point A′ will lie on i′ and B on j′, so that the line AA′ passes through T′ and BB′ through T. These two lines are parallel. If then the plane w′ be moved parallel to itself, and then the two planes will coincide with each other, and with them will coincide the lines AB and A′B′.

This line and similarly every line through T will thus now coincide with its corresponding line. The two planes are therefore according to the last theorem in § 14 in perspective position.

It will be noticed that the plane π′ may be placed on π in two different ways, viz. if we have placed π′ on π we may take it off and turn it over in space before we bring it back to π, so that what was its upper becomes now its lower face. For each of these positions will in the two planes π, π′ have corresponding rows and lines which are coincident with their corresponding one, then the planes will be perspective.

This agrees with the fact that two perspective planes in space can be made coincident by turning one about their axis in two different ways.

In the reasoning employed it is essential that the lines j and j′ are finite. If one lies at infinity, say j, then i and j will coincide, hence their corresponding lines j′ and j′′ will coincide; that is, i′ also lies at infinity. Hence they coincide with the infinity in the plane π′ corresponding lines. If the planes are now made coincident and perspective, then it may happen that the lines at infinity correspond for point, or can be made to do so by turning the one plane in itself. In this case the line at infinity is the axis, whilst the curve may be a finite point. This gives similar figures (see § 16). In the other case the line at infinity corresponds to itself without being the axis; the lines joining corresponding points therefore all coincide with it, and the curve will be a finite line. This gives parallel projection (see § 17). For want of space we do not show how to find in these cases the perspective position, but only remark that in the first case any pair of corresponding directions intersects at infinity in π′, whilst in the other case there is a pencil of parallels in π′ such that any one line of these can be made to coincide point for point with its corresponding line in π′, and thus serve as the axis of perspective projection. Two figures in perspective position by first placing any point A′ on its corresponding point A and then turning π′ about this point till lines joining corresponding points are parallel.

§ 6. No plane can be at infinity if every line in it is parallel to its corresponding line. Corresponding angles are therefore equal. The figures are similar, and (§ 10) the ratio of similitude of any two corresponding rows is constant.

Two similar figures are perspective if they are said to be similarly situated, and the centre of projection is called the centre of similitude. To place two similar figures in this position, we observe that their lines at infinity will coincide as soon as both figures are parallel to their corresponding rows, which is necessarily the case if the figures are identical. They are projective, and hence in general not more than two points on one will coincide with their corresponding points in the other (G. § 34). To make them identical it is either sufficient to make their plane till three lines in one are parallel to their corresponding lines in the other, or it is necessary before this can be done to turn the one plane over in space. It can be shown that in the former case all lines are, or no line is, parallel to its corresponding line.

In the following cases the lines are parallel at right angles to each other, which have the property that each line in either direction is parallel to its corresponding line. We also see that—

Two similar figures, three lines, of which no two are parallel, are parallel respectively to their corresponding lines, then every line has this property and the two figures are similarly situated; or

Two similar figures are similarly situated as soon as two corresponding points coincide.

If two similar figures are perspective without being in the same plane, their planes must be parallel as the axis is at infinity. Hence—

Any plane figure is projected from any centre to a parallel plane and similar figure.

If two similar figures are similarly situated, then corresponding points may either be on the same or on different sides of the centre. If, besides, the ratio of similitude is unity, then corresponding points coincide.

If we then consider the two figures π and π′ placed one on the other so that plane π coincides with plane π′, then the corresponding two figures will be identical. In the second case they will be identically equal but not coincident. They can be made to coincide by turning one in its plane through two right angles about the axis of perspective projection. If we then notice this figure as seen at once, and they are said to be symmetrical with regard to the point S as centre. If the two figures be considered as part of one, then this is said to have a centre. Thus regular polygons of an even number of sides and parallelograms have each a centre, which is a point of symmetry.

§ 17 Parallel Projection.—If, instead of the axis, the plane is moved to infinity, all the projecting rays will be parallel, and we get what is called parallel projection. This case is of particular importance if the point at infinity passes through the centre and therefore corresponds to itself but not point for point as in the case of similar figures. To any point A at infinity corresponds therefore a point A′ also at infinity but different from the first. Hence to parallel lines meeting at A′ correspond parallel lines of another direction meeting at A. Further, in any two corresponding rows the two points at infinity are corresponding points; hence the rows are similar.

This gives the principal properties of parallel projection—

—Parallel lines correspond parallel lines; or
To a parallelogram corresponds a parallelogram.
The correspondence of parallel projection is completely determined as soon as for any parallelogram in one figure the corresponding parallelogram in the other has been selected, as follows from the general case of the parallelogram (§ 10).
The ratio of similitude for these rows changes with the direction:

If a row is parallel to the axis, its corresponding row, which is also parallel to the axis, will be equal to it, because any two pairs of corresponding points, AA' and BB', fall on a parallelogram.

Another important property is the following:
The areas of corresponding figures have a constant ratio.

We prove this first for parallelograms. Let ABCD and EFGH be any two parallelograms in \( \pi \), \( AB'CD' \) and \( EF'GH' \) the corresponding parallelograms in \( \pi' \). Then to the parallelogram KL'M'N' formed by the lines AB, CD, and EF, GH will correspond a parallelogram KL'M'N' formed in exactly the same manner. As ABCD and KL'M'N' are between the same parallels their areas are as the bases. Hence

\[
\text{ABCD} \sim \text{AB'C'D'} \text{ and similarly } \text{KLMN} \sim \text{KL'M'N'}
\]

But \( AB/KL = AB'/KL', \) as the rows \( AB \) and \( AB' \) are similar. Hence

\[
\text{ABCD} \sim \text{KLMN} \sim \text{AB'C'D'} \text{ and similarly } \text{EFGH} \sim \text{KL'M'N'}
\]

This proves the theorem for parallelograms and also for their halves, that is, for any triangles. As polygons can be divided into triangles the truth of the theorem follows at once for them, and end is extended (by the method of exhaustion) to areas bounded by curves by inscribing polygons in, and circumscribing polygons about, the curves.

Just as (G, § 8) a segment of a line is given a sense, so a sense may be given to an area. This is done as follows. If we go from the boundary of an area, the latter is either to the right or to the left. If we turn round and go in the opposite sense, then the area will be to the left if it was first to the right, and vice versa. If we give the boundary a definite sense, and go in this sense, then the area is said to be either of the one or of the other sense according as the area is to the right or to the left. The area is generally said to be positive if it is to the left.

The sense of the boundary is indicated either by an arrowhead or by the order of the letters which denote points in the boundary. Thus, if A, B, C denote the vertices of a triangle, then ABC shall denote the area in magnitude and sense, the sense being fixed by going round the triangle in the order A, B, C, and is to be read as ABC or \( \text{ABC} \). It will then be seen that A'BC' and ABC denote the same area but with opposite sense, and generally \( \text{ABC} = \text{BAC} = - \text{ABC} = - \text{BCA} \); that is, an interchange of two letters changes the sense. Also, if A and A' are two points on opposite sides of and, equidistant from, the line BC, then \( \text{ABC} = - \text{A'BC} \).

Taking account of the sense, we may make the following statement:

If A' are two corresponding points, if the line AA' cuts the axis in B, and if C is any other point in the axis, then the triangles ABC and A'BC are corresponding, and

\[
\text{ABC} \sim \text{A'BC} \text{ and } \text{AB} = - \text{A'B}
\]

or The constant ratio of corresponding areas is equal and opposite in the ratio in which the axis divides the segments joining two corresponding points.

§ 18. Several special cases of parallel projection are of interest.

Orthographic Projection.—If the two planes \( \pi \) and \( \pi' \) have a definite position in space, and if a figure in \( \pi \) is projected to \( \pi' \) by rays perpendicular to this plane, then the projection is said to be orthographic. If in this case the plane \( \pi \) is turned till it coincides with \( \pi' \) so that the figures remain perspective, then the projection rays will be perpendicular to the axis. Every pair of corresponding points, and hence all corresponding points, will remain during the turning, perpendicular to the axis.

The constant ratio of the area of the projection to that of the original figure in this case, the cosine of the angle between the two planes \( \pi \) and \( \pi' \), as will be seen by projecting a rectangle which has its base in the axis.

Orthographic projection is of constant use in geometrical drawing.

Shear.—If the centre of projection be taken at infinity on the axis, then the projecting rays are parallel to the axis; hence corresponding points will be equidistant from the axis. In this case, therefore, areas of corresponding figures will be equal.

If A, A' and B, B' (fig. 7) are two pairs of corresponding points on the same line, parallel to the axis, then, as corresponding segments parallel to the axis are equal, it follows that \( \text{AB} = \text{A'B'} \) (hence also \( \text{A'B'} \)).

If these points be joined to any point O on the axis, then AO and A'O will be corresponding lines; they will therefore be cut by any line parallel to the axis in corresponding points. In the figure therefore \( \text{CC'} \) and also \( \text{DD'} \) be two pairs of corresponding points and \( \text{CC'} = \text{DD'} \). As the ratio \( \text{CC'}/\text{AA} \) equals the ratio of the distances of C and A from the axis, therefore—

Two corresponding figures may be got one out of the other by moving all points in the one parallel to a fixed line, the axis, through distances proportional to their own distances from the axis. Points in a line remain hereby in a line.

Such a transformation of a plane figure is produced by a shearing stress in any section of a homogeneous elastic solid. For this reason Kelvin gave it the name of shear.

A shear of a plane figure is determined if we are given the axis and the distance through which one point has been moved; for in this case the axis, the centre, and a pair of corresponding points are given.

§ 19. Symmetry and Skew-Symmetry.—If the centre is not on the axis, and if corresponding points are at equal distances from it, they must be on opposite sides of it. The figures will be in inverse order (§ 11). If the direction of the projecting rays is said to be conjugate to the axis.

The conjugate direction may be perpendicular to the axis. If the line joining two corresponding points A, A' cuts the axis in B, then the axis of the plane BC, BB' will be said to be skew-symmetrical to the axis, which itself is called an axis of skew-symmetry. If the two figures are considered as one then one is said to be symmetrical with regard to an axis, and is said to have an axis of symmetry or simply an axis. Every diameter of a circle, an axis of symmetry, and a line through the middle-point of a rhombus are axes of the figures to which they belong.

In the more general case where the projecting rays are not perpendicular to the axis, the axis may be imagined as a line in which may be called skew-symmetry. It can be got from symmetry by giving the whole figure a shear. It will also be easily seen that we get skew-symmetry if we first form a shear to a given figure and then separate it from its shear by folding it over along the axis of the shear, which thereby becomes an axis of skew-symmetry.

Skew-symmetrical and therefore also symmetrical figures have the following properties:

Corresponding areas are equal, but of opposite sense. Any two corresponding lines are harmonic conjugates with regard to the axis and a line in the conjugate direction.

If the two figures be again considered as one whole, this is said to be skew-symmetrical. That is to say, there is an axis of skew-symmetry, the line on which it stands having the conjugate direction, the other sides being conjugate lines. From this it follows, for instance, the theorem that the line of centres is a line of intersection of the planes.

For two median lines will be corresponding lines with regard to the third as axis, and must therefore meet on the axis.

An axis of skew-symmetry is generally called a diameter. Thus every diameter of a conic is an axis of skew-symmetry, the conjugate direction being the direction of the chords which it bisects.

§ 20. We state a few properties of these figures useful in mechanics, but we omit the easy proofs:

If a plane has an axis of skew-symmetry, then the mass-centre (centre of mean distances or centre of inertia) lies on it.

If a figure undergoes a shear, the mass-centre of the area remains the mass-centre; and generally—

In parallel projection the mass-centres of corresponding areas (or of groups of points, but not of curves) are corresponding points.

The moment of inertia of a plane figure does not change if the figure undergoes a shear in the direction of the axis with regard to which the figures are in perspective, because area is preserved.

If a figure has an axis of skew-symmetry, then this axis and the conjugate direction are conjugate diameters of the momental ellipse for every point in the axis.

If a figure has an axis of symmetry, then this is an axis of the momental ellipse for every point in the axis.

The truth of the last propositions follows at once from the fact that the product of inertia for the lines in question vanishes.

It is of interest to notice how a great many propositions of Euclid are only special cases of projection. The theorems Eucl. I. 35 and about parallelograms or triangles on equal bases and between the same parallels are examples of shear, whilst I. 43 gives a case of
skew-symmetry, hence of involution. Figures which are identically equal are of course projective, and they are perspective when placed so that they have an axis or a centre of symmetry (cf. Hénocq, Elementary Geometry, Congruent Figures). In this case again the correspondence is such that the points of one cone and the tangents at two of them are projected to three arbitrarily selected points and the tangents at two of them on the other.

If and are any two cones, then we have to prove that we can project to such a manner that three points on one cone and the tangents at of two of them is projected to three points on another and the tangents at two of them on the other.

The projection is determined as soon as the projections of any four points or four lines are selected, we cannot project any five points of to any five arbitrarily selected points on a line. If we select three points on and two tangents at of two of them, then the plane of may be projected to the plane of in such a manner that the point of the line at infinity on the other, whilst the projection will be an ellipse. These curves appear thus as sections of a circular cone, for in case that the two planes of projection are separated the rays projecting the circle form such a cone.

If we take any point in the plane of a conic as centre, the polar of this point as axis of projection, and any two points in which a line through cuts the conic as corresponding points, then these will be corresponding points with regard to the centre and the axis, hence every point on the conic into that point on the conic in which the line at infinity on the other, whilst the projection will be an ellipse.

Two conics which cut the line at infinity in the same two points are similar figures and similarly situated—the centre of similitude being in general a point on the line at infinity. They form so far as geometry is concerned, a single figure.

To prove this, we take the line at infinity and the asymptotes of one as corresponding to the line at infinity and the asymptotes of the other, and besides a tangent to the first as corresponding to a tangent to the other. We then have the threes of infinity of the lines which will correspond to itself point for point; hence the figures will be similar and similarly situated.

§ 22. Areas of Parabolic Segments.—One parabola may always be considered as a parallel projection of another in such a manner that any two points, and on the one correspond to any two points, and on the other; that is, the points, and points on the one may be made to correspond respectively to the points, and points on the other correspond to itself point for point; hence the figures will be similar and similarly situated.

If then (Fig. 8) we join the points to the point in a parabola, then this line will be bisected at by the parabola (G. § 74), and the tangent at will be parallel to . Let this tangent cut in and in , then by the last property of the projective relation, and will correspond, and will be the parabola cut off by the chords and . If (AB) denotes the area of the segment cut off by the chord the area of the parabola we have therefore

\[
\text{Combining both equations, we have}
\]

\[
AB = m (AB) = (A'B')C'
\]

But we have also \(AB = \frac{1}{2} AB\), and \(AB = BF = \frac{1}{2} AB\); hence

\[
\frac{1}{2} AB = m (1 - \frac{1}{2} m) \text{ ABC}, \quad m = \frac{1}{2}.
\]

The area of a parabolic segment equals two-thirds of the area of the triangle formed by the chord and the tangents at the end points of the chord.

§ 23. Elliptic Areas.—To consider one ellipse a parallel projection of another we may establish the correspondence as follows. If any two parabolas have any pair of conjugate diameters of the one and the other, then these may be made to correspond to each other, and the correspondence will be completely determined if the parabola projected from the other is the projection of the tangents at to , , , (§§ 17 and 21). As the projection of the first conic has the four points , , , and the tangents at these points in common with the second, the two ellipses are projective to each other. Then the corresponding points are, and do those of the parabolas and . Hence

The area of an ellipse has a constant ratio to the area of any inscribed parallelogram whose diagonals are conjugate diameters, and also to every circumscribed parallelogram whose sides are parallel to conjugate diameters.

It follows at once that—

All parallelograms inscribed in an ellipse whose diagonals are conjugate diameters have equal area.

Al all parallelograms circumscribed about an ellipse whose sides are parallel to conjugate diameters are equal in area.

If , , are the length of the semi-axes of the ellipse, then the area of the circumscribed parallelogram will be and of the inscribed one .

For the circle of radius the inscribed parallelogram becomes the square of area and the circle has the area \(\pi r^2\); the constant ratio of the ellipse to the inscribed parallelogram has therefore also the value \(\pi\). Hence

The area of an ellipse equals \(\pi\).

§ 24. Projective Properties.—The properties of the projection of one figure depend principally upon the position of the figures and the centre of projection, but principally upon the properties of the given figure. Points in a line are projected into points in a line, harmonic points into harmonic points, a conic into a conic; and parallel lines are not projected into parallel lines since, if lines are the projections of equal segments or angles equal again, there are then some properties which remain unaltered by projection, whilst others change. The former are called projective or descriptive, the latter metrical properties of figures, because the latter depend on measurement.

To a triangle and its median lines correspond a triangle and three lines which meet in a point, but which as a rule are not median lines of the other.

In this case, if we take the triangle together with the line at infinity, we get as the projection a triangle and some other line which cuts the sides and of the triangle at and respectively. If now take on the harmonic conjugate of to and ; but at the same time the triangle of the lines will be the projections of the lines in the given figure. Hence these lines must meet in a point.

As the third and fourth line we may take any four given lines, because any four lines may be projected into any four given lines (§ 14). This gives a theorem:

If each vertex of a triangle be joined to that point in the opposite side of the vertex, with regard to the vertices, the harmonic conjugate of the point in which the side is cut by a given line, then the three lines thus obtained meet in a point.

We get thus out of the special theorem about the median lines of a triangle the following theorem. But before this could be done we had to add the line at infinity to the lines in the given figure.

In a similar manner a great many theorems relating to metrical properties can be generalized by taking the line at infinity or points at that of any line in a projective relation. Conversely special cases relating to measurement are obtained by projecting some line in a figure of known properties to infinity. This is true for all properties relating to parallel lines or to bisection of segments, and not immediately for angles. It is, however, possible to establish for every metrical relation the corresponding projective property. To do this it is necessary to consider imaginary elements. These have originally been introduced into geometry by aid of the complex number which is so convenient for cases where imaginary quantities constantly occur as roots of equations.

Their introduction into pure geometry is due principally to Poncelet, who by the publication of his great work Traité des Propriétés Projectives des Figures, 1822, extended the whole of projective geometry in its widest sense. Monge had considered parallel projection and had already distinguished between permanent and accidental properties of figures, the latter being those which depend merely on the accidental position of one part to another. Thus in projecting two circles which lie in different planes it
depends on the accidental position of the centre of projection whether the projections be two conics which do or do not meet. Poncelet introduced the principle of continuity in order to make theorems general and independent of those accidental positions which might arise through the conics being real or imaginary roots. But the correctness of this principle remained without a proof. Von Staudt has, however, shown how it is possible to introduce imaginary elements by purely geometrical reasoning, and we shall now try to give the reader some idea of his theorems.

§ 25. Imaginary Elements.—If a line cuts a curve and if the line be moved, turned for instance about a point in it, it may happen that two of the points of intersection approach each other till they coincide. The line then becomes a tangent. Or if the line is still further moved in the same manner it separates from the curve and two points of intersection are lost. Thus in considering the relation of a line to a conic we have to distinguish three cases—the line cuts the curve in two points, or else it is a tangent, or else it is not at all connected with it. This is quite analogous to the fact that a quadratic equation with one unknown quantity has either two, one, or no roots. But in algebra it has long been found convenient to express this difference by introducing the imaginary elements. The case in which the line and curve are not connected with each other but these may be either both real and different, or equal, or they may be imaginary. In geometry a similar mode of expressing the fact above stated is not less convenient.

When a line has as its points of intersection two in common with a conic, but these are either distinct, or coincident, or invisible.

The word imaginary is generally used instead of invisible; but, as the points have nothing to do with imagination, we prefer the word imaginary because it is a general name which contains each of the others.

Invisible points occur in pairs of conjugate points, for a line loses always two visible points of intersection with a curve simultaneously. This is analogous to the fact that an algebraical equation with two unknown quantities and one unknown quantity has either two, one, or no roots, and that the one and the other reduce to the same algebraical equation.

Invisible points occur in pairs of conjugate points, for a line loses always two visible points of intersection with a curve simultaneously. This is analogous to the fact that an algebraical equation with two unknown quantities and one unknown quantity has either two, one, or no roots, and that the one and the other reduce to the same algebraical equation. For instance, the line cuts the conic in two real points, or else in two points which are imaginary roots of the equation of the curve, or else it is not connected with the curve at all. This is quite analogous to the fact that a quadratic equation with one unknown quantity has either two, one, or no roots. But in algebra it has long been found convenient to express this difference by introducing the imaginary elements. The case in which the line and curve are not connected with each other but these may be either both real and different, or equal, or they may be imaginary. In geometry a similar mode of expressing the fact above stated is not less convenient.

Now any two pairs of conjugate points determine an involution (G., § 77 [6]).

Hence any point-pair, whether real or invisible, is completely determined by the points of the involution, which has given the point-pair as foci and may therefore be replaced by them.

Two pairs of invisible points are thus said to be identical if, and only if, they are the foci of the same involution.

We know (G., § 52) that a conic determines on every line an involution whose conjugate points are conjugate poles with respect to the conic—that is, that either lies on the polar of the other. This line is then called the polar line of the involution. The foci are the points of contact of the line and the conic are the invisible foci of the involution in question. If we now take the limits of the involution, we have a curve of which one is of the opposite sign to the other; and a point given as the intersection of a conic and a line as that of drawing a conic which determines a given involution on the line, we have in it a form in which it is independent of the accidental circumstances of the involution. This is the solution of the problem, as we shall now show.

§ 26. We have seen (§ 21) that a conic may always be projected into itself by taking any point S as centre and its polar as axis of projection. The points B and B' are points of intersection of the line s cuts the conic. If then (fig. 9) A, A', B, and B' are pairs of corresponding points so that the lines AA' and BB' pass through S, then the lines AB and AB', as corresponding lines, will meet at a point R on the axis, and the points AB, A'B', and another point R' on the axis. These points R, R' are conjugate points in the involution which the conic determines on the line s, because the triangle RSR' is a polar triangle (G., § 62), so that R' lies on the polar of R.

This gives a simple means of determining for any point Q on the line s its conjugate point Q'. We take any two points A, A' on the line s, find the point B, which is on a line through S, join Q to A by a line cutting the conic again in C, and join C to A'. This line will cut s in the point Q' required.

To draw some conic which shall determine on a line s a given involution, we have here to reconstruct the fig. 9, having given on the line s an involution. Let Q, Q' and R, R' (fig. 9) be two pairs of conjugate points in this involution. We take any two points A, A' on the line B and join it to R and R', and another point C and Q and Q'. Let BR' become QQ' intersect at A, and B'Q' intersect at C. Let now a point P be moved along s its conjugate point P' will also move and the two points will pass through two projective rows. The two rays AP and AP' will therefore describe projective pencils, and the intersection of corresponding rays will lie on a conic which passes through A, A', B, and C. This conic determines on s the given involution.

Of these four points not only B and C but also the point A may be taken arbitrarily, for if A, B, C are given, the line AB will cut s in the point Q, and the points Q' and Q' will be determined by and the conic will cut s in the point Q'. In the same way the line CA' will cut s in some point Q'. Its conjugate point Q' to we join to C. The line CQ' will cut BR' in a point A', and then AA' will pass through the point B and find the point B'. Then BB' will also pass through the point S, which is thus found. At the same time five points A, B, C, A', B' on the conic have been found, so that the conic is completely known when it determines on line s the given involution. Hence—Three through points we can always draw one conic, and one only, which determines on a given line a given involution, all the same whether the involution has real, coincident or invisible foci.

In the last case the theorem may now also be stated thus—It is always possible to draw a conic which passes through three given real points and through two invisible points which any other conic has in common with a line.

§ 27. The above theory of invisible points gives rise to a great number of interesting theorems, which we state a few.

The theorem at the end of § 21 may now be stated thus—Any two conics are similar and similarly situated if they cut the line at infinity in the same two points—real, coincident or invisible.

Any two parabolas are similar; and they are similarly situated as soon as their axes are parallel.

The involution which a circle determines at its centre is circular (G., § 77 [6]) and is perpendicular to it, or its line of centre.

This will be cut by the line at infinity in an involution which has the following property: The lines which join any finite point to two conjugate points in the involution are at right angles to each other. Hence all the lines infinite to the conjugate line are the same involution on the line at infinity. The latter is therefore called the circular involution on the line at infinity; and the involution which a circle determines at its centre is called the circular involution of the given circle.

All circles may be considered as passing through the same two points at infinity.

These points are called the circular points at infinity, and by Professor Cayley the absolute in the plane. They are the foci of the circular involution in the line at infinity.

(Conic Involution—Every involution through the circular points is a circle; because the involution at its centre is circular, hence conjugate diameters are at right angles, and this property only circles possess.

We now see why we can draw always one and only one circle through any three points; these three points together with the circular points at infinity are five points through which one conic can only be drawn.

Any two circles are similar and similarly situated because they have the same point at infinity (§ 21).

Any two concentric circles may be considered as having double contact at infinity, because the lines joining the common centre to the circular points at infinity are tangents to both circles at the same tangent to the line at infinity is the polar of the centre.

Any two lines at right angles to one another are harmonic conjugates with regard to the rays joining their intersection to the circular points, because these rays are the focal rays of the circular involution at the intersection of the given circles.

To bisect an angle with the vertex A means (G., § 23) to find two rays through A which are harmonic conjugates with regard to the
lacks of the angle and perpendicular to each other. These rays
are therefore harmonic with regard to the limits of the given angle
and with regard to the rays through the circular points. Thus
perpendicularity and bisection of an angle have been stated in a
particular form.
It must not be forgotten that the circular points do not exis-
t at all; but to introduce them gives us a short way of making
a statement which would otherwise be long and cumbersome.
We can generalize any theorem relating to geometrical
properties. For instance, the simple fact that the chord of a circle
is touched by a concentric circle at its mid point proves the theorem:—
If two cosines have double contact, then the points where any tangent
touches them are harmonic with regard to the limit of contact and the point where the tangent cuts the chord of contact.

(O. H.)

PROKOP, the name of two of the most prominent Hussites
generals.

1. Prokup, surnamed "Veliky" (the great) or "Holy" (the bald), was a marvellous ukrasi, priest who belonged to an
eminent family of citizens of Prague. Though a priest
and continuing to officiate as such, he became the most prominent
leader of the advanced Hussite or Taborite forces during the
latter part of the Hussite wars. He was not indeed the immediate
successor of Žižka as leader of the Taborites, as has been fre-
quently stated, but he commanded the forces of Tabor when they
obtained their great victories over the Germans and Romanists
at Usti nad Labam (Aussig) in 1426 and Domažlice (Taus) in
1431.
He also acted as leader of the Taborites during their frequent
incursions into Hungary and Germany, particularly when in 1429 a vast Bohemian army invaded Saxony and the
territory of Nuremberg. The Hussites, however, made no
attempt permanently to conquer German territory, and on the
6th of February 1430 Prokop concluded at Kulmbach a treaty
with Frederick of Brandenburg, burggrave of Nuremberg, by
which the Hussites engaged themselves to leave Germany.
When the Bohemians entered into negotiations with Sigismund
and the Council of Basel and, after prolonged discussions,
resolved to send an embassy to the council, Prokop the Great
was the most prominent member of this embassy, which reached
Basel on the 4th of January 1433. When the negotiations
there for a time proved resultless Prokop with the other envoys
returned to Bohemia, where new internal troubles broke out.
A Taborite army led by Prokop the Great besieged Plzeň, which
was then in the hands of the Romanists. The discipline in the
Hussite camp had, however, slackened in the course of
prolonged warfare, and the Taborites encamped before Plzeň
revolted against Prokop, who therefore returned to Prague.
Probably encouraged by these dissensions among the men of Tabor
the Bohemian nobles, both Romanist and ukrasi, formed a league for the purpose of opposing democracy and,
through the victories of Tabor had acquired great strength in the
Bohemian towns. The struggle began at Prague. Aided
by the nobles, the citizens of the old town took possession of
the more democratic new town, which Prokop unsuccessfully
attempted to defend. Prokop now called to his aid Prokop the
"Lesser," who had succeeded him in the command of the Taborite
army before Plzeň. They jointly retreated eastward from
Prague, and their forces, known as the army of the towns, met
at Lipan, between Kourim and Kolin, the army of the nobles
(May 30, 1434). The Taborites were decisively defeated, and
Prokop the Great perished in this battle.

2. Prokop the "Lesser," or Prokupek (the Bohemian diminutive of the word Prokop), was one of the greatest Hussite
generals. Little is known of his early life. He was part in all
the later campaigns of Prokop the Great in Germany, and suc-
cceeded him as commander of the Taborite army that besieged
Plzeň. After the formation of the confederation of the nobles
he was recalled by Prokop the Great, with whom he shared
the command of the army of the towns at the fatal battle of
Lipan, in which he also perished.

See Count Lutzow, Bohemia: A Historical Sketch; Palacky, History
of Bohemia; Toman, Hussite Válečníci (Hussite Warfare).

PROKOPOVICH, THEOFAN (1651–1736), Russian archbishop
and statesman, one of the ablest coadjutors of Peter the Great,
was sprung from a merchant family. He brilliantly distinguished
himself at the Orthodox academy of Kiev, subsequently com-
pleting his education in Poland (for which purpose he turned
Uniate), and at Rome in the College of the Propaganda. Primed
with all the knowledge of the West, he returned home to seek
his fortune, and, as the Orthodox monk, became one of the pro-
fessors at, and subsequently rector of, the academy of Kiev.
He entirely reformed the teaching of theology there, substituting
the historical method of the German theologians for the anti-
quated Orthodox scholastic system. In 1709 Peter the Great,
while passing through Kiev, was struck by the eloquence of
Prokopcovich in a sermon on the "most glorious victory," i.e.
Poltava, and in 1716 summoned him to Petersburg. From
henceforth it was Theofan's duty and pleasure to explain
the new ideas and justify the most alarming innovations from the
pulpit. So invaluable, indeed, did he become to the civil
power, that, despite the determined opposition of the Russian
clergy, who regarded "the Light of Kiev" as an interloper
and semi-heretic, he was rapidly promoted, becoming, in 1718,
bishop of Pskov, and finally, in 1724, archbishop of Novgorod.
As the author of "the spiritual regulation" for the reform of
the Russian Church, Theofan must, indeed, be regarded as the
creator of the "spiritual department" superseding the patri-
archate, and better known by its later name of "the holy
synod," of which he was made the vice-president. Penetrated
by the conviction that ignorance was the worst of the inveterate
evils of old Russia, a pitiless enemy of superstition of every
sort, a reformer by nature, overflowing with energy and resource,
and with a singularly lucid mind armed at all points by a far-
reaching erudition, Prokopcovich was the soul of the reforming
party after the death of Peter the Great. To him also belongs
the merit of liberating Russian preaching from the fetters of
Polish, turbidity, and affectation by introducing popular
themes and a simple style into Orthodox pulpul eloquence.

See I. Chistovitch, Theofan Prokospovich and his Times (Rus.;
Petersburg, 1868); P. Morozov, Theofan Prokospovich as a Writer
(Rus.; Petersburg, 1880).

PROLEGOMENON (Gr. for "that which is said beforehand,
προλογέω, to speak, say before), a preface or introduction to
a book, especially a preliminary introductory essay to a learned
work, or a treatise which serves as a general survey or intro-
duction to the study of some subject or as a special survey of
the subject. The word is more often used in the plural.

PROLETARIAT, or PROLETARIATE, a term borrowed from the
French and used collectively of those classes of a political
community who depend for their livelihood on their daily labour,
whether wage-earning or non-wage-earning. The class as a whole
is characterized by the absence of ownership of the means of
production. It is of frequent use by those social reformers
who base their theories on the supposed antagonism of capital
and labour. The Latin proletarius, from which the word was
formed, was the name given to the body of citizens possessed
of no property and who therefore served the state with their
children (proles, offspring). This division of the members
of the state was traditionally ascribed to Servius Tullius.

PROLOCUTOR, one who speaks for others (Lat. pro, for,
and loqui, to speak); specifically the chairman of the lower house
of convocation in the two provinces of the Church of England,
who presides in that house and acts as representative and
spokesman in the upper house. He is elected by the lower
house, subject to the approval of the metropolitan. (See
CONVOCATION.)

PROLOGUE (from Gr. πρόθες, before, and λόγος, a word,
a prefatory piece of writing, usually composed to introduce a
drama. The Greeks use a word προλογίς, which included
the modern meaning of the prologue, but was of wider signifi-
cance, embracing any kind of preface, like the Latin praefatio.
In Attic Greek drama, a character in the play, very often a
deity, stood forward or appeared from a machine before the
action of the play began, and made from the empty stage such
statements as it was necessary that the audience should hear,
in order that they might appreciate the ensuing drama. It was
the early Greek custom to dilate in great detail on everything
that had led up to the play, the latter being itself, as a rule,
merely the catastrophe which had inevitably to ensue on the facts related in the prologue. The importance, therefore, of the prologue in Greek drama was great; it sometimes took the place of a romance, to which, or to an episode in which, the play itself succeeded. It is believed that the prologue in this form was practically the invention of Euripides, and with him, as has been said, it takes the place of "an explanatory first act." This may help to modify the objection which criticism has often brought against the Greek prologue, as an impertinence, a useless growth prefixed to the play, and standing as a barrier between us and our enjoyment of it. The point precisely is that, to an Athenian audience, it was useful and pertinent, as supplying just what they needed to make the succeeding scenes intelligible. But it is difficult to accept the view that Euripides invented the plan of producing a god out of a machine to justify the action of deity upon man, because it is plain that he himself disliked this interference of the supernatual and did not believe in it. He seems, in such a typical prologue as that to the Hippolytus, to be accepting a conventional formula, and employing it, almost perversely, as a medium for his ironic rationalism.

Many of the existing Greek prologues may be later in date than the plays they illustrate, or may contain large interpolations. On the Latin stage the prologue was often more elaborate than it was in Athens, and in the careful composition of the poems which Plautus prefixes to his plays we see what importance he gave to this portion of the entertainment; sometimes, as in the preface to the Rudens, Plautus rises to the height of his genius in his adroit and romantic prologues, usually placed in the mouths of persons who make no appearance in the play itself. Mollière revived the Plautian prologue in the introduction to his Amphitryon. Racine introduced Piety as the speaker of a prologue which opened his choral tragedy of Esther. The tradition of the ancients vividly affected our own early dramatists. Not only were the mystery plays and miracles of the middle ages begun by a homily, but when the drama in its modern sense was inaugurated in the reign of Elizabeth, the prologue came with it, directly adapted from the practices of Euripides and Terence. Sackville, Lord Buckhurst, prepared a sort of prologue in dumb show for his Gorbeaux of 1592; and he also wrote a famous Induction, which is, practically, a prologue, to a miscellany of short romantic epics by diverse hands. In the Elizabethan drama the prologue was very far from being universally employed. In the plays of Shakespeare, for instance, it is an artifice which the poet very rarely introduced, although we find it in Henry V. and Romeo and Juliet. Sometimes the Elizabethan prologue was a highly elaborated poem; in 1603 a har- binger recited a sonnet on the stage, to prepare the audience for Heywood's A Woman Killed with Kindness. Often the prologue was a piece of blank verse, so obscure and complicated that it is difficult to know how its hearers contrived to follow it; such are the prologues of Chapman. Among Elizabethans prologues the most ingenious and interesting are those of Ben Jonson, who varied the form on every occasion. For instance, in The Poetaster (1603), Envy comes in "as Prologue," and speaks a long copy of verses, only to be turned off the stage by an armed figure, who states that he is the real prologue, and proceeds to spout more verses. Jonson's introductions were often recited by the "stage-keeper," or manager. Beaumont and Fletcher seem to have almost wholly dispensable with prologues, and the form was far from being universal. Even at the Restoration, when it became de rigueur. The prologues of the last thirty years of the 17th century were always written in rhymed verse, and were generally spoken by a principal actor or actress in the ensuing piece. They were often, in the hands of competent poets, highly finished essays on social or literary topics. For instance, the famous prologue to Dryden's A wen–

sebe (1675) is really a brief treatise on fashions in versification. Throughout the 18th century the prologue continued to flourish, but went out of vogue in the early part of the 19th.

See also Enprologue.

PROME, a district in the Pegu division of Lower Burma, with an area of 2915 sq. m. and a population (1901) of 365,804. It occupies the whole breadth of the valley of the Irrawaddy, between Thayetmyo district on the north and Henzada and Tharrawaddy districts on the south, and originally extended as far as the frontier of Independent Burma, but in 1870 Thayetmyo was formed into an independent jurisdiction. There are two mountain ranges in Prome, which form respectively the eastern and western boundaries. The Arakan Yomas extends along the whole of the eastern side, and that portion of the district lying on the right bank of the Irrawaddy is broken up by thickly wooded spurs running in a south-easterly direction, the space for cultivation being but limited and confined, the parts adjacent to the river. On the eastern side lies the Pegu Yomas, and north and north-east of the district its forest-covered spurs form numerous valleys and ravines, the torrents from which unite in one large stream called the Na-weng River. The most important of the plains lie in the south and south-west portions of Prome, and extend along the whole length of the railway that runs between the towns of Paukâlê and Prome; they are mostly under cultivation, and those in the south are watered by a series of streams forming the Myit-ma-kha or upper portion of the Hlaing. There are in addition large tracts of land covered by tree-jungle which are available for cultivation. The principal river is the Irrawaddy, which intersects the district from north to south; next in importance are the Tha-ni and its tributaries and the Na-weng system of rivers. In the hills near the capital the soil is of Tertiary formation, and in the plains it is an alluvial deposit. The climate is much milder than other districts in Lower Burma, the annual rainfall being about 48 in. The temperature ranges from about 100° in June to 60° in January. The staple crop is rice, but some cotton and tobacco are grown, while the custard apples are famous. Sericulture is extensively carried on by a special class. The forests yield teak and cutch, cotton and silk-weaving are important industries; there are also manufactures of ornamental boxes, coarse brown sugar and cutch.

The early history of the once flourishing kingdom of Prome, like that of the other states which now form portions of Burma, is veiled in obscurity. After the conquest of Pegu in 1758 by Alompra, the founder of the last dynasty of Ava kings, Prome remained a portion of the Burman kingdom till the close of the second Burmese War in 1853, when the province of Pegu was annexed to British territory.

PROME, the chief town of the district, is situated on the left bank of the Irrawaddy, 161 m. N. of Rangoon, population (1901), 27,375.

To the south and south-east the town is closed in by low pagoda-topped hills, on one of which stands the conspicuous gilded Shwe Tsan-daw. The town was taken by the British in 1825 and again in 1852, on both occasions with hardly any opposition. In 1862 it was almost entirely destroyed by fire, and was afterwards relaid out in straight and broad streets. It was erected into a municipality in 1874, and since then great improvements have been made, including waterworks. Its principal manufactures are silk cloths and lacquer ware. It is the terminus of a railway from Rangoon, which runs through the district. The other chief towns in the district are Shweidaung (pop. 10,787) and Paungde (pop. 11,105).

PROMENADE, a walk taken for exercise or more especially for social amusement, hence a road, drive or other public place laid out for the purpose, a parade. The French word promenade was first merely promenade, and came from promener, promener, to take a walk, Late Latin prominare, to drive an animal out to pasture, from pro, forward, minare, to drive on with cries and threats (minare). "Promenade concerts," so called from the fact that the audience are free to walk about or "promenade," were first introduced from Paris to London in 1838 under the name of "promenade concerts à la Musard," after the concerts given by the French musician and conductor, Philippe Musard (1753-1859). They were given at the Lyceum Theatre (English Opera House).

PROMETHEUS, son of the Titan Iapetus by the sea nymph Clymene, the chief "culture hero," and, in some accounts, the
Demigur of Greek mythical legend. As a culture-hero or inventor and teacher of the arts of life, he belongs to a wide and well-known category of imaginary beings. Thus Qat, Quah-teat, Pundjel, Mau, Ioskeha, Cagn, Wainamoinen and an endless array of others represent the ideal and heroic first teachers of Melanesians, Aths, Australians, Maoris, Algonkians, Bushmen and Finns. Among the lowest races the culture-hero commonly wears a bestial guise, is a spider (Melanesia), an eagle hawk (in some myths and south-east Australia), a coyote (north-west America), a dog or raven (Thinkeet), a mantis insect (Bushman), and so forth, yet is endowed with human or even super-human qualities, and often shades off into a permanent and practically deathless god. Prometheus, on the other hand, is purely anthropomorphic. He is the friend and benefactor of mankind. He defends them against Zeus, who, in accordance with a widely diffused mythical theory, desires to destroy the human race and supplant them by a new and better species, or who simply revenges a trick in which men get the better of him. The Polytheism and early exploits of Prometheus are given by Hesiod (Thbg. 510-616). On a certain occasion gods and men met at Mecone. The business of the assembly was to decide what portions of slain animals the gods should receive in sacrifice. On one side Prometheus arranged the best parts of the ox covered with offal, on the other the bones covered with fat, as the meat was covered in Homeric sacrifices. Zeus was invited to make his choice, chose the fat, and found only bones beneath. A similar fable of an original choice, in which the chooser is beguiled by appearances, recurs in Africa and North America (see the caskets in the Merchant of Venice). The native tribes adapt the myth to explain the different modes of life among themselves and white men. In wrath at this trick, according to Hesiod, or in other versions for the purpose of exterminating the remnants of people who escaped the deluge of Deucalion, Zeus never bestowed, or later withdrew, the gift of fire. In his philanthropic fashion," he brought fire to mankind in a hollow, fat, and in fennel stalk is still used in the Greek islands as a means of carrying a light (cf. Pliny xii. 22). According to some legends he gained the fire by holding a rod close to the sun. Probably the hollow fennel stalk in which fire was carried got its place in myth from the very fact of its common use.

We thus find Prometheus in the position of the fire-bringer, or fire-stealer, and so connected with a very wide circle of similar mythical benefactors. Among the Murr of Gipsland, to begin with, he is known by the name of the fire-bringer, or fire stealer, a bird. Tow-er-a, or fire, was in the possession of two women who hated the blacks. A man who loved men cajol'd the women, stole fire when their backs were turned, and was metamorphosed into "a bird with a long tail, which is the mark of fire." The fire-bringer in Britain is the golden or fire-crested wren. Myths like this kill two birds with one stone, and at once account for the possession of fire by men and for the marking of certain animals regarded as fire-bringers.1 In another Australian legend fire was stolen by the hawk from the bandicoot, and given to men. In yet another a man held his spear to the sun, and so got a light. A bird is fire-bringer in an Andaman island tale, and a ghost in the myth of the Maianseel. In New Zealand, Manawe stole fire from Mauiuki, the lord of fire. He used a bird's invitation. Among the Aths, in North America, fire was stolen by animals from the cuttle-fish. Among the Thlinkeets, Yehl, the raven god, brought fire to the land of the Aths. Among the Cahrocs, the coyote steals fire from "two old women." Among the Aryans of India, Soma is stolen by birds, as water is among the Thlinkeets, and mead in the Edda.4 Fire concealed himself, in the Veda, was dragged from his hiding place by Mataricivan, and was given to the priestly clan of Bhrgu.5 We also hear that Mataricivan "brought fire from afar" (R. V. i. 9, 5) and that Bhrgu found fire lurking in the water (R. V. x. 46. 2).6

In considering the whole question, one must beware of the

hasty analogical method of reasoning too common among mythologists. For example, when a bird is spoken of as the fire-bringer we need not necessarily conclude that, in each case, the bird means lightning. On the other hand, the myth often exists to explain the cause of the markings of certain actual species of birds. Again, because a hero is said to have stolen or brought fire, we need not regard that hero as the personification of fire, and explain all his myth as a fire-myth. The legend of Prometheus has too often been treated in this fashion, though he is really a culture hero, of whose exploits, such as making men of clay, fire-stealing is no more than a single example. This tendency to evolve the whole myth of Prometheus from a belief that he is personified fire, or the fire-god, has been intensified by Kuhn's ingenious and plausible etymology of the name Prométhès. The Greeks derived it from προμέθης, provident, and connected it with other such words as προμέθεια, προμέθειον. They had also the proper name Επιμέθης for the slow-witted brother of Prometheus, who combined all the savage wisdom to foolishness. Against these very natural etymologies, the philologists support a theory that Prometheus is really a Greek form of pramantha (Skt.), the fire-stick of the Hindus. The process of etymological change, as given by Steinthal, was this. The boring of the Perpendicular in the horizontal fire-stick, whereby fire was kindled, was called manthana, from math, "I shake." The preposition pra was prefixed, and you get pramantha. But Mataricivan was feigned to have brought Agni, fire, and "the fetching of the god was designated by the same verb mathnāmi as the proper earthly boring" of the fire-stick. Now this verb, especially when compounded with the preposition pra, gained the signification to tear off, snatch to oneself, rob.7 8 Steinthal goes on: "Thus the fetching of Agni became a robbery of the fire, and the pramantha (fire-stick) a robber. The gods had intended, for some reason or other, to withhold fire from men; a benefactor of mankind stole it from the notify by laus too. If such a coincidence appears incredible, we may doubt whether the belief that is common to Greeks and Cahrocs and Aths was produced, in Greek minds by an etymological confusion, in Australia, America and so forth by some

other cause. What, then, is the origin of the widely-diffused myth that fire was stolen? We offer a purely conjectural suggestion. No race is found without fire, but even some civilized races have found the artificial reproduction of fire very tedious. Thus we read (Od. v. 488-493), "As when a man hath hidden away a brand in the black embers at an upland farm, one that hath no neighbour nigh, and so saveth the seed of fire that he may not have to seek a light otherwhere, even so did Odysseus cover him with the leaves." If, in the Homeric age, men found it so hard to get the seed of fire, what must the difficulty have been in the earliest dawn of the art of fire-making? Suppose, then, that the human groups of early savages are hostile. One group lets its fire go out, the next thing to do would be to borrow a light from the neighbour, perhaps several miles off. But if the neighbours are hostile the unlucky group is cut off from fire, igni interdicitur. The only way to get fire in such a case is to steal it. Men accustomed to such a precarious condition might readily believe that the first possessors of fire, wherever they were, set a high value on it, and refused to communicate it to others. Hence the belief that fire was originally stolen. This hypothesis at least explains all myths of fire-stealing by the natural needs, passions, and characters of men, "a jealous race," whereas the philological theory explains the Greek myth by an exceptional accident of changing language, and leaves the other widely diffused myths of fire-stealing in the dark. It would occupy too much space to discuss, in the ethnological method, the rest of the legend of Prometheus. Like the Australian Pandjel, and the Maori Tiki, he made men of clay. He it was who, when Zeus had changed his wife into a fly, and swallowed her, broke open the god's head and let out his daughter Athena. He aided Zeus in the struggle with the Titans. He was punished by him on some desolate hill (usually styled Caucasus) for fire-stealing, and was finally released by Heracles.

His career may be studied in Hesiod; in the splendid Prometheus vinctus of Aeschylus, with the scholia; in Heyne's Apokoloparas; in the sculptures of Prometheus to the Aeschylean drama, and in the frequently quoted work of Kuhn. The essay of Steinthal may also be examined (Goldzieher, Myth. Hebr., Eng. trans., p. 363-392), where the amused student will discover that "Moses is a Praman-thas," with much else that is as learned and convincing as also Taylor's Early History of Man; Nesfield in Calcutta Review (January, April, 1884); and the article Fire. (A. L.)

**PROMOTER.** One who promotes (Lat. promovere, to move forward), advances or forwards any scheme, project or undertaking. The most general specific sense in which the word is now used is that of a person who takes the steps necessary to the incorporation of a joint-stock company (see COMPANY) or to the passing of a private or local act of parliament. In legal history, a promoter was one who prosecuted offenders, originally as an officer of the Crown, later as a common informer; the term is still used thus of the prosecutor in a suit in an ecclesiastical court.

**PONGBUCK.** Proncorn, or (in America) simply Antelope, the sole existing representative of a family (Antilocapridae) of hollow-horned ruminants which the horn-sheaths are forked and annually shed and renewed. Standing about 3 ft. high at the shoulder and slightly more at the croup, the male prongbuck has the black horns rising vertically upwards immediately above the eyes. The general colour is bright sandy fawn, with much white on the face, three white bars on the throat and white under parts and buttocks. The white throat-bands are evidently protective; and the long white hair on the buttocks can be erected and expanded into large chrysanthemum-like bunches as in Japanese deer; these being guides to the members of the herd when in flight. The tail is short; lateral hoofs are wanting; and the teeth are tall-crowned. Female prongbuck produce one or two young at a birth, and are either hornless or furnished with small and more or less rudimentary horns.

Pronbuck, of which two races, the typical Antilocapra americana and A. mexicana, are recognized by American naturalists, inhabit the open plains of the temperate districts of western North America, where they were formerly very abundant. Nowadays their numbers have become greatly diminished and small and isolated bands represent the great herds of former years. Young prongbuck are very liable to be attacked by wolves; to protect them from these marauders the females first clear an area in the middle of a patch of cactus, by jumping on the plants with their sharp hoofs, and bring forth their offspring in the protected space. Certain extinct American ruminants, namely Cosoryx, Blastomeryx and Meryxus are believed to be in some way related to the prongbuck; but they have frontal appendages more like antlers than horns. In view of this presumed relationship it seems preferable to retain the family Antilocapridae rather than relegated it to the rank of a sub-family of Bovidae. (See PECORA.)

**PRONUNCIATION.** (Lat. pronuntiatio, from pronuntiare, proclaim, announce, pronounce), the action of pronouncing, the manner of uttering an articulate vocal sound (see PHONETICS and VOICE). The original sense of the Latin, a public declaration, is preserved in Spanish pronunciamento, a manifesto or proclamation, especially as issued by a party of insurrection or revolution.

**PRONY, GASPARD CLAIR FRANÇOIS MARIE RICHE DE** (1755-1839), French engineer, was born at Chamelet, in the department of the Rhone, on the 22nd of July 1755, and was educated at the École des Ponts et Chaussées. His Mémoire sur la poussée des voitures published in 1783, in defence of the principles of bridge construction introduced by his master J. R. Perronnet, attracted special attention. The laborious enterprise of drawing up the famous Tables du Cadastre was entrusted to his direction in 1792, and in 1794 he was appointed professor of the mathematical sciences at the École Polytechnique, becoming director at the École des Ponts et Chaussées four years later. He was employed by Napoleon to superintend the engineering operations for protecting the province of Ferrara against the inundations of the Po and for draining and improving the Pontine Marshes. After the Restoration he was likewise engaged in regulating the course of the Rhone, and in several other important works. He was made a baron in 1828, and a peer in 1835. He died at Asnières (Seine) on the 20th of July 1839. For the "Prony Brake" see DYNAMOMETER.

**PROOF** (in M. Eng. prove, prove, prove, prove, &c., from O. Fr. prouver, proue, &c., mod. preuve, Late. Lat. proba, probare, to prove, to test the goodness of anything, probus, good), a word of which the two main branches are derived from those of "to prove," viz. to show to be true, to test, to try. Of the first division the chief meanings are: that which establishes the truth of a fact or the belief in the truth, demonstration, for the nature of which see LOGIC. In law "proof" is the general term for the establishment of the material facts in issue in a particular case by proper legal means to the satisfaction of the court (see EVIDENCE); specifically, documents so attested as to form legal evidence, written copies of what a witness is prepared to support on oath, and the evidence of any case in the court records are all termed "proofs." In Scots law the term is used of a trial before a judge alone as opposed to trial by jury. From the general sense of examination, trial or assay derived from "to prove," to test the quality of anything, "proof" is used of that which has succeeded in standing a trial or test; the commonest form in which this use appears is as a compound adjective, thus materials are said to be "waterproof," "armour," "bullet-proof," and the like. The principal other uses are for a standard of strength for spirit (see ALCOHOL and SPIRITS) for a trial impression, in printing, in which corrections and additions can be made (see article PROOF-READING) and, in engraving and etching, for one of a limited number of impressions made before the ordinary issue is printed. In the earlier history of engraving a "proof" was an impression during the process of printing made for the artist's inspection, approval or correction, whence its name. In the modern use of the term, where the impression has been taken before the inscription has been added to the plate, it is called a "proof before letter."

In bookbinding, some of the shorter or narrower leaves are left with rough edges, "uncropped," to show that the book has not been "cut," these are styled "proofs."
PROOF-READING, the art or business of correcting for the press the printed "proofs" of articles or books set in type before publication. The special business of a proof-reader, attached to a printing house, is to correct these proofs before they are shown to the author; he is an intermediary between the compositor and the author, and as such his functions may vary according to his capacities. Proof-reading as a distinct department in the work of a printing office does not date from the very earliest days of "the art preservative of all arts." The first products of the printing-press show abundant evidences of the non-existence of any one specially charged with the duty of correcting the compositors' mistakes. How much conjectural emendation and consequent controversy would have been avoided if the First Folio Shakespeare had been more typographically correct! Sir Theodore Martin said that the typographical errors alone of that work had been computed to number nearly 20,000, which amounts to 2 2/5% of the total number of words in the volume. It was a usual practice in the 17th and 18th centuries for authors to send the proofs of their works to their personal friends for correction; and in the universities and colleges, sheets of works passing through the press were frequently hung up in the quadrangles for public inspection and correction. With the growth of printing gradually came a demand for systematic proof-reading, and the leading printers engaged scholars and men of letters to read proofs for them. Among these may be mentioned Cruzen, of Concordance fame ("Alexander the Corrector"), and William Julius Mickle, poet, and translator of Luiz de Camoens's Lusias, who was a reader at the Clarendon Press. Goldsmith and Dr Johnson also are credited with having wielded the proof-reader's pen. Times, however, have changed since, as the elder D'Israeli wrote, "it became the glory of the learned to be correctors of the press to eminent printers," and to-day in every printing office the proof-reader is found—an unobtrusive functionary, known to publishers, authors, editors and journalists, but for the most part unknown to the general reading public; a functionary who yet does useful, often valuable, and always indispensable work. The influence of good proof-reading upon the character of book, newspaper and general printing is too often underrated. The celebrated old printing offices and the foremost of the modern ones owe their reputation for good workmanship largely to the excellence and thoroughness of the work done in their reading-rooms, for no perfection of paper, ink, machining or binding can atone for bad or slipshod typography.

The nature of the proof-reader's work, frequently monotonous and uninteresting, will be made clear by what follows. After the compositor (see Typography) has set up, by hand or type-setting machine, the "copy" supplied to him, a slip or page proof is pulled and sent with the manuscript to the proof-reader. The manuscript is then read aloud by a copy-holder, while the proof-reader carefully follows the text before him letter by letter, marking on the margin of the proof all the more obvious blunders—spelling errors, turned letters, words differing in size from those in the immediate context—and other errors, and seeing that the punctuation clearly defines the author's meaning. The copy-holder reads rapidly—indeed, an ordinary listener would imagine it to be impossible for the proof-reader to understand him—and as the reader is obliged to keep pace, he goes through the proof again, without the aid of the copy-holder, in order to mark any errors that may have escaped him in the first rapid reading. The proof, called the "first proof," is then sent to the compositor to be corrected. When this has been done, a further proof is submitted to the reader, who, upon satisfying himself by careful revision that it is free from typographical mistakes, passes it as "clean." If the reader, when dealing with the first proof, notices any slips in grammar or errors of fact on the part of the writer, or is in doubt whether any particular word in the manuscript has been correctly deciphered, he underlines the word or passage, and places "Qy." (query) in the margin. The proof is then dispatched to the author or editor. On the return of the proof, after the writer's corrections and alterations have been carried out, the type is made up into pages and sheets and another proof pulled. This passes into the hands of the press reader (as distinguished from the "first proof-reader"), who checks the headlines, page numbers, and sequence of chapters or sections, and observes that the pages are of uniform length and that a sufficient amount of margin is allowed, before finally reading through the text. When the press-reader's corrections have been effected, the work is ready for the printing machine or the stereotyping foundry.

The cost of proof-reading may be said to range from about 7 1/2 to 20% of the cost of composition, varying, of course, with the nature of the work.

Many prominent authors have expressed in warm terms their gratitude to the proof-reader for valuable assistance rendered by apt queries and pertinent suggestions. Two of these expressions, one from a poet, the other from a novelist, may with propriety be given as typical, one from a novel, Mickle's "Julius Mickle," and the other from a poet, Charles Dickens: "I know from some slight practical experience what the duties of correctors of the press are, and how these duties are usually discharged. And I can testify, and do testify here, that they are not mechanical—that they are not mere matters of manipulation and routine; but that they require from those who perform them much natural intelligence, much super-added cultivation, considerable readiness of reference, quickness of perception, and an excellent understanding. And I must gratefully acknowledge that I have never gone through the sheets of any book I have written without having had presented to me by the corrector of the press something I had overlooked—some correction which had made the work, as much as its author, the better for the extra labor. In this declaration I have not the slightest doubt that the great body of my brother and sister writers, and men of literature, heartily concur." Robert Browning thus corroborated Dickens: "I have had every opportunity of becoming acquainted with, and gratefully acknowledging, the extreme service rendered to me; and, if there be no exceptional case, the qualifications of the "proof-readers and correctors are important indeed." P. Larousse spoke of French proof-readers as his "collaborateurs les plus chers," and Hugo referred to them as those "modestes savants" so well able "to be of service in the press and to the Académie Française," consulted them on points arising in the revision of the Academy's dictionary.

Though much good work is done by readers who have not been practical printers, yet the technical knowledge gained by working as a compositor is essential to the best proof-reading. The reader must possess a quick eye, alert to note every error or mechanical imperfection in the type, and must scrutinize closely every letter of every word, clause and sentence, while keeping a grasp of the sense of the matter he is dealing with. The more varied his information and the wider his knowledge, the better. Though his strict duty is merely to see that the author's copy is properly reproduced, he is always glad to give the author the benefit of the experience and knowledge he has acquired, and, as a consequence, he is constantly crossing the line which separates proof-readers and editorial duties. From this last consideration has arisen the plea for the reader, on the daily press especially, being placed under the control of, and made responsible to, the editorial department rather than the head of the composing-room.

Proof-readers in Great Britain have a trade union, and many of them retain membership of the unions to which they belonged when working as compositors; and in some states of the American Union as well as in Scotland and Ireland they are recognized as members of their society. The oldest English organization devoted entirely to the interests of proof-readers is the Association of Correctors of the Press, founded in 1854. The chief aim of the association is to establish a system of membership as to vacant situations, so as to keep them in full employment; but it also assists members in distress from its benevolent fund, and provides pensions, as well as a sum of money at death. There is in France the Société des correcteurs des imprimérises de Paris. There are also proof-readers' associations in several countries, as Austria and Germany. Women, for in the United States women bulk largely in the rank of proof-readers. There are very few women proof-readers in London. In Edinburgh, however, women form a considerable proportion of the proof-reading staff.

PROPOSITION, the multiplication of a species by natural processes of reproduction (q.v.). The Latin propagare meant to fasten down (pro- and pangere, to fasten) layers, shoots or
slips (propagines) of plants for the purpose of reproduction, hence to generate, reproduce and generally to extend or increase.

It is in this sense that "propagation" is used of the spreading or dissemination of doctrines, ideas, opinions, &c. The term "propaganda," often wrongly used as a plural word, means properly an organization or association for the spreading of particular beliefs or opinions, and is an adaptation of the name of that committee of cardinals in the Roman curia which supervises foreign missions, the full title being Congregatio de propaganda fide.

PROPELLANTS, a generic name for explosives used for propelling projectiles from guns and other firearms, in order to distinguish them from the more violent explosives used in shells, mines, &c., to produce a blasting effect. Some explosive substances can be used both as propellants and as bursters, as for example gunpowder, and some of the ingredients of a propellant may be similar, though differently proportioned and combined, to those of a "high explosive." (For details see EXPLOSIVES, GUNPOWDER, CORDITE, &c.)

PROPERTIUS, Sextus (fl. 30-15 B.C.), the greatest of the elegiac poets of Rome, was born of a well-to-do Umbrian family at or near Assisium (Asillis), the birthplace also of the famous St. Francis. We learn from Ovid that Propertius was his senior, but also his friend and companion; and that he was third in the sequence of elegiac poets, following Gallus, who was born in 69 B.C., and Tibullus, and immediately preceding Ovid himself, who was born in 43 B.C. We shall not then be far wrong in supposing that he was born about 50 B.C. His early life was full of misfortune. He lost his father prematurely; and after the battle of Philippi and the return of Octavian to Rome, Propertius, like Virgil and Horace, was deprived of his estate to provide land for the veterans, but, unlike them, he had no patrons at court, and he was reduced from opulence to comparative indigence. The. despairs of his friends provoked the insurrection generally known as the bellum perusinum from its only important incident, the fierce and fatal resistance of Perugia, which deprived the poet of another of his relations, who was killed by brigands while making his escape from the lines of Octavian. The loss of his patrimony, however, thanks no doubt to his mother's providence, did not prevent Propertius from receiving a superior education. After, or it may be, during its completion he and she left Umbria for Rome; and there, about the year 34 B.C., he assumed the garb of manly freedom. He was urged to take up a pleader's profession; but, like Ovid, he found in letters and gallantry a more congenial pursuit. Soon afterwards he made the acquaintance of Lycina, about whom we know little beyond the fact that she subsequently excited the jealousy of Cynthia, and was subjected to all her powers of persecution (sexandi). This passing fancy was succeeded by a serious attachment, the object of which was the famous "Cynthia." Her real name was Hostia, and she was a native of Tibur. She was a courtisan of the superior class, somewhat older than Propertius, but, as it seems, a woman of singular beauty and varied accomplishments. Her own predilections led her to literature; and in her society Propertius found the intellectual sympathy and encouragement which were essential for the development of his powers. Her character, as depicted in the poems, is not an attractive one; but she seems to have entertained a genuine affection for her lover. The intimacy began in 28 and lasted till 23 B.C. These six years must not, however, be supposed to have been a period of unbroken felicity. Apart from minor disagreements an infidelity on Propertius's part excited the deepest resentment in Cynthia; and he was banished for a year. The quarrel was made up about the beginning of 23 B.C.; and soon after Propertius published his four books of elegiac poems and inscribed it with the name of his mistress. Its publication pleased the poetical part of his contemporaries, and amongst other things procured him admission to the literary circle of Maecenas. The intimacy was renewed; but the old enchantment was lost. Neither Cynthia nor Propertius was faithful to the other. The mutual ardour gradually cooled; motives of prudence and decorum urged the discontinuance of the connexion; and disillusion changed insensibly to disgust. Although this separation might have been expected to be final, it is not certain that it was so. It is true that Cynthia, whose health appears to have been weak, does not seem to have survived the separation long. But a careful study of the seventh poem of the last book, in which Propertius gives an account of a dream of her which he had after her death, leads us to the belief that they were once more reconciled, and that in her last illness Cynthia left to her former lover the duty of carrying out her wishes with regard to the disposal of her effects and the arrangements of her funeral. Almost nothing is known of the subsequent history of the poet. He was alive in 16 B.C., as some allusions in the last book testify. And two passages in the letters of the younger Pliny mention a descendant of the poet, one, Passeannus Paullus. Now in 18 B.C. Augustus carried the Leges Iuliae, which offered inducements to marriage and imposed disabilities upon the celibate. Propertius then may have been one of the first to comply with the new enactments. He would thus have married and had at least one child, from whom the contemporary of Pliny was descended. Propertius had a large number of friends and acquaintances, chiefly literary, belonging to the circle of Maecenas. Amongst these may be mentioned Virgil, the epic poet Pontius, Bassus (probably the iambic poet of the name), and at a later period Ovid. We hear nothing of Tibullus, nor of Horace, who also never mentions Propertius. This reciprocal silence is probably significant. In person Propertius was pale and thin, as was to be expected in one of a delicate and even sickly constitution. He was very careful about his personal appearance, and paid an almost foppish attention to dress and gait. He was of a somewhat voluptuous and self-indulgent temperament, which shrank from danger and active exertion. He was awkwardly sensitive about the opinion of others, eager for their sympathy and regard, and, above all, anxious to be admired. His over-emotional nature passed rapidly from one phase of feeling to another; but the more melancholy moods predominated. A vein of sadness runs through his poems, sometimes breaking out into querulous exclamation, but more frequently venting itself in gloomy reflections and prognostications. He had fits of superstition which in healthier moments he despised.

The poems of Propertius, as they have come down to us, consist of four books containing 4046 lines of elegiac verse. The first book, or Cynthia, was published separately and early in the poet's literary life. It may be assigned to 25 B.C. The dates of the publication of the rest are uncertain, but none of them was published before 24 B.C., and the last not before 16 B.C. The unusual length of the second one (1402 lines) has led Lachmann and other critics to suppose that it originally consisted of two books, and they have placed the beginning of the third book at ii. 10, a poem addressed to Augustus, thus making five books, and this arrangement has been accepted by several editors.

The subjects of the poems are threefold: (1) amatory and personal, mostly regarding Cynthia—seventy-two (sixty Cynthia elegies), of which the last book contains three; (2) political and social, on events of the day—thirteen, including three in the last book; (3) historical and antiquarian—six, of which five are in the last book.

The writings of Propertius are noted for their difficulty and their disorder. The workmanship is unequal, curtness alternating with redundance, and carelessness with elaboration. A desultory sequence of ideas, an excessive vagueness and indirection of expression, a peculiar and abnormal latinity, a constant tendency to exaggeration, and an immediate indulgence in learned and literary allusions—all these are obstacles lying in the way of a study of Propertius. But those who have troubled to find out how the poet thought and wrote are well repaid. For power and range of imagination, for freshness and vividness of conception, for truth and originality of presentation, few Roman poets can compare with him when he is at his best. And this is when he is carried out of himself, when the discordant qualities of his genius are, so to say, fused together.
by the electric spark of an immediate inspiration. His vanity and egotism are undeniable, but they are redeemed by his fancy and his humour.

Two of his merits seem to have impressed the ancients themselves. The first is most obvious in the scenes of quiet description and emotion in whose presentation he particularly excels. Softness of outline, warmth of colouring, a fine and almost voluptuous feeling for beauty of every kind, and a pleading and melancholy tenderness—such were the elements of the spell which he threw round the sympathies of his reader, and which his compatriots expressed by the vague but expressive word blanditia. His poetic facundia, or command of striking and appropriate language, is more noticeable still. Not only is his vocabulary very extensive, but his employment of it extraordinarily bold and unconventional. New settings of use, idiom and syntactic construction do not surprise us, and, in spite of occasional harshness, secure for his style an unusual freshness and freedom. His handling of the elegiac couplet, and especially of its second line, deserves especial recognition. It is vigorous, varied and even picturesque. In the matter of the rhythms, casuarias and elisions which it allows, the metrical treatment is much more severe than that of Catullus, whose elegias are comparatively rude and barbarous; but it is not bound hand and foot, like the Ovidian distich, in a formal and conventional system. An elaborate symmetry is observable in the construction of many of his elegies, and this has tempted critics to divide a number of them into strophes.

Propertius's poems bear evident marks of the study of his predecessors, both Greek and Latin, and of the influence of his contemporaries. He tells us himself that Callimachus and Philocles were his masters (iii. i, seq.), and that it was his ambition to be the Roman Catullicus (iv. l, 64). But, as he also said, his debt to these writers is chiefly a formal one. Even into his mythological learning he breathes a life to which these dry scholars are strangers. We can trace obligations to Meleager, Theocritus, Apollonius Rhodius and other Alexandrines, and amongst earlier writers to Homer, Pindar, Aeschylus and others. Propertius's influence upon his successors was considerable. There is hardly a page of Ovid which does not show obligations to his poems, while other writers make a more sparing use of his stories.

A just appreciation of the genius and the writings of Propertius is made sensibly more difficult by the condition in which his works have come down to us. Some poems have been lost; others are fragmentary; and many are more or less disfigured by corruption and disarrangement. The manuscripts on which we are partly or wholly relied are both late and deeply interpolated. Thus the restoration and interpretation of the poems is one of peculiar delicacy and difficulty.

On the Propertii see Mommsen in Hermes, iv. 370; Haupt, Opusc. i. 282. Inscriptions of Propertius have been found at Assisi. Propertius's family was not " noble," ii. 34, 55, 6, and ii. 24, 37 seq. Apart from the question of reading in iv. 1, 125 (MSS. Assis.), " the climbing walls of his town " (scandentes arcus, scannus murus, iv. 1, 65 and loc. cit.), its nearness to Perugia, and its position close above the plain (i. 22, 9, 10) are decisive for Assisi as the birthplace of Ovid. Ovid thus assigns Propertius his place: successor fuit " (B. 54. 1), cuius nomine Gallus: " Propertius (Thullius)."

For Ovid's friendship with Propertius see below—iv. i, 121 seq. is the chief authority for the earlier events of his life, 127 seq.: " Ossaque legisti non illa acta legenda Patris et in tenebris cogitabat: Tise Larce, Nam tibi cum multa versentur rura invenit Abatubis excutas perturba tristes opes."

Elsewhere he says that he is " non ita dives " (ii. 24, loc. cit.) and that he had " nulla domi fortuna recta, ii. 54, loc. cit. His life of exile, however, is not altogether the work of his " death of his kinsman, generally supposed to be the Gallus of i. 21, see i. 22, 5—8. Propertius's mother is mentioned more than once, in very affective tenions in i., ii. 21. She was dead when i. 13 (11) was written, and we may infer that the death of a kinsman did not affect the quality of Propertius's education, the poems themselves are the only, but a sufficient, testimony. For Lycurgus see iii. 15, 3—10. 43- Cynthia (Hostis) was a native of Thiruv (iv. 7, 85), and probably a girl of frequent residence there. It is probable that the death of his kinsman, generally supposed to be the Gallus of i. 21, see i. 22, 5—8. Propertius's mother is mentioned more than once, in very affective tenions in i., ii. 21. She was dead when i. 13 (11) was written, and we may infer that the death of a kinsman did not affect the quality of Propertius's education, the poems themselves are the only, but a sufficient, testimony. For Lycurgus see iii. 15, 3—10. 43—

The house in the Subura, the scenes of occurrence like those in i. 3, ii. 29, the fact that Propertius could not marry her, &c. For references to her beauty see ii. 5 sqq. and 3. 9 sqq.; i. 13, 23, 24; to her poetry, iii. 2, 21; to other accomplishments, i. 27, 27 sqq.; iii. 20, 7 sqq. She was the first to mention the name of Propertius, i. 13 (14), i. 19 sqq., the Etruscan deity of her name, and iv. 21; the goddess to the consulship of F. Scipio in the same year. For Passenius Paullus (or as an Assisi inscription calls him C. Passenius Sergius Paulus Propertius Blaces), see Pliny (Ep. vi. 15), " municeps Properti acu et regionis, qui sunt cum paucis leges avelli causa Iulias amantem fuerunt accipuit, Propertium in primis a quo genus duci, vera suboles eoque simillima illi in quo ille praecipius, sile eos eius in manue suspepsis, leges opus tremul malle icundum et plane in Propertio donum scriptum: i. 2, 13."

The second edition of Logan's " Specimens of Latin" was published for the benefit of young ladies. The second edition of Logan's " Specimens of Latin" was published for the benefit of young ladies. For the general character of the poem see B. 54, 2, 41 sqq.

PROPHET

In Roman law and in modern systems of law based on it, property is divided into "movables" and "immoveables"; in English law, on the other hand, the division is into personal property, including chattels real, and real property (see Personal Property and Real Property). Theatrical usage has given a specific meaning to the word, that of any article used on the stage during the performance of a play.

PROPHET (προφήτης), a word taken from the vocabulary of ancient Greek religion, which passed into the language of Christianity, and so into the modern tongues of Europe, because it was adopted by the Hellenistic Jews as the rendering of the Hebrew נביא (nabî ' pl., nebhîm). The word therefore as we use it is meant to convey an idea which belongs to Hebrew and not to Hellenic belief.

That the word nabî, "prophet," originally signified one who speaks or announces the divine will, is rendered highly probable by a comparison of the Assyrian nabû, meaning (a) "call by name," and (b) "name," (see Deut. 34:16, Habel-wörterbuch s. v. nabâs). The Babylonian deity Nabâ (in Old Testament Nebo) is a contraction from Na-bi-u, which thus corresponds closely with the Hebrew nabî and originally signified the speaker or proclaimer of destiny. He was represented as the writer of the tablets of destiny, and was therefore regarded as the interpreter of oracles (see Zimmer, K. A. T. pp. 400, 404). Accordingly this derivation is preferable to that suggested by earlier Semitists from Gesenius to (in recent times) Kautzsch ("Religion of Israel," Hastings's Dict. Bible, extra vol., p. 652 footnote), and Cheyne (Ency. Bibl. col. 3853), which connects it with another verbal root naba, "bubble" or "gush." This Davidson ("Prophecy and Prophets," Hastings's Dict. Bible, p. 108 footnote) rightly rejects. While he connects it with the Arabic root nabâ', "come into prominence" (con. H. "announcement," he makes ascribable to the ultimate Semitic origin. Zimmer (K. A. T. p. 390) gives the name of a priest-official munâmbû (lit. "howler"), which is derived from a Fiel of nabâ, viz. nubbâ (= munnâm), "bawl" or "howl." A brief sketch will be given (1) of the history of Hebrew prophecy (in supplement to what has been already said in the article Hebrew Religion or is to be found in the articles devoted to individual prophets), and (2) of prophecy in the early Christian Church.

1. The Prophets of the Old Testament.—The author of 1 Sam. ix. 9 tells us that "beforetime in Israel, when a man went to inquire of God, thus he spake, Come and let us go to the seer; for he is that now called a prophet (nabîp) was beforetime called a seer." This remark is probably a later gloss. Samuel was a "seer" (ver. 11), or, as he is also called (ver. 6 seq.), a "man of God," that is one who stood in close relation to God as an ordinary man; "all that he said was sure to come to pass," so that he could be consulted with advantage even in private matters like the loss of the asses of Kish. The narrative of 1 Sam. ix. belongs, as Budde has demonstrated, to the older stratum of the narrative (called J) which includes ix., x. 1-16, xi. 1-11, 15, xiii., xiv. 1-16 in which Samuel is a priest-seer of a provincial town, without the high functions of government as Shâphet. We must not suppose that the word "prophet" had merely become more common in his time and supplanted an older synonym. This is clearly shown a few verses farther down, where we see that there were already in Samuel's time people known as nebhîm, but that they were not seers. The seer (rôhâ) appears individually, and his function was probably not so much one of speech as of the routine of close observation of the entreaties of slaughtered victims, like the Assyrian barâ (see Priest). It is in this way that the function of the seer is closely connected (as in the case of Balaam) with sacrifices. With the prophets it is quite otherwise; they appear not individually but in bands; their prophesying is a united exercise accompanied by music, and seemingly dance-music; it is marked by strong excitement, which sometimes acts contagiously, and may be so powerful that he who is seized by it is unable to stand, and, though this condition is regarded as produced by a divine afflatus, it is matter of ironical comment when a prominent man like Saul is found to be thus affected. Samuel in his later days appears presiding over the exercises of a group of nebhîm at Ramah, where they seem to have had a sort of coenobium (Naioth), but he was not himself a nabî—that name is never applied to him except in 1 Sam. iii. 21, where it is plainly used in the later sense for the idea which in Samuel's own time was expressed by "seer."

But again this special type of nebhîm seems to have been a new thing in Israel in the days of Samuel. Seers there had been of old as in other primitive nations; of the two Hebrew words literally corresponding to our seer, rôhâ and hîshéh, the second is found also in Arabic, and seems to belong to the primitive Semitic vocabulary. But the enthusiastic bands of prophets are nowhere mentioned before the time of Samuel; and in the whole previous history the word prophet occurs very rarely, never in the very oldest narratives, and always in that sense which we know to be later than the age of Samuel, so that the use of the term is due to writers of the age of the kings, who spoke of ancient things in the language of their own day. The appearance of the nebhîm in the time of Samuel was, it would seem, as is explained in the article Hebrew Religion, one manifestation of the deep pulse of suppressed indignant patriotism which began to beat in the hearts of the nation in the age of Philistine oppression, and this fact explains the influence of the movement on Saul and the interest taken in it by Samuel.

It was perhaps only in time of war, when Israel felt himself to be fighting the battles of Yahweh, that the Hebrew was stirred to the depths of his nature by emotions of a religious colour. Thus the deeper feelings of religion were embodied in the warlike patriotism, and these feelings the Philistine oppression had raised to extreme tension among all who loved liberty, while yet the want of a captain to lead forth the armies of Yahweh against his foesen deprived them of their natural outlet.

In its external features the new phenomenon was exceedingly like what is still seen in the East in every sîk of dervishes—the enthusiasm of the prophets expressed itself in no artificial form, but in a way natural to the Oriental temperament. Proceedings with pipe and hand-drums, such as that described in 1 Sam. x., were indeed a customary part of ordinary religious feasts; but there they were an outlet for natural merriment, here they have changed their character to express an emotion more sombre and more intense, by which the prophets, and (1 Sam. viii. 17) the people, were moved. They were successful when they had power to influence, but they occupied but a subordinate place in the whole scheme of revelation, even in the Apocalyptic literature. But in any case the Greek language hardly offered another word for an organ of revelation so colourless as προφήτης, while the condition of etymology among the ancients made it possible to interpret προφήτης as having a special reference to prediction (so Eusebius, Dem. Ev. v., deriving it from προφανεία).
PROPHET

seemed to lose their old personality and to be swayed by a supernatural influence. More than this hardly lies in the expression "a divine spirit" (מַדְּבָּר ה' מִלֵּי), which is used not only of the prophetic afflatus but of the evil frenzy that afflicted Saul's later days. The Hebrews had a less narrow conception of the spiritual than we are apt to read into their records.

To give a name to this new phenomenon the Israelites, it would seem, had to borrow a word from their Canaanite neighbours. At all events the word נבְּהָלִים is neither part of the old Semitic vocabulary (in Arabic it is a late loan word) nor has it any etymology in Hebrew, the cognate names "prophesy" and the like being derived from the noun in its technical sense. But we know that there were נבְּהָלִים among the Canaanites; the "prophets" of Baal appear in the history of Elijah as men who sought to attract their god by wild orgiastic rites. In fact the presence of an orgiastic character is as marked a feature in Canaanite religion as the absence of it is in the oldest religion of Israel; but the new Hebrew enthusiasts had at least an external resemblance to the devotees of the Canaanite sanctuaries and this would be enough to determine the choice of a name which in the first instance seems hardly to have been a name of honour. In admitting that the name was borrowed, we are not by any means shut up to suppose that the Hebrew נבְּהָלִים simply copied their Canaanitic neighbours. The phenomenon is perfectly intelligible without any such hypothesis. A wave of intense religious feeling passed over the land and finds its expression, according to the ordinary law of oriental life, in the formation of a sort of enthusiastic religious order. The Nazarites and the Rechabites are parallel phenomena, though of vastly inferior historical importance.

It may be assumed that the name נבְּהָלִים, while it originated from Babylonian sources, reached Israel through Canaanite channels (cf. Kautzsch, Religion of Israel,1 in Hastings's Dict. Bible extra vol., p. 653). Some support is given to this view by (a) the statement in 1 Kings viii. 10 that three hundred prophets of Baal and Asherah sat at Jezreel's table; (b) the fact that Deborah, Samuel, Elijah, Elisha, Micaiah ben Imlah, the most notable of the earlier representatives of prophecy, belonged to northern Israel, which was more subject to Canaanite-Pheenician influence.

It is certainly probable that the נבְּהָלִים emerged by a process of continued development, of which the intermediate stages are lost, from the older רוכֵח, as the explanatory gloss in 1 Sam. ix. 9 evidently intimates. Samuel himself is called a רוכֵח. We may assume that like the practice of the soothsaying priest (the earlier type of priest) and of the קֹשֶם (diviner), so the procedure of the רוכֵח was mechanical and magical in character. Clear indications of a primitive magical modus operandi appear as survivals in the narratives of the pre-exilic prophets. The wonder-working staff of Elisha (2 Kings iv. 20, 31) is one of these indications. There are likewise traces of survival in the example of a sympathetic magic transformed into the acted парабол of the rדח prophets.1 To the נבְּהָלִים series of incantations or of the špru series edited by Zimmern (in his Beiträge zur Kenntnis der Babylonischen Religion) will recollect the images over which the priest sorcerer recites his formulae. The accompanying actions (tying knots, &c.) which he performs are assumed to work themselves out on the enemy whose evil eye or sorcery is blunting the happiness of the suppliant (see Hastings's Dict. Bible, "Magic," p. 290, where examples are cited). The signs or symbolic acts of the prophet probably originated in the actions of sympathetic magic. Thus in the vivid scene of 1 Kings xii. 11 the iron horns of Zedekiah ben Kenah'nah, and in 2 Kings xiii. 15-19 the magic of the arrow shot eastward and of the thrice stricken floor, are evident survivals of an older practice. The

1 If this account of the origin of the נבְּהָלִים is correct (cf. Kuenen, Prophets, Eng. trans., p. 554 seq.), the etymological sense of the word נבְּהָלִים is comparatively unimportant. The root seems to mean "to start up," "to rise into prominence," and so "to become audible." This is based on the Arabic naba'a; see the remarks at the beginning of this article.

magical act passes into sign or symbol, not however without the accompanying conception that underlies it still persisting that a mysterious effectuating potency belongs to the symbolic act. The mystic power of a significant name Mahēr škalāl ḫask ḫaz inscribed on a tablet and bestowed on a child (Isa. viii. 1-4, cf. xx. 2 sqq.), of the "thongs and bars" of Jer. xxvii. (in which contending prophets confront one another in a contest of symbols), of the linen girdle of ch. xiii. 1 sqq., and of the potter's vessel of xix. 1 sqq., are further illustrations of survivals from the old world of magic. The symbol gradually passes into mere metaphor, and we already begin to see this when we compare Ezekiel's oracles and those of the Deutero-Isaiah with the records of the words and deeds of earlier prophets.

The peculiar methods of the prophetic exercises described in 1 Sam. were of little consequence for the future development of prophecy. The heat of a first enthusiasm necessarily cooled when the political conditions that produced it passed away; and, if the prophetical associations had done no more than organize a new form of spiritual excitement, they would have only added one to the many mechanical types of hysterical religion which are found all over the East. Their real importance was that they embodied an intenser vein of feeling than was expressed in the ordinary feasts and sacrifices, and that the greater intensity was not artificial, but due to a revival of national sentiment. The worship of the local sanctuaries did nothing to promote the sense of the religious unity of Israel; Yahweh in the age of the Judges ran no small risk of being divided into a number of local Baals, givers of natural good things each to his own locality. The struggle for freedom called forth a deeper sense of the unity of the people of the one Yahweh, and in so doing raised religion to a loftier plane; for a faith which unites a nation is necessarily a higher moral force than one which only unites a township or a clan. The local worship, which subsisted unchanged during the greater part of the Hebrew kingship, gave no expression to this rise in the religious consciousness of the nation; on the contrary, we see from the prophetic books of the 8th century that they lagged more and more behind the progress of religious thought. But the prophetic societies were in their origin one symptom of that upheaval of national life of which the institution of the human sovereign reigning under the divine King was the chief fruit; they preserved the traditions of that great movement; they were, in however imperfect a way, an organ of national religious feeling, and could move forward with the movement of national life. And so, though we cannot follow the steps of the process, we are not surprised to learn that they soon had an established footing in Israel, and that the prophets came to be recognized as a standing sacred element in society. What was their precise place in Hebrew life we hardly know but they formed at least a religious class which in all its traditions represented the new national and not the old communal and particularistic life. One characteristic point which appears very early is that they felt themselves called upon to vindicate the laws of divine righteousness in national matters, and to check by the conduct of the kings, who were answerable to human authority. The cases of Nathan and David in the matter of Uriah, of Elijah and Ahab after the judicial murder of Naboth, will occur to everyone, and from the Hebrew standpoint the action of Gad in the matter of the census taken by David belongs to the same category. Such interventions with an Eastern king demanded great moral courage, for, though to some extent protected by their sacred character, the persons of the prophets were by no means legally inviolable (1 Kings xix. 2, xxii. 27; 2 Kings vi. 31). It is far from easy to determine how far the development of the class of prophets meant the absorption into it of the old seers. Probably both coexisted for some time. At all events we know from Isa. iii. 2, 3, that in Isaiah's time the קֹשֶם still held an important place in society as well as the prophet and the magician. The functions of רוכֵח and נבְּהָלִים may indeed at first have been mingled. The great prophecy of Nathan (2 Sam. vii.) is of too disputed a date to be cited in
evidence, but already in David’s time we find that Gad the nébbî¹
is also the king’s seer (2 Sam. xxiv. 11; cf. 1 Sam. xxii. 5), and
by-and-by it comes to be clearly understood that the prophets
are the appointed organs of Yahweh’s communications with His
people or His king. The rise of this function of the prophets is
plainly parallel with the change which took place under the kings
in the position of the priestly oracle; the Torah of the
priests now dealt rather with permanent sacred ordinances
than with the giving of new divine counsel for special
occasions. Yahweh’s ever-present kingship in Israel, which
was the chief religious idea brought into prominence by the
national revival, demanded a more continuous manifestation
of His revealing spirit than was given either by the priestly lot
or by the rise of occasional seers; and where could this
be sought except among the prophets? It does not, of course,
follow that everyone who had shared in the divine affluence of
prophetic enthusiasm gave forth oracles; but the prophets
as a class stood nearer to other men to the mysterious workings
of Yahweh, and it was in their circle that revelation seemed
to have its natural home. A most instructive passage in this
respect is 1 Kings xxii., where we find some four hundred pro-
phets gathered together round the king, and where it is clear
that Jehoshaphat was equally convinced, on the one hand, that
the word of Yahweh could be found among the prophets, and on the
other that it was very probable that some, or even the mass of
them, might be no better than liars. And here it is to be observed
that Micaiah, who proved the true prophet, does not accuse
the others of conscious imposture; he admits that they speak
under the influence of a spirit proceeding from Yahweh, but it is
a lying spirit sent to deceive. The sublime and solitary
figure of Elijah, whom we are apt to take as the typical figure
of a prophet in the old kingdom, has little in common with the
picture even of the true prophet which we derive from 1 Kings
xxii.; and when his history is carefully and critically read it is
found to give no reason to think that he stood in any close
relation to the prophetic societies of his time. He is a man of
God, like Moses and Samuel, a man admitted to a strange and
awful intimacy with the Most High, and like them he combines
functions which in later times were distributed between prophet
and priest. The fundamental idea that Yahweh guides His people
by the word of revelation is older than the separation of
special classes of theocratic organs; Moses, indeed, is not only
prophet and priest, but judge and ruler. But, as the history goes
on, the prophet stands out more and more as the typical organ
of revelation, the type of the man who is Yahweh’s intimate,
sharing His secrets (Amos iii. 7; Jer. xxiii. 22), and ministering
to Israel the gracious guidance which distinguishes it from all
other nations (Amos ii. 11; Hosea xii. 10, 13), and also the
sentences of awful judgment by which Yahweh rebukes rebellion
(Hos. vi. 5). The full development of this view seems to lie
between the time of Elijah and that of Amos and Hosea—under
the dynasty of Jotham, when prophecy, as represented by Elisa,
truly came to the fore. This was the final great outburst of the
nationalistic efforts of the age. This growth in the conception of
the prophetic function is reflected in parts of the Pentateuch, which
may be dated with probability as belonging to the period just
named; the name of nébbî² is extended to the patriarchs as
Yahweh’s intimates (Gen. xx. 7), and Moses begins to be chiefly
looked at as the greatest of prophets (Num. xi., xii.; Deut. xxiv.
10), while Aaron and Miriam are also placed in the same class
(Exod. xv. 20; Num. xii.), because they too are among the
divinely favoured leaders of Israel (cf. Micah vi. 4).³

¹ Bude (Bächer Samuélus, p. 233) assigns Nathan’s speech
(2 Sam. vii.) to a late E. writer in the 7th century. Perhaps we might
assign it and Jer. xxiii. 5, 6, to the earlier part of Josiah’s reign.
² None of these passages belong to the very oldest thread of Proph.
Books, but they occur in the similar Davidic Psalms. Thus,
in the later account (Judg. iv. 4), not in the song (Judg. v.). It is
characteristic that in Num. xi. the elders who receive a share in
Moses’ task also receive a share of his prophetic spirit (cf. the
parallel 2 Kings ii. 9 seq.). Again in the other account (Exod. xlvii.)
this is not so. Again, Moses differs from all other prophets in that
Yahweh speaks to him face to face, and he sees the similitude of
Yahweh. This is in fact the difference between him and Elijah

Elisha, the successor of Elijah, stood in much closer relations
to the prophetic societies than his great master had done. As
a man of practical aims he required a circle through
which to work, and he found this among the prophets,
or, as they are now called, the sons of the prophets. According
to Semitic idiom “sons of the prophets” most naturally means
“members of a prophetic corporation,”⁴ which may imply that
under the headship of Elisha and the favour of the dynasty
of Jehu, which owed much to Elisha and his party, the prophetic
societies took a more regular form than before. The accounts
we have certainly point in this direction, and it is characteristic
that in 2 Kings iv. 42 first-fruits are paid to Elisha. But to
an institution like prophecy national recognition, royal favour
and fixed organization are dangerous gifts. It has always been
the evil fate of the Hebrews to destroy their own highest ideals by
attempting to translate them into set forms, and the ideal of a
prophetic guidance of the nation of Yahweh could not have been
more effectually neutralized than by committing its realization
to the care of some kind of state Church of professional prophets, “eating
bread” by their trade (Amos vii. 12),⁵ which claimed to inherit
the traditions of Elijah and Elisha. The sons of the prophets
appear to have been grouped round the leading sanctuaries,
Gilgal, Bethel, and the like (cf. Hos. ix. 8), and to have stood
in pretty close relation to the priesthood (Hos. iv. 5), though
this comes out more clearly for the southern kingdom, where,
down to the last days of Hebrew independence, the official
prophets of Jerusalem were connected with the Temple and were
under the authority of the chief priest (Jer. xxix. 26). Since
the absorption of the aborigines in Israel Canaanite ideas had
exercised great influence over the sanctuaries—so much so
that the reforming prophets of the 8th century regarded the
national religion as having become wholly heathenish; and this
influence the ordinary prophets, whom a man like Micah regards
as mere diviners, had certainly not escaped. They too were,
at the beginning of the Assyrian period, not much more different
from prophets of Baal than the priests were from priests of Baal.
Their God had another name, but it was almost forgotten that He
had a different character.

The rise and progress of the new school of prophecy, beginning
with Amos and continued in the succession of canonical prophets,
which broke through this religious stagnation, is Amos
and his Successors. discussed in the article HEBREW RELIGION; for from
Amos, and still more from Isaiah downwards, the new
prophets and their work made up the chief interest of Hebrew
history. From this time, moreover, the prophets appear as
authors; and their books, preserved in the Old Testament,
form the subject of special articles (Amos, Hosea, &c.). A few
observations of a general character will therefore suffice in
this place.

Amos disclaimed all connexion with the mere professional
prophets, and in this he was followed by his successors.
Formerly the prophets of Yahweh had been all on the same side; their
opponents were the prophets of Baal. But henceforth there
were two parties among the prophets of Yahweh themselves,
the new prophets accusing the old of imposture and disloyalty
to Yahweh, and these retaliating with charge of disloyalty
to Israel. We have learned to call the prophets of the new
school “true” prophets and their adversaries “false”; and this
is perfectly just if we take the appellations to mean that the true
prophets maintained a higher, and therefore a truer, view of
(cf. Exod. xxxiii. 8—11 with 1 Kings xix. 13), but not between
him and the great prophets of the 8th century (Isa. vi. 5). That
prophets was generally given in visions, dreams and obscure
sentences of a true prophet, and, indeed, in early times. Amos still
had occasional visions of a more or less enigmatic character, as Micaiah had,
but there is little trace of this in the great prophets after him. On the
psychological reasons adduced for this see W. R. Smith, Prophets of Israel
(2d ed. 1884), pp. xi., xliii.

⁴ See G. Hoffmann, Kirchengesammle zu Ephesus (1873), p. 89.
⁵ Those who consulted the old seers were expected to make a
present, 1 Sam. ix. 7 (Arabic bohûnî-l-khâri; cf. Bohari iv.
216). Similar presents were brought to the older prophets (1 Kings
xiv. 3), and first-fruits were sometimes paid to a man of God; but the
successors of Amos share his contempt for those who traded on their
(oracles) (Mic. iii. 5 seq.).
PROPHET

Yahweh’s character, purpose and relation to His people. But the false prophets were by no means mere common impostors; they were the sincere exponents of the existing theology of their day, for the prophets who opposed Jeremiah took their stand on the ground of the prophetic traditions of Isaiah, whose doctrine of the inviolability of Yahweh’s seat on Zion was the starting-point of their opposition to Jeremiah’s predictions of captivity. No doubt there were many conscious hypocrites and impostors among the professional prophets, as there always will be among the professional representatives of a religious standpoint which is intrinsically untenable, and yet has on its side the prestige of tradition and popular acceptance. But on the whole the false prophets deserve that name, not for their conscious impostures, but because they were content to handle religious formulas, which they had learned by rote, as if they were intuitive principles, the fruit of direct spiritual experience, to enforce a conventional morality, shutting their eyes to glaring national sins, after the manner of professional orthodoxy, and, in brief, to treat the religious status quo as if it could be accepted without question as fully embodying the unchanging principles of all religion. The popular faith was full of heathenistic superstition strangely blended with the higher ideas which were the inheritance left to Israel by men like Moses and Elijah; but the common prophets accepted all alike, and combined heathen arts of divination and practices of mere physical enthusiasm with an altogether insincere pretension that through their professional capacity they had the means of a continuous divine guidance of the people of Yahweh.

Amos and his successors accepted the old ideal of prophecy if they disowned the class which pretended to embody it. “The Lord Yahweh will do nothing, but He revealeth His secret to His servants the prophets.” “By a prophet Yahweh brought Israel out of Egypt, and by a prophet” in each successive age Israel had been watched over and preserved. But in point of fact the function of the new prophecy was not to preserve but to destroy Israel, if Israel still meant the actual Hebrew nation, with its traditional national life. Till Amos (with the solitary exception of Micaiah ben Imlah, in 1 Kings xxii.) prophecy was optimist—even Elijah, if he denounced the destruction of a dynasty and the annihilation of all who had bowed the knee to Baal, never doubted of the future of the nation when only the faithful remained; but the new prophecy is pessimist—it knows that Israel is rotten to the core, and that the whole fabric of society must be dissolved before reconstruction is possible. And this it knows, not by a mere ethical judgment on the visible state of society, but because it has read Yahweh’s secret written in the signs of the times and knows that He has condemned His people. To the mass these signs are unintelligible, because they deem it impossible that Yahweh should utterly cast off His chosen nation; but to those who know His absolute righteousness, and confront it with the people’s sin, the impending approach of the Assyrian is a threat and can point only to one issue, viz. the total ruin of the nation which has denied its divine head. It is sometimes proposed to view the canonical prophets as simple preachers of righteousness; their predictions of woe, we are told, are conditional, and tell what Israel must suffer if it does not repent. But this is an incomplete view; the peculiarity of their position is that they know that Israel as it exists is beyond repentance. Only, while they are hopeless about their nation they have absolute faith in Yahweh and His purpose. That cannot be frustrated, and, as it includes the choice of Israel as His people, it is certain that, though the present commonwealth must perish, a new and better Israel will rise from its grave. Not the reformation but the resurrection of Israel is the goal of the prophets’ hope (Hos. vi. 1 seq.).

This of course is only the broadest possible statement of a position which undergoes many modifications in the hands of individual seers, but on the whole governs all prophecy from Amos to Jeremiah. The position has, we see, two sides: on the one side the prophets are heralds of an inexorable judgment based on the demands of absolute righteousness; on the other they represent an assured conviction of Yahweh’s invincible and gracious love. The current theological formula for this two-sided position is that the prophets are at once preachers of the law and forerunners of the gospel, and, as it is generally assumed that they found the law already written, their originality and real importance is made to lie wholly in their evangelical function. But in reality as has been shown in the article on Hebre Religion, the prophets are older than the law, and the part of their work which was really epoch-making for Israel is just the part which is usually passed over as unimportant. By emphasizing the purely moral character of Yahweh’s demands from Israel, by teaching that the mere payment of service and worship at Yahweh’s shrines did not entitle Israel’s sins to be treated one whit more lightly than the sins of other nations, and by enforcing these doctrines through the conception that the approach of the all-destroying empire, before which Israel must fall equally with all its neighbours, was the proof of Yahweh’s impartial righteousness, they gave for the first time a really broad and fruitful conception of the moral government of the whole earth by the one true God.

It is impossible to read the books of the older prophets, and especially of their protagonist Amos, without seeing that the new thing which they are compelled to speak is not Yahweh’s grace but His inexorable and righteous wrath. That that wrath must be followed by fresh mercies is not in itself a new thought, but it is the necessary expression of the inherited conviction that Yahweh whom they speak as the judge of all the earth, is nevertheless, as past history has proved, the God who has chosen Israel as His people. That this is so appears most clearly in the fact that with Amos the prophecy of restoration appears only in a few verses at the end of his book, and in the still more instructive fact that neither he nor Hosea attempts to explain how the restoration which they accept as a postulate of faith is to be historically realized. Recent critics, however, viz. Wellhausen, Nowack, Marti and Harper, as well as others, have denied the genuineness of the concluding verses in Amos, viz. ix. 8–15. To Hosea, at least in his later prophecies, the fate of Judah does not appear separable from that of the northern realm—when Israel and Ephraim fall by their iniquity Judah must fall with them (Hos. v. 5). Thus even on this side there is no real bridge over the chasm that separates the total ruin impending over the Israel of the present from the glorious restoration of the Israel of the future. There is a unity in the divine purpose, of which judgment and mercy are the two poles, but there is as yet no conception of an historical continuity in the execution of that purpose, and therefore no foundation laid for the maintenance of a continuous community of faith in the intermediate years.

From this we can see the enormous importance of the work of Isaiah as it has been exhibited in the article Hebrew Religion; his doctrine of the remnant, never lost to the nation in the worst times, never destroyed by the most fiery judgments, supplies the lacking element of continuity between the Israel of the present and of the future. Yahweh’s kingdom cannot perish even for a time; nay, Isaiah argues that it must remain visible, and visible not merely in the circle of the like-minded whom he had gathered round him and who formed the first germ of the notion of the church, but in the political form of a kingdom also. Zion at least, the sacred hearth of Yahweh, the visible centre of His kingdom,

\[1\] It must not be supposed that this conception necessarily came into force as soon as it was recognized that Yahweh was the creator of the universe. That the national or tribal god is the creator is an idea often found in very low religions. To us God’s sovereignty over nature often seems the hardest thing to conceive; but to primitive peoples who know nothing of laws of nature, His moral sovereignty is a much more difficult conception. In the older literature of the Hebrews, the nearest approach to the thought of Amos and Hosea is not Gen. ii., iii., but Gen. xviii. 25.
must remain inviolable; it can never be delivered into the hands of the Assyrian. Thus, with Isaiah in the days of Sennacherib's invasion, the prophetic word became again, as it had been in the days of the Syrian wars, "the chariots and horsemen of Israel," the stay and strength of all patriotic hope.

Yet even at this crisis the resemblance between Isaiah and Elisha, between the new prophecy and the old, is more apparent than real. Elisha still stands firmly planted on the old national conception of the religion of Yahweh; his ideals are such as do not lie beyond the range of practical politics. In doing battle against the Tyrian Baal he is content with a reformation for which the whole nation can be heartily won, because it makes no radical change in their inherited faith and practices of worship. And in stimulating resistance to Syria he is still the prophet of the old "God of the hosts of Israel"—a God who works deliverance by the threes and sinews of His earthly warriors. But Isaiah's ideal of religion was one for which he himself demands as a preliminary condition an outpouring of Yahweh's spirit on king (Isa. xv. 2) and people (Isa. xxxii. 15), working an entire moral regeneration. And so too it is not through the material organization of the Judean kingdom that Isaiah looks for deliverance from Assyria. He sees with absolute cleanness the powerlessness of the little realm against that great empire: the Assyrian must fall, and fall before Jerusalem, that Yahweh alone may appear to all the earth as the one true God, while all the idols appear as vain to help their worshippers. These conceptions break through the old particularistic idea of Yahweh and His religion at every point. Zion is now not the centre of a mere national cult, but the centre of all true religion for the whole world; and more than once the prophet indicates not obscurely that the necessary issue of the great conflict between Yahweh and the gods of the heathen must be the conversion of all nations, the disappearance of every other religion before the faith of the God of Israel. The pre-exilic origin of Isa. ii. 4 which announces that all foreign nations shall stream towards the exalted mountain of Yahweh's temple is maintained by Duhm but is denied by many recent critics including Cornill. But this all-conquering religion is not the popular Yahweh-worship; why then can the prophet still hold that the one true God is yet the God of Israel, and that the vindication of His Godhead involves the preservation of Israel? Not because His providence is confined to Israel—it embraces all nations; not because He shows any favouritism to Israel—He judges all nations by the same strict rule. If Israel alone among nations can meet the Assyrian with the boast "with us is God," the reason is that in Zion the true God is known—not indeed to the mass, but to the prophet, and that the "holy seed" or "remnant" (contained in the name She'ar yashāb) which forms the salt of the nation. The interpretation which Isaiah puts on this fact depends on the circumstance that at that date religion had never been conceived as a relation between God and individuals, or as a relation between God and a purely spiritual society, but always as a relation between a deity and some natural social group—a stock, a tribe, a family. It is this idea of the people as the subject of Yahweh's love, and of the one hand the little society of faith—which had not in reality the least tinge of political coherence—is thought of as yet forming the true kernel of the nation qua nation, while on the other hand the state of Judah profits by the prophetic religion inasmuch as the nation must be saved from destruction in order that the prophetic faith—which is still bound up with the idea of the nation—may not be dissolved. This connexion of ideas was not of course explicitly before the prophet's mind, for the distinctive features of a national religion could not be formulated so long as no other kind of religion had ever been heard of. When we put down in black and white the explicit details of what is involved in Isaiah's conclusion of faith we see that it has no absolute validity. True religion can exist without having a particular nation as its subject as soon as the idea of a spiritual community of faith has been realized. But till this was realized Isaiah was right in teaching that the law of continuity demanded that the nation within which Yahweh had made Himself known to His spiritual prophets must be maintained as a nation for the sake of the glory of God and the preservation of the "remnant."

The withdrawal of Sennacherib's army, in which the doctrine of the inviolability of Zion received the most striking practical confirmation, was welcomed by Isaiah and his disciples as an earnest of the speedy incoming of the new spiritual era. But these hopes were not fulfilled. The prophetic teaching had indeed produced a profound effect; to the party of reaction, as the persecution under Manasseh shows, it seemed to threaten to subvert all society; and we can still measure the range and depth of its influence in the literary remains of the period from Isaiah to the captivity, which include Micah vi. 1-8; and that noble essay to build a complete nation code on the principle of love to God, righteousness, and humanity—the legislation of Deuteronomy. Nay more, the reception of the book of Deuteronomy by king and people in the eighteenth year of Josiah shows what a hold the prophetic teaching had on the popular conscience. It was no small triumph that there was even a passing attempt to introduce such a code as the law of the land. But it was one thing to touch the conscience of the nation and another to change its heart and renew its whole life. That no code could do, and, as every practical government must adapt itself to actualities and not to a purely ideal standard, it must have appeared at once that the attempt to govern by prophetic ideas was only sewing a new piece on an old garment. The immediate result of Josiah's reformation was the complete dissolution of anything that could be called a political party of prophetic ideas; the priests and the ordinary prophets were satisfied with what had been accomplished; the old abuses began again, but the nation had received a reformed constitution and there was nothing more to be said.

Thus it was that, though beyond question there had been a real advance in the average ethical and spiritual ideas of the people since the time of Issiah, Jeremiah found himself more isolated than Isaiah had ever been. Even in that earliest part of his book which is mainly a recapitulation of his experiences and work in the reign of Josiah, his tone is one of absolute hopelessness as to the future of the nation. But we should quite misunderstand this pessimism if we held it to mean that Jeremiah saw no signs of private morality and individual spiritual convictions among his people. To him as a prophet the question was whether Israel as a nation could be saved. In Isaiah's days the answer had been affirmative; there appeared to be at least a potentiality of national regeneration in the holy seed when once it should be cleansed from the defilement of the king, and in the eighteenth year of Josiah thezekiah's views of the nation were not far from the present. It may be, then, that Jeremiah also saw no signs of valid national repentance and restoration. But, as Coleridge says, "while a second resurrection of the whole nation was hopeless, yet there was a hope of some of the children of Israel, and this was the hope of the Messianic Kingdom."

The harvest was past, the season of ripe fruits was over, and still Israel was not saved (Jer. viii. 20). The time of respite had been wasted, all attempts at national reformation had failed; how should Yahweh spare a nation which had shown no tokens of fitness to discharge the vocation of Yahweh's people? The question was not whether there was still a faithful remnant, but whether that remnant was able to save the state as a state, and this Jeremiah was forced to deny. Nay, every attempt at genuine amendment was frustrated by the dead weight of a powerful opposition, and when the first captivity came it was precisely the best elements of Judah that went into captivity and were scattered among the nations (xxiv. 5, xxviii. 2 seq.). And so the prophet was compelled to teach that the immediate future of Israel was blank, that the state as a state was doomed. He did not even dare to intercede for such a nation (vii. 16); though Moses and Samuel stood pleading for it before Yahweh, He could not but cast it out of His sight (vii. 1). It was the death-struggle of the idea of a national religion (vi. 8);
the continuity of true faith refused to be longer bound up with the
continuity of the nation. Still indeed the New-Testament idea
of a purely spiritual kingdom of God, in this world but not of
it, is beyond the prophet's horizon, and he can think of no
other vindication of the divine purpose than that the true
Israel shall be gathered again from its dispersion. But the
condition of this restoration is now changed. To gather the
dispersed implies a call of God to individuals, and in the restored
Israel the covenant of Yahweh shall not be merely with the
nation but with man one by one, and they shall no more teach
everyone his neighbour saying, Know the Lord, for all shall
know Me from the least of them even to the greatest of them"
(xxxi. 33 seq.). In a word, when the nation is dissolved into its
individual elements the continuity and ultimate victory of
true faith depends on the relation of Yahweh to individual souls,
out of which the new state shall be built up [Jer iii. 14].

Thus, for the first time in the world's history, the ultimate
problem of faith is based on the relation of God to the individual
believer; and this problem Jeremiah is compelled to face mainly
in relation to his own personality, to assure himself that his own
faith is a true possession and lifts him above all the calamities
that assail him, in spite of the hopeless ruin of his nation. The
struggle is a sore one; his very life is bitter to him; and yet he
emerges victorious. To know that God is with him is enough
even though all else fail him. Now as soon as the relation of God
to a single soul has thus been set free from all earthly conditions
the work of prophecy is really complete, for what God has done
for one soul He can do for all, but only by speaking to each
believer as directly as He does to Jeremiah. Henceforth revelation
is not a word to the nation spoken through an individual, but a
word spoken to one which is equally valid for every one who
receives it with like faith. The New Testament joins on not
to the post-exilic prophets, who are only faint echoes of earlier
seers, but to Jeremiah's great idea of the new covenant in which
God's law is written on the individual heart, and the community
of faith is the fellowship of all to whom He has thus spoken.
The prophets of the restoration are only the last waves beating
on the shore after the storm which destroyed the old nation,
but created in its room a fellowship of spiritual religion, had
passed over; they resemble the old prophets in the same imperfect
way in which the restored community of Jerusalem resembled
a real nation. It was only in so far as the community of faith
still possessed certain external features of nationality that post-
exilic prophecy was possible at all, and very soon the care of the
national or quasi-national aspects of religion passed altogether
out of their hands into those of the scribes, of whom Ezekiel
was the first father, and whose Torah was not the living word
of prophecy but the Pentateuchal code. From the time of
Jeremiah downwards the perennial interest of Old-Testament
thought lies in the working out of the problems of personal
religion and of the idea of a spiritual fellowship of faith transc-
scending all national limitation; and these are the motes not
only of the lyrics of the Psalter but of the greater theoideas of
Isa. xl.–lxi. and of the book of Job. The theoidea of
the prophets is national; they see Yahweh's righteousness
working itself out with unmistakable clearness in the present,
and know that all that He brings upon Israel is manifestly just;
but from the days of Jeremiah the fortunes of Israel as a nation
are no longer the one thing which religion has to explain; the
great question arises of a theory of the divine purpose which
shall justify the ways of God with individual men or with His
"righteous servant."—that is, with the ideal community of
true faith as distinct from the national Israel.

It will be evident even from this rapid sketch, necessarily
confined to a few of the most cardinal points, that Hebrew
prophecy is not a thing that can be defined and reduced to a
formula, but was a living institution which can only be under-
stood by studying its growth and observing its connexion with
the historical movements with which its various manifestations
were bound up. Throughout the great age of prophecy the most
obvious formal character that distinguished it was that the

1 One might say from the days of Habakkuk.

prophet did not speak in his own name but in the name of
Yahweh. But the claim to speak in the name of God is one
which has often been made—and made sincerely—by others
than the prophets of Israel, and which is susceptible of a great
variety of meanings, according to the idea of God and His
relation to man which is presupposed. Every early religion
seeks to realize such an intercourse with the object of worship
as shall be two-sided; when the worshipper approaches the deity
he desires to have an answer assuring him of acceptance and
divine aid. The revelation thus looked for may be found in
natural omens, in the priestly lot or some similar sacral oracle,
or, finally, in the words of a seer who is held to be in closer
contact with the deity than common men. Broadly speaking
these methods of revelation are found in all ancient religions,
but no other religion presents anything precisely analogous to
prophecy. It is true that the prophets absorbed the old seers,
and that the Israelites, as we see in the case of the asses of
Kish, went to their seers on the same kind of occasions as sent heathen
nations to seers or diviners. There is sufficient evidence that
down to the last age of the Judaean monarchy not essentially different from
divination were current in all classes of society, and were often in the hands of men who claimed
to speak as prophets in the name of Yahweh. But the great
prophets disallowed this claim, and the distinction which they
drew between true prophecy and divination is recognized not
only in the prophetic law of Deuteronomy but in earlier parts
of the Pentateuch and historical books. "There is no augury
in Jacob and no divination in Israel; in due time it is told to
Jacob and to Israel what God doth work" (Num. xxiii. 23).
The seer, in the sense in which all antiquity believed in seers, is
simply a man who sees what others cannot see, no matter
whether the thing seen be of public or of mere private interest;
but the prophet is an organ of Yahweh's kingship over His
people—he sees and tells so much of the secret purpose of
Yahweh as is needful for His people to know. We have already seen
how Amos and Hosea put this (supra, p. 211), and it does not appear
that they were introducing a conception of prophecy formally novel—the new thing was their conception of
Yahweh's purpose. And so too with the following great prophets;
the important thing in their work was not their moral earnestness
and not their specific predictions of future events, but the clear-
ness of spiritual insight with which they read the spiritual
significance of the signs of the time and interpreted the move-
ments of history as proofs of Yahweh's actual moral sovereignty
exercised over Israel. So long as the great problems of religion
could be envisaged as problems of the relation of Yahweh to
Israel as a nation the prophets continued to speak and to bring
forth new truths; but the ultimate result was that it became
apparent that the idea of moral government involved the destruc-
tion of Israel, and that the function of prophecy was gone
because it was essentially national in its objects. But meantime
the relation of God to the prophet had acquired an independent
significance; the inner life of Isaiah during the long years when
his teaching seemed lost, or of Jeremiah through the whole
course of his seemingly fruitless ministry, was rich in experiences of
faith triumphing over temptations and trials, of personal
converse with God sustaining the soul in the face of difficulties
hopeless to the eye of sense, which formed the pattern of a new
and higher stage of religion in which the relation of the individual
soul to God should be set free from those limitations which had
been imposed by the conception that the primary subject of
religion is the nation. But the religion of the Old Testament
did not become merely individualistic in becoming individual,
and now the problem was to realize a new conception of the
society of faith, the true Israel, the collective servant of Yahweh
—in a word to form the idea of a spiritual commonwealth and
to show how it was possible for faith to hold fast, in spite of all
seeming contradiction, to the truth that Yahweh had chosen
for himself a spiritual people, every member of which was in
truth the object of His saving and unfailing love, and which
should ultimately in very deep inherit that glory of which the
carnal Israel was unworthy. This is the post-prophetic problem.
which occupies the more profound of the later Old-Testament books, but first received its true solution in the gospel, when the last shreds of the old nationalism disappeared and the spiritual kingdom found its centre in the person of Christ.

Old-Testament prophecy therefore forms only one stage in a larger development, and its true significance and value can only be realized when it is looked at in this light. In this as in all other matters of transcendental truth "wisdom is justified of her children"; the conclusive vindication of the prophets as true messengers of God is that their work forms an integral part in the progress of spiritual religion, and there are many things in their teaching the profundity and importance of which are much clearer to us than they could possibly have been to their contemporaries, because they are mere flashes of spiritual insight lighting up for a moment some corner of a region on which the steady sun of the gospel had not yet risen.

A less complete but yet most powerful vindication of the spiritual prophetic force in the course and event of Israel's history. After the captivity it was no longer a question that the prophetic conception of Yahweh was the only possible one. Thenceforth the religion of Yahweh and the religion of the prophets are synonymous; no other reading of Israel's past was possible, and in fact the whole history of the Hebrews in Canaan, as it was finally shaped in the exile, is written from this point of view, and has come down to us, along with the remains of actual prophetic books, under the collective title of "The Prophets."

To some extent this historical vindication of the prophetic insight went on during the activity of the prophets themselves. From the time of Amos downwards the prophets spoke mainly at great historical crises, when events were moving fast and a few years were often sufficient to show that they were right and their opponents wrong in their reading of the signs of the times. And here the controversy did not turn on the exact fulfilment of particular predictions, but detailed prediction occupies a very secondary place in the writings of the prophets.

The prophets themselves required no historical verification of their word to assure them that it was indeed the word of God, nor do they for a moment admit that their contemporaries are entitled to treat its authority as unproved till such verification is offered. The word of God carries its own evidence with it in its searching force and fire: "Is not my word like a fire, saith Yahweh, and like a hammer that breaketh the rock in pieces?" (Jer. xviii. 20). To the prophet himself it comes with imperious force: it constrains him to speak (Amos iii. 8), seizes him with a strong hand (Isa. viii. 11), burns like a fire within his bones till it finds utterance (Jer. xx. 9); and it is this force of moral conviction which ought also to commend it to the conscience of his hearers. The word is true because it is worthy of the true God. When Deut. xviii. 19, 22 seeks the legal criterion of the origin of prophecy, it turns back to the witness for the fulfillment of prophecy, the writer is no doubt guided by the remembrance of the remarkable confirmation which the doctrines of spiritual prophecy had received in history then recent, but his criterion would have appeared inadequate to the prophets themselves, and indeed this passage is one of the most striking proofs that to formulate the principles of prophetic religion in a legal code was an impossible task.

The mass of the nation, of course, was always much more struck by the "signs" and predictions of the prophets than by their spiritual ideas; we see how the idea of supernatural insight and power in everyday matters dominates the popular conception of Elijah and Elisha in the books of Kings. At a very early date the great prophets became a kind of saints or Ezizis, and the respect paid to the tombs of the prophets, which ultimately took in almost every particular the place of the old local shrines (Matt. xxiii. 29; Jerome, Epit. Paulae, § 133; see Obidian), can be traced back to the time before the exile.1

The Hebrew prophet stands alone among divinely inspired men of any religion, though analogies in other religions present themselves. Ethical and religious teachers arose among other nations of antiquity whose precepts may well be compared with those of Hebrew prophecy. We might cite the maxims of Ani in the Egyptian papyrus Prisse (XIIth dynasty). But these teachers did not succeed in accomplishing a task parallel to what the Hebrew prophets achieved, namely, the complete renewal and elevation of the Hebrew religion from a local and national into a universal and ethical religion. Yet instructive parallels may be found in ancient literatures. Thus the Vedic hymns are reputed to have no human authors. The names attached to them are those of the seers who "saw" them, to whom they were revealed. They are therefore merely the channels through which the divine word is communicated to man (Professor Rapson). The Rev. C. H. W. Johns (Interpreter, April 1906, "The Prophets of Babylonia") thinks that longer discourses moral, and predictive, fully equal to those of the Hebrew prophets, were found in the Enoch (B.C. 600-300) but were curtained into the brief sentences of the omen tablets. "The so-called 'tablet of warning to kings against injustice' gives a fair specimen of connected discourse, e.g. 'If a king hearken not to law, his people shall grow feeble and his land be ravaged. If he attend not to the justice of his land, Ea, the king of the gods, shall disturb his lot, &c.' Further illustrations of ethical teaching may be found in the litany or confession of a penitent cited by Mr Johns in the same paper (p. 303).

It may be here stated that Winckler's conception of the Hebrew prophet Isaiah as the mouthpiece of the Assyrian court (K.A.T. 4. p. 172 sqq.) can be easily refuted by a reference to the Isaianic oracles. A theory that Jeremiah was similarly influenced from Babylonia might seem more plausible, though equally baseless.

After the extinction of the prophetic voice, an ever-increasing weight was not unnaturally laid on the predictive element in the prophetic writings. Their creative religious ideas had become the common property of religious-minded Jews, at least, in the somewhat imperfect shape in which they were embodied in the law, and their work on this side was carried on by the great religious poets. But the restored community which was still making a sort of faint attempt to be a religious nation as well as a Church felt very painfully the want of a direct message from God in critical times such as the prophets of old had been wont to bring. And in this need men began to look at the prophetic books, mainly in the hope that there might be found in them predictions which still awaited fulfilment, and might be taken as referring to the latter days of Persian or Greek oppression. By ignoring the free poetical form of prophecy, and still more by ignoring the fact that the prophetic pictures of the ideal future of Israel could not be literally fulfilled after the fall of the ancient state had entirely changed the sphere in which the problems of true religion had to be worked out, it was possible to find a grove mass of unfulfilled prophecy which might form the basis of eschatological constructions. All this was quite in the vein of later Judaism, and so at length the unfulfilled predictions of the prophets served as the raw material for the elaborate eschatology of the apocalypses (see Apocalyptic Literature). In spite of superficial resemblances, mainly due to the unavoidable influence of current exegetical methods, the conception of prophecy as fulfilled in Christ is fundamentally different from the Jewish apocalyptic view of unfulfilled prophecy. Not external details but the spiritual ideas of the prophets find their fulfilment in the new dispensation, and they do so under forms entirely diverse from those of the old national kingdom of Yahweh.

1 See 2 Kings xxiii. 21, and also Deut. xxxiv. 6. So too all the old national heroes and heroines ultimately became prophets; in the case of Deborah there is even a fusion in local tradition between an ancient heroine and an historical seer.
which has continued to influence certain circles down to the present day, and has led to the most varied attempts to find in prophecy a history written before the event of all the chief vicissitudes of the Christian Church down to the end of the world. On the other hand Louthan’s Lectures on Hebrew Poetry, and the same author’s Commentary on Isaiah (1778), show the beginnings of a tendency to look mainly at the aesthetic aspects of the prophetic books, and to view the prophets as enlightened religious poets. This tendency culminates in Eichhorn, *Drei hebräischen Propheten* (1816). Neither method did anything for the understanding of the phenomena of prophecy as a whole, and the more liberal students of the Old Testament were long blinded by the moralizing, unhistorical rationalism which succeeded the old orthodoxy. The first requisite of research (already appreciated, as we have seen, by Eichhorn) was to get a living conception of the history in which the prophets moved; and this again called for a revision of all traditional notions as to the age of the various parts of Hebrew literature—criticism of the prophecy, in other words, and the history, and the prophets themselves take the first place. In recent times therefore in advance in the understanding of the prophets has moved on pari passu with the higher criticism, especially the criticism of the Pentateuch, and with the general study of Hebrew history; and most works on the subject prior to Ewald must be regarded as quite antiquated except for the light they cast on details of exegesis. On the prophets and their works the reader would still do well to consult Ewald’s *Propheiten des allen Bundes* (1st ed., 1840-1841, 2nd ed., 1856) and Giesebrecht, *Christ manifesting himself* (1873), of which the English translation is *Ewald’s Prophecies of the Old Testament* (1876-1877). The general works on Old Testament introduction (among which Kuenen’s *Onderzoek* ed., vol. ii., claims the first place), and on Old Testament theology (see especially Vatke, *Religion des A.T.*, 1835). On the theology of the prophets there is a work by R. Smith, *The Prophets of Israel* (Edinburgh, 1882). The literature of the theological questions connected with prophecy is much too copious to be cited here; lists will be found in several of the books already referred to. Among more recent works may be mentioned, J. Delitzsch, *Apostolisch hebräische Giebeschrieb*, *Die Berufsbegabung der alttestamentlichen Propheten*; Volz, *Die vorreform. Propheten* u. der Messias; Hahn, *Die messianischen Weissagungen*; R. Kittel, *Prophetie u. Weissagung*; Professor Kennett, *Freunde der Prophetie*; W. H. Smith, *Poetische Prophezeiungen*; and T. Clark, A. B. Didschens, *Prophezeiungen* etc., in *Hastings’ Dict. Bible*; the *Propheten* and *Prophezeiungen* by Cheyne and others in Encyc. Bibl. (W. R. S.; O. C. W.)

II. Prophets in the Primitive Church.—The appearance of prophets in the first Christian communities is one proof of the strength of faith and hope by which these bodies were animated. An old prophecy (Joel iii. 1) has foretold that in the Messianic age the Spirit of God would be poured out on every member of the religious community, and in point of fact it was the universal conviction of those who believed in Christ they all possessed the Spirit of God. This Spirit, manifesting His presence in a variety of ways and through a variety of gifts, was to be the only ruling authority in the Church. He raised up for Himself particular individuals, into whose mouths He put the word of God, and these were at first regarded as the true leaders of the congregations. We find accordingly that there were prophets in the oldest church, of that of Jerusalem (Acts xi. 27, xv. 32), and again that there were “prophets and teachers” in the church at Antioch (Acts xii. 1). These were not office-bearers chosen by the congregation, but preachers raised up by the Spirit and conferred as gifts on the Church. When Paul says (1 Cor. xii. 28; cf. Eph. iv. 11), “God hath set some in the Church, first apostles, secondarily prophets, thirdly teachers, the points to a state of things which in his time prophets and teachers in the Church were of Jewish and heathen origin. We here learn from Paul that the prophets occupied the position in point of dignity; and we see from another passage (1 Cor. xiv.) that they were distinguished from the teachers by their speaking under the influence of inspiration—not, however, like the “speakers in tongues,” in unintelligible ejaculations and disconnected words, but in articulate, rational edifying speech. Until recently it was impossible to form any distinct idea of the Christian prophets in the post-apostolic age, not so much from want of materials as because what evidence existed was not sufficiently clear and connected. It was understood, indeed, that they had maintained their place in the churches till the end of the 2nd century, and that the great conflict with what is known as Montanism had first proved fatal to them; but a clear conception of their position and influence in the churches was not to be had. But the discovery, by Bryennios in 1875., of the ancient Christian work called *Διάδεξι* των διάδεξαρν κοσμητών (published in 1883), has immensely extended the range of our knowledge, and has at the same time thrown a clear light on many notices in other sources which for want of proper interpretation was before neglected or incorrectly understood.

The most important facts known at present about the manner of life, the influence, and the history of the early Christian prophets are the following: (1) Until late in the 2nd century the prophets (or prophetesses) were regarded as an essential element in a Church possessing the Holy Ghost. Their existence was believed in, and they did actually exist, not only in the catholic congregations—if the expression may be used—but also in the Marcionite Church and the Gnostic societies. Not a few Christian prophets are known to us by name: as Agabus, Judas, and Silas in Jerusalem; Barnabas, Simon Niger, &c., in Asia; and Minnie, the daughter of Philip, Quadratus, Ammonius Polycarp, Melito, Montesius, Maximus, and Philo of Alexandria; in Rome, Hermas; among the followers of Basilides, Barbakbas and Barkoph; in the community of Apelles, Philumene, &c. Lucian tells us that the impostor Peregirinus Protes, in the time of Antonius Pius, figured as a prophet in the Christian churches of Syria. (2) Till the middle of the 2nd century the prophets were the regular preachers of the churches, without being attached to any particular congregation. While the “apostles” (i.e. itinerant missionaries) were obliged to preach from place to place, the prophets were at liberty either, like the teachers, to settle in a certain church or to travel from one to another. (3) In the time of Paul the form of prophecy was reasoned exhortation in a state of inspiration; but very frequently the inspiration took the form of ecstasy—the prophet lost control of himself, so that he did not remember afterwards what he had said. In the Gentile-Christian churches, under the influence of pagan associations, ecstasy was the rule. (4) With regard to the matter of prophecy, it might embrace anything that was necessary or for the edification of the Church. The prophets not only knew the present and the future, but they were able to interpret the signs of the times. What now are expressed in the New Testament as the gifts of the Holy Ghost are in the Old Testament under a different name: Jean-Paul, *The Prophecy of the Holy Ghost*. (5) It was the duty of the prophets to follow in all respects the example of the Lord (ἐν διάδεξι τοῦ τρόπον τοῦ Κυρίου), and to put in practice what they preached. But an ascetic life was expected of them only when, like the apostles, they went about as missionaries, in which case the rules in Matt. x. applied to them. Whenever, on the contrary, they settled in a place they had a claim to a liberal maintenance at the hands of the congregation. The author of the *Διάδεξι* even compares them to the High Priests of the Old Testament, and considers them entitled to the first-fruits of the Levitical law. In reality, they might justly be compared to the priests in so far as they were the mouthpieces of the congregation in public thanksgiving. (6) Since prophets were regarded as a gift of God and as moved by the Holy Spirit, the individual congregation had no right of control over them. When anyone was approved as a prophet and exhibited the “conversation of the Lord,” no one was permitted to put him down or to criticize him. The author of the *Διάδεξι* goes so far as to assert that whoever does this is guilty of the sin against the Holy Ghost. (7) This unique position of the prophets could only be maintained so long as the original enthusiasm remained fresh and vigorous. From three quarters primitive Christian prophecy was exposed to danger—first, from the permanent officials of the congregation, who, in the interests of order, peace and security could not but look with suspicion on the activity of excited prophets; second, from the prophets themselves, in so
far as an increasing number of dishonest characters was found amongst them, whose object was to levy contributions on the churches; third, from those prophets who were filled with the stern spirit of primitive Christianity and imposed on churches, now becoming assimilated to the world, obligations which these were neither able nor willing to fulfil. It is from this point of view that we must seek to understand the so-called Montanistic crisis. Even the author of the Δαιμόνια finds it necessary to defend the prophets who practised celibacy and strict asceticism against the depreciatory criticism of church members. In Asia Minor there was already in the year 160 a party, called by Epiphanius "Alogi," who rejected all Christian prophecy. On the other hand, it was also in Asia Minor that there appeared along with Montanus those energetic prophets who charged the churches and their bishops and deacons with becoming secularized, and endeavored to prevent Christianity from being naturalized in the world, and to bring the churches once more under the exclusive guidance of the Spirit and His charismata. The critical situation thus arising spread in the course of a few decades over most of the provincial churches. The necessity of resisting the inexorable demands of the prophets led to the introduction of new rules for distinguishing true and false prophets. No prophet, it was declared, could speak in ecstasy, that was devilish; further, only false prophets accepted gifts. Both canons were innovations, designed to strike a fatal blow at prophecy and the church organization re-established by the prophets in Asia—the bishops not being quite prepared to declare boldly that the Church had no further need of prophets. But the prophets would not have been suppressed by their new methods of judging them alone. A much more important circumstance was the rise of a new theory, according to which all divine revelations were summed up in the apocalypses or in their writings. It was now taught that prophecy in general was a peculiarity of the Old Testament ("lex et prophetae usque ad Iohannem"); that in the new covenant God had spoken only through apostles; that the whole word of God so far as binding on the Church was contained in the apostolic record—the New Testament; and that, consequently, the Church neither required nor could acknowledge new revelations, or even instructions, through prophets. The revolution which this theory gradually brought about is shown in the transformation of the religious, enthusiastic organization of the Church into a legal and political constitution. A great many things had to be sacrificed to this, and amongst others to the prophets. The strictly enforced episcopal constitution, the creation of a clerical order, the formation of the New Testament canon accomplished the overthrow of the prophets. Instead of the old formula, "God continually confers on the church apostles, prophets, and teachers," the word now was: "The Church is founded in the (written) word of the prophets (i.e. the Old Testament prophets) and the apostles (viz. the twelve and Paul)." After the beginning of the 3rd century there were still no doubt men under the control of the hierarchy who experienced the prophetic ecstasy, or clerics like Cyprian who professed to have received special directions from God; but prophets by vocation no longer existed and these sporadic utterances were in no sense placed on a level with the contents of the sacred Scriptures.

1 See Lucian's story about Porcgrinus, and that chapter of the Δαιμόνια where the author labours to establish criteria for distinguishing false prophets from true.

PROPYLEA (C₆H₄OH). Two compounds of this formula exist as explained in the article ALCOHOLS. Normal propyl alcohol, CH₃CH₂CH₂OH, was obtained in 1835 by G. C. B. Chancel, by submitting fused oil to fractional distillation. It may be prepared by any of the methods applicable to primary alcohols. It is an agreeable-smelling liquid, boiling at 97.4⁰ C., and miscible with water in all proportions. It cannot be separated from water by fractional distillation, since it forms a mixture of constant boiling point (see DISTILLATION). Oxidation converts it into propionic acid. It is distinguished from ethyl alcohol by its insolubility in a cold saturated calcium chloride solution.

Iso-propyl alcohol (CH₃)₂CHOH, was obtained by M. P. E. Berthelot in 1835 by heating the addition compound of propylene and sulphuric acid with water, and in 1862 by C. Friedel by the reduction of acetone. It is a colourless liquid boiling at 82.7⁰ C.

PROROGATION, a postponement, specifically the termination without dissolution of a session of parliament by discontinuing the meetings until the next session. The Lat. prorogatio (from prorogare, to ask publicly) meant a prolongation or continuance of office or command, cf. prorogatio imperii (Liv. viii. 26), or a

Putting off or deferring of an appointed time, cf. dies ad solvendum prorogare (Cic. Phil. ii. 10, 24). A prorogation of parliament affects both houses, and thus differs from an "adjournment," which does not terminate the session and is effected by each house separately by resolution. Further, at a prorogation, a bill which has not passed all of its stages must begin again ab initio in the next session, and all proceedings, except impeachments and appeals before the House of Lords, are quashed. A prorogation is effected by the sovereign in person, or by commission. If, at the demise of the Crown, parliament stands proroged or adjourned, it is by 6 Anne c. 7 to sit and act at once; similarly the Crown must by proclamation order parliament to sit, if prorogued, when the militia is embodied or the reserves are called out.

PROSEREN (Gr. προσκήνων), that part of the stage in the ancient Greek theatre which lies in front of the σκηνή, scena, the back wall; the word appears to embrace the whole stage between the θρησκευτής and the σκηνή. In the modern theatre the word is applied to that part of the stage which is in front of the curtain and the orchestra, and sometimes to the whole front of the stage, including the curtain and the arch containing it, which separates the stage from the auditorium.

PROSE, a word supposed to be derived from the Lat. prosus, direct or straight, and signifying the plain speech of mankind, when written, or rhetorically composed, without reference to the rules of verse. It has been usual to distinguish prose very definitely from poetry (q.v.), and this was an early opinion. Ronsard said that his training as a poet had proved to him that prose and poetry were "mortal enemies." But "poetry" is a more or less metaphysical term, which cannot be used without danger as a distinctive one in this sense. For instance, an ill-inspired work in rhyme, or even a well-written metrical composition of a satirical or didactic kind, cannot be said to be poetry, and yet most certainly is not prose; it is a specimen of verse.

On the other hand, a work of highly wrought and elaborately sustained non-metrical writing is often called a prose poem. The fact that this phrase may be employed shows that the antithesis between prose and poetry is not complete, for no one, even in jest or hyperbole, speaks of a prose-verse.

Prose, therefore, is most safely defined as comprising all forms of careful literary expression which are not metrically versified, and hence the definition from prosus, the notion being that all verse is in its nature so far artificial that it is subjected to definite and recognized rules, by which it is diverted out of the perfectly direct modes of speech. Prose, on the other hand, is straight and plain, not an artistic product, but used for stating precisely that which is true in reason or fact. The Latins called prose sermo pedestris, and later oratio soluta, thus showing their consciousness that it was not poetry, which soars on wings, and not verse, which is bound by the rules of prosodical confinement.

Prose, however, is not everything that is loosely said. It has its rules and requirements. In the earliest ages, no doubt, conversation did not exist. The rudest fragments of speech were sufficient to indicate the needs of the savage, and these blunt babblings were not prose. Later on some orator, dowered with a native persuasive, and desirous of making an effect upon his comrades, would link together some broken sentences, and in his heat produce with them something more coherent than a chain of ejaculations. So far as this was lucid and dignified, this would be the beginning of prose. It cannot be too often said that prose is the result of conversation, but it must at the same time be insisted upon that conversation itself is not necessarily, nor often, prose. Prose is not the negation of all laws of speech; it rejects merely those laws which depend upon metre. What the laws are upon which it does depend are not easy to enumerate or define. But this much is plain; as prose depends on the linking of successive sentences, the first requirement of it is that these sentences should be so arranged as to ensure lucidity and directness. In prose, that the meaning should be given is the primal necessity. But as it is found that a dull and clumsy, and especially a monotonous arrangement, of sentences is fatal to the attention of the listener or reader, it is
needful to that plainness should be added various attractions and ornaments. The sentences must be built up in a manner which displays variety and flexibility. It is highly desirable that there should be a harmony, and even a rhythm, in the progress of style, care being always taken that this rhythm and this harmony are not those of verse, or recognizably metrical. Again, the colour and form of adjectives, and their sufficient yet not excessive recurrence, is an important factor in the construction of prose. The omission of certain faults, too, is essential. In every language grammatical correctness is obligatory. Here we see a distinction between mere conversation, which is loose, fragmentary and often, even in the lips of highly educated persons, slightly ungrammatical; and prose, which is bound to weed away whatever is slovenly and incorrect, and to watch very closely lest merely colloquial expressions, which cannot be defended, should slip into careful speech. What is required in good prose is a moderate and reasonable elevation without bombast or bathos. Not everything that is loosely said or vaguely thought is prose, and the celebrated phrase of M. Jourdain in Mollière's Bourgeois gentilhomme: "Par moi foi, il y a peut-être quelques phrases et quelques expressions qui je n'ose pas dire...", is not exactly true, although it is an amusing illustration of the truth, for all the little loose phrases which M. Jourdain had used in his life, though they were certainly not verse, were not prose either, whatever the schoolmaster might say. On the other hand, it seems that Earle goes too enthusiastically in the contrary direction when he says, "Poetry, which is the organ of Imagination, is futile without the support of Reason; Prose, which is the organ of Reason, has no vivacity or beauty or artistic value but with the favour and sympathy of the Imagination." It is better to hold to the simpler view that prose is literary expression not subject to any species of metrical law.

**Greece.**—The beginnings of ancient Greek prose are very obscure. It is highly probable that they took the form of inscriptions in temples and upon monuments, and gradually developed into historical and topographical records, preserving local memories, and giving form to local legends. It seems that it was in Ionia that the art of prose was first cultivated, and a history of Miletus, composed by the half-mythical Cadmus, is appealed to as the earliest monument of Greek prose. This, however, is lost, and so are all the other korai of earliest times. We come down to something definite when we reach Hecataeus, the first geographer, and Herodorus, the first natural philosopher, of the Greeks; and, although the writings of these men have disappeared, we know enough about them to see that by the 4th century B.C. the use of prose in its set modern sense had been established on a permanent basis. We even know what the character of the style of Hecataeus was, and that it was admired for its clearness, its grammatical purity, its agreeable individuality—qualities which have been valued in prose ever since. These writers were promptly succeeded by Hellanicus of Lesbos, who wrote many historical books which are lost, and by Herodotus of Halicarnassus, whose noble storehouse of chronicle and legend is the earliest monument of European prose which has come down to us. When once non-metrical language could be used with the mastery and freedom of Herodotus, it was plain that all departments of human knowledge were open to its exercise. But it is still in Ionia and the Asiatic islands that we find it cultivated by philosophers, critics and men of science. The earliest of these great masters of prose survive, not in their works, but in much later records of their opinions; in philosophy the actual writings of Thales, Anaximander, Pythagoras and Empedocles are lost, and it is more than possible that their cosmological rhapsodies were partly metrical, a mincing of ode with prose apostrophem. We come into clearer air when we cross the Aegean and reach the Athenian historians: Thucydides, whose priceless story of the Peloponnesian War has most fortunately come down to us; and Xenophon, who continued that chronicle in the spirit and under the influence of Thucydides, and who carried Greek prose to a great height of easy distinction. But it is with the practice of philosophy that prose in ancient Greece rises to its acme of ingenuity, flexibility and variety, proving itself a vehicle for the finest human thought such as no later ingenuity of language has contrived to excel. The death of Socrates (399 B.C.) has been taken by scholars as the date when the philosophical writings of the Athenians reached their highest pitch of perfection in the art of Plato, who is the greatest prose writer of Greece, and, in the view of many who are well qualified to judge, of the world. In his celebrated dialogues—Crito, Gorgias, Phaedo, Phaedrus, the Symposium, most of all perhaps in the Republic—we see what splendour, what elasticity, what exactitude, this means of expression had in so short a time developed; how little there was for future prose-writers in any age to learn about their business. The rhetoricians were even more highly admired by the critics of antiquity than the philosophers, and it is probable that ancient opinion would have set Demosthenes higher than Plato as a composer of prose. But modern readers are no longer so much interested in the technique of rhetoric, and, although no less an authority than Professor Gilbert Murray has declared the essay-writing of the school of Isocrates to form "the final perfection of ancient prose," the works of the orators cease to move us with great enthusiasm. In every age we see the conscious art of prose writing subordinated to the preservation and explanation of facts, and after Aristotle's day there is little to record in a hasty outline of the progress of Greek prose.

**Latin.**—In spite of having the experience of the Greeks to guide them, the Romans obeyed the universal law of literary history by cultivating verse long before they essayed the writing of prose. But that the example of later Greece was closely followed in Rome is proved by the fact that the earliest prose historians of whom we have definite knowledge, Q. F. Pictor and C. C. Alimentus, actually wrote in Greek. The earliest anastil who wrote in Latin was L. C. Hemina; the works of all these early historians are lost. A great deal of primitive Roman prose was occupied with jurisprudence and political oratory. By universal consent the first master of Latin prose was Cato, the loss of whose speeches and "Origines" is extremely to be deplored; we possess from his pen one practical treatise on agriculture. In the next generation we are told that the literary perfection of oratory was carried to the highest point by Marcus Antonius and Lucius Licinius Crassus—"by a happy chance their styles were exactly complementary to one another, and to hear both in one day was the highest intellectual entertainment which Rome afforded." Unfortunately none but inconsiderable fragments survive to display to us the qualities of Roman prose in its golden age. Happily, however, those qualities were concentrated in a man of the highest genius, whose best writings have come down to us; this is Cicero, whose prose exhibits the Latin language to no less advantage than Plato's does the Greek. From 70 to 60 B.C. Cicero's literary work lay mainly in the field of rhetoric; after his exile the splendour of his oratory declined, but he was occupied upon two treatises of extreme importance, the De oratore and the De republica, composed in 55 and 54-57 B.C. respectively; of the latter certain magnificent passages have been preserved. The beautiful essays of Cicero's old age are more completely known to us, and they comprise two of the masterpieces of the prose of the world, the De amicitia and De senectute (45 B.C.). It is to the collection of the wonderful private letters of Cicero published some years after his death by Atticus and Tiro, that we owe our intimate knowledge of the age in which he lived, and these have ever since and in every language been held the models of epistolary prose. Of Cicero's greatest contemporary, Julius Caesar, much less has been preserved, and this is unfortunate because Roman critical opinion placed Caesar at the head of those who wrote Latin prose with purity and perfection: His letters, his grammars, his works of science, his speeches are lost, but we retain his famous *Commentaries on the War in Gaul*. Sallust followed Caesar as an historian, and Thucydides as a master of style. His use of prose, as we trace it in the Jugurtha and the Catilina, is hard, clear and polished. The chroniclers who succeeded Sallust neglected these qualities, and Latin prose, as the Augustan age began, became more diffuse and more rhetorical.
PROSE

But it was wielded in that age by one writer of the highest genius, the historian Titus Livius. He greatly enriched the tissue of Latin prose with ornament which hitherto had been confined to poetry; this enables him, in the course of his vast annals, "to advance without flagging through the long and intricate narrative where a simpler diction must necessarily have grown monotonous" (Mackail). The periodic structure of Latin prose, which had been developed by Cicero, was carried by Livy "to an even greater complexity." The style of Pollio, who wrote a History of the Civil Wars, was much admired, and the loss of this work must be deplored. A different species of prose, the plebius sermo, or colloquial speech of the poor, is partly preserved in the invaluable fragments of a Neronian writer, Petronius Arbiter. Of the Latin prose-writers of the silver age, the elder Pliny, Quintilian and Tacitus, who adorned the last years before the decay of classical Latin, nothing need here be said.

English.—It was long supposed that the conscious use of prose in the English language was a comparatively recent thing, dating back at farthest to the middle of the 16th century, and due directly to French influences. Earle was the first to show that this is not the case, and the assertion that we have a longer pedigree of prose literature than any other country in Europe." Though this may be held to be a somewhat violent statement, the independence of English prose is a fact which rests on a firm basis. "The Code of Laws of King's Inn" dates from the 7th century, and there are various other legal documents which may be hardly literature in themselves, but which are worded in a way that seems to denote the existence of a literary tradition. After the Danish invasion, Latin ceased to be the universal language of the educated, and translations into the vernacular began to be required. In 887, Alfred, who had collected the principal scholars of England around him, wrote with their help, in English, his Hand-Book; this, probably the earliest specimen of finished English prose, is unhappily lost. Alfred's preface to the English version of the Cura pastoralis was in Latin; this translation was probably completed in 890. Later still Alfred produced various translations from Bede, Orosius, Boethius and other classics of the Latin literature, and, in 900, closing a translation from St Augustine, we read "Here end the Latin, and begin the English." The style is straightforward and clear, without any pretension to elegance. He had no direct followers until the time of the monastic revival, and the monastic revival, the name of eminence which we encounter is that of Ælfric, who, about 997, began to translate, or rather to paraphrase, certain portions of the Bible. The prose of Ælfric, however, though extremely interesting historically, has the fault that it presents too close a resemblance, in style and movement, to the alliterative verse of the age. This is particularly true of his Homilies. A little later vigorous prose was put forth by Wulfstan, archbishop of York, who died in 1023. At the Norman Conquest, the progress of English prose was violently checked, and, as has been acutely said, it "was just kept alive, but only like a man in catalysis." The Annals of Winchester, Worcester and Peterborough were carried on in English until 1134, when they were resumed in Latin; the chronicle which thus came to an end was the most important document in English prose written before the Norman Conquest. Except in a few remote monasteries, English now ceased to be used, even for clerical purposes, and the literature became exclusively Latin or French. There was nothing in prose that was analogous to the revival of verse in the Ormulum or the metrical chronicles. All the pre-Norman practice in prose belongs to what used to be distinguished as Anglo-Saxon literature. The distinction has fallen into desuetude, as it has become more clearly perceived that there is no real break between the earlier and the later language. The Norman check, however, makes it fair to say that modern English prose begins with the Testament of Love of Thomas Usk, an imitation of the De consolatione of Boethius, which a certain London Lollard wrote in prison about 1354. About the same time were written a number of translations, The Tale of Melibe and The Parson's Sermon by Chaucer; the treatises of John of Trevisa, whose style in the Polychronicon has a good deal of vigour; and the three versions of the Tracts of Jean d'Arbe, formerly attributed to a fabulous "Sir John Mandeville." The composite text of these last-mentioned versions really forms the earliest specimen of purely secular prose which can be said to possess genuine literary value, but again the fact, which has only lately been ascertained, that "Sir John Mandeville" was not an original English writer robs it of much of its value. The anonymous compiler-translator can no longer be styled "the father of English prose." That name seems more properly to belong to John Wyclif, who, in the course of his fierce career as a controversialist, more and more completely abandoned Latin for English as the vehicle of his tracts. The earliest English Bible was begun by Nicholas Hereford, who had carried it up to Baruch, when he abruptly dropped it in June 1382. The completion of this great work is usually attributed, but on insufficient grounds, to Wyclif himself. A new version was almost immediately started by John Purvey, another Wyclifite, who completed it in 1388. We are still among translators, but towards the middle of the 14th century Englishmen began, somewhat timidly, to use prose as the vehicle for original work. Caxton, an Augustinian friar, will be a chronicler of English prose, the history down to 1417; Sir John Fortescue, the eminent constitutional jurist, produced about 1457 a book on The Governance of England; and Reginold Pecock, bishop of Chichester, attacked the Lollards in his Repressor of Over Much Blaming of the Clergy (1455), which was so caustic and scandalous that it cost him his diocese. The prose of Pecock is sometimes strangely modern, and to judge what the ordinary English prose familiarly in use in the 15th century was it is more useful to turn to The Paston Letters. The introduction of printing into England is coeval with a sudden development of English prose, a marvellous example of which is to be seen in Caxton's 1485 edition of Sir Thomas Malory's Mort d'Arthur, a compilation from French sources, in which the capacities of the English language for melody and noble sweetness were for the first time displayed, although much was yet lacking in strength and conciseness. Caxton himself, Lord Berners and Lord Rivers, added an element of literary merit to their useful translations. The earliest modern historian was Robert Fabian, whose posthumous Chronicles were written in the beginning of the 16th century, while the most influential of the Noble Families of Lancaster and York had the honour of being studied by Shakespeare. With the advance of the Renaissance to England, prose was heightened and made more colloquial. Sir Thomas More's Richard III. was a work of considerable importance; his finer Utopia (1516) was unfortunately composed in Latin, which still held its own as a dangerous rival to the vernacular in prose. In his Governor (1534) Sir Thomas Elyot added moral philosophy to the gradually widening range of subjects which were thought proper for English prose. In the same year Tyndale began his famous version of the Bible, the story of which forms one of the most romantic episodes in the chronicles of literature; at Tyndale's death in 1536 the work was taken up by Miles Coverdale. The Sermons of Latimer (1540) introduced elements of humour, dash and vigour which had before been foreign to the stately but sluggish prose of England. The earliest biography, a book in many ways marvellously modern, was the Life of Cardinal Wolsey, by George Cavendish, written about 1557, but not printed (even in part) until 1641. In the closing scenes of this memorable book, which describe what Cavendish had personally experienced, we may say that the perfection of easy English style is reached for the first time. The prose of the middle of the 16th century—as we see it exemplified in the earliest English critic, Sir Thomas Wilson; the earliest English pedagogue, Roger Ascham; the distinguished humanist, Sir John Cheke—is clear, unadorned and firm, these Englishmen holding themselves bound to resist the influences coming to them from Italy and Spain, influences which were in favour of elaborate verbiage and tortured construction. Equal simplicity marked such writers as Foxe, Stow and Holinshed, who had definite information to purvey, and wished a straightforward prose in which to present it. But Hoby and North, who
translated Guevara, Castiglione and Amyot, brought with them not a few of the ingenious erotic graces of those originals, and prepared the way for the startling innovations of Lyly in his famous didactic romance of Euphues (1579). The extravagances and eccentricities of Lyly outdid those of his continental prototypes, and euphuisms became a disturbing influence which, it may be, English prose has not, even to the present hour, entirely succeeded in throwing off. In spite of its overwhelming popularity, it was opposed in its own day, not merely by the stately sobriety of Hooker, in whom we see Latin models predominant, but by the sweetness of Sir Philip Sidney in his Arcadia. Raleigh wrote English prose that was perhaps more majestic than any which preceded it, but he revelled in length of sentence and in ponderosity of phrase, so that it is probable that the vast prestige of The History of the World on the whole delayed the emancipation of English prose more than it furthered it. The direct influence of the euphuistic eccentricity was seen for some time in the work of poets like Lodge and Greene, and divines like Lancelot Andrews; its indirect influence in the floweriness and violence of most careful prose down to the Restoration. Bacon, whose contempt of the vernacular is with difficulty to be excused, despairs too early of our national writing. Donne cultivated a rolling and sonorous majesty of style; and Burton could use English with humour and vivacity when he gave himself the chance, but his text is a prototype of the vicious abuse of quotation which was a crowning fault of prose in the early 17th century. In spite of the skill with which, during the civil wars and the Commonwealth, certain authors (such as Jeremy Taylor, Howell, Fuller, Milton, Izaak Walton) manipulated prose, and in spite of the extraordinary magnificence of the Ciceronian periods of Sir Thomas Browne, it was not until shortly before the Restoration that English prose reached its perfection. According to Dr Johnson, Sir William Temple (1629-1699) "was the first writer who gave cadence to English prose, and did not run into the variety which is the bane of cultivated persons. This may be called the foundation of modern English prose, which has extended into no departments not recognized, at least in essence, by Bunyan, Dryden and Temple. The ensuing varieties of prose have been mainly matters of style. In the 18th century, for instance, there was a constant alternation between a quiet, rather cold elegance and precision of prose-writing, which was called the Addisonian manner, and a swelling, latinitized style, full of large words and heavy periods, in which Johnson was the most famous but Gibbon perhaps the most characteristic proficient. But as far as grammatical arrangement and the rules of syntax are concerned, it cannot be said that English prose has altered essentially since about 1680. It is, however, to be noted that in the course of the 19th century the use of short sentences, and the habit of neglecting to group them into paragraphs, introduced a heresy not known before; and that, on the other hand, there has been a successful attempt made to restore the beauty and variety of early 17th-century diction, which had suffered a long decline from the Restoration onwards.

Icelandic.—The independent invention of prose by the exiled aristocrats in the Heroic Age of Iceland is one of the most singular facts in literary history. It resulted from the fact that story-telling grew to be a recognized form of amusement in the isolated and refined life of an Icelandic household from the 9th to the 11th century. Something of the same kind had existed in the courts of Norway before the exodus, but it was in Iceland that it was reduced to an art and reached perfection. It is remarkable how suddenly the saga, as a composition, became a finished work; it was written in a prose which immediately presented, in the best examples, "a considerable choice of words, a richness of alliteration and a delicate use of syntax" (Vigfusson). The deliberate composition of sagas began about the year 1050, and it is supposed that they began to be written down soon after 1100. It is distinctly recorded that Arí Fröði (1067-1148) was the first man in Iceland who wrote down stories in the Norse tongue. Many of Arí's books are lost, but enough survive to show what Icelandic prose was in the hands of its earliest artificer, and the impress of his rich and simple style is felt on all the succeeding masterpieces of the great age of Icelandic history and biography. But the Greater Sagas, as they are called, the anonymous stories which followed the work of Arí and were completed in the 13th century, exhibit prose style in its most enchanting fullness, whether in the majesty of Ínjal, in the romantic art of Laxálo, or in the hurrying garrulity of Eyrbýggja. There followed a vast abundance of sagas and sagawriters. The great historian, Sturla (1214-1284), is the latest of these classic writers of Iceland, and after his death there was a very rapid decline in the purity and dignity of the national prose. By the opening of the 14th century the art of writing in the old noble language had become entirely lost, and it was not until the 17th century that it began to revive as an archaeological curiosity and a plaything for scholars. "For an Icelander of the present day to write modern history in saga style is a ludicrous absurdity," and the splendid living prose of the 12th century remains unrelated, a strange and unparalleled portent in the history of European literature. Of its beneficial effect on later Scandinavian, English and even Germanic style there can be no question.

Spain.—In Castilian Spanish, as in the other languages of Europe, verse is already far advanced before we meet with any distinct traces of prose. A didactic treatise for use in the confessional is attributed to a monk of Navarre, writing in the 13th century. Between 1220 and 1250 a chronicle of Toledo was indited. But the earliest prose-writer of whom Spain can really boast is King Alphonso the Learned (1226-1284), in whose encyclopaedic treatises "Castilian makes its first great stride in the direction of exactitude and clearness" (Fitzmaurice-Kelly). Almost all the creditable prose of the end of the 13th century is attributed to Alphonso, who was helped by a sort of committee of subsidiary authors. The king's nephew, Juan Manuel (1282-1347), author of the admirable Conde Lucanor, carried prose to a further point in delicacy and precision. The poet Ayala (1332-1407) was another gifted artificer of Spanish prose, which suffered a setback in the hands of his successors, Santillana and Mena. It rose once more in The Sea of Histories of Pérez de Guzmán (1378–1460), who has been compared to Plutarch and St Simon, and in whom the lucid and energetic purity of Castilian prose is for the first time seen in its perfection. In the 15th century the shapeless novel of chivalry was predominant, while in the age of Charles V. poetry altogether overshadowed prose. The next great writer of prose whom we meet with is Guevara, who died in 1545, and whose Dial of Princes exercised an influence which was not confined to Spanish, and even extended to English prose (in North's well-known version). The historians of this period, prolix and discursive, were of less value. The earliest picaroon novel, Lazarillo de Tormes (1554), the authorship of which is unknown, introduced a new form and exhibited Castilian prose style in a much lighter aspect than it had hitherto worn. Still greater elegance is met with in the mystical and critical writings of Juan de Valdés and in those of Luis de León; of the latter Mr Fitzmaurice-Kelly says that "his concise eloquence and his classical purity of expression rank
him among the best masters of Castilian prose." The instrument, accordingly, was polished and sharpened for the finest uses, and was ready to the hand of the supreme magician Cervantes, whose Don Quixote was begun a few years (about 1501) after Los Nombres de Cristo of Luís de León had been published (1583); these dates are significant in the history of Spanish prose. The prose of Lope de Vega is stately and clear, but of course has little importance in comparison with the verse of his huge theatre. Quevedo's style had the faults which were now invading all European writing, of violent antithesis and obscure ingenuity; but his Visiones (1627) occupy a prominent place in the history of Castilian prose. The latest struggles of a decadent critical conscience, battling against tortuousness and affectation, are seen in Gracián (1601-1658) and in Molinos (1627-1697), who vainly endeavoured to save classic prose out of the intellectual shipwreck of the 18th century. When Spanish prose revived in the 19th century, in the person of Larra (1800-1837), the influence of French models was found to have deprived it of distinctly national character, while giving it a fresh fluidity and grace.

French.—There had long been a flourishing versified literature in the vernacular of France, before anyone thought of writing French prose. It was the desire to be exact in giving information, together with a reduced sense of the value of rhyme and rhythm, which led to a partial divergence from metre. The translator of the fabulous Chronicle of Turpin mentions that he writes in prose "because rhyme entails the addition of words which are not in the Latin." Thus about the year 1200 verse began to be abandoned by chroniclers who had some definite statements to impart, and who had no natural gifts as poets. They ceased to sing; they wrote, more or less easily, as those around them spoke. The earliest French prose was translated from the Latin, but Baldwin VI, who died in 1205, is said to have commissioned several scribes to compile in the vulgar tongue a history of the world. If this was ever written it is lost, but we possess a Book of Stories written about 1225 by a clerk at Lille, which may fairly be said to be the start-word of French prose history. When once, however, a taste for prose was admitted, the superiority of that medium over verse as material for exact history could not but be perceived, and prose soon became frequent. The earliest French prose-writer of genius was Geoffroy (or Jofroi) de Villehardouin, who put down memoirs of his life between 1198 and 1207; he left his book, which is known as The Conquest of Constantinople, incomplete when he died in 1213. In the history of prose, Villehardouin takes an eminent place. In his admirable style are seen many of the most precious elements of French prose, its lucidity, its force, its sobriety and its charm of address. He had been trained as an orator, and it was his merit that, as M. Langlois has said, he was content to write as he had learned to speak. Villehardouin was closely followed by other admirable writers of memoirs, by Robert of Clari, by Henri of Valenciennes, by the anonymous chronicler of Béthune, to whom we owe the famous description of the battle of Bouvines, and by the Minstrel of Reims. The last-named finished his Récits in 1260. These works in the new easy manner of writing were found to be as elegant and as vivacious as any preserved by the old rhetorical art of verse. They led the way directly to the eminent writer who was the earliest historian of modern Europe, to Jean de Joinville, who finished his Histoire de St Louis in 1309. A century later Froissart left his famous Chroniques unfinished in 1404, and again a hundred years passed before Philippe de Comines supplied the thread of his Mémoires in 1511. These are the three most illustrious names in the chronicle of French medieval prose, in whom the various characteristics of the nation are separately developed. It must be noted that these three are simply the most eminent figures in a great cloud of prose-writers, who preserved with more or less vivacity the features of French life in the later middle ages, and helped to facilitate the use of the central national language. In the 15th century, moreover, Antoine de la Salle deserves mention as practically the earliest of French novelists, and one whose skill in the manipulation of language was long in waiting for a rival among his successors. But with the Renaissance came the infusion into France of the spirit of antiquity, and in Rabelais there was revealed an author of the very highest genius who at once defended the integrity of French syntax and enriched its vocabulary with an infinite multitude of forms. The year 1532, in which the first brief sketch of Gargantua appeared, was critical in French literature; for more than twenty years afterwards the structure of the great Pantagruelistic romance was still being built. Meanwhile in 1549 had appeared the Défense et illustration de la langue française of Joachim du Bellay, in which the foundations of the learned and brilliant literary criticism of France were firmly laid. The liberation of the language proceeded simultaneously in all directions. In 1539 it was officially decreed that all judicial acts were henceforth to be written in vernacular prose, "en langage maternal français et non autrement." Calvin led the theologians, and his precise, transparent and sober prose, curiously deficient in colour, gave the model to a long line of sober rhetoricians. It is in the pages of Calvin that we meet for the first time with a simple French prose style, which is easily intelligible by the reader of to-day. There is some affectation of an ornamented pedantry in St François de Sales, some return to the form and spirit of medieval French in Montaigne; so that the prose of these great writers may easily seem to us more antiquated than that of Calvin. Yet the Institution belongs at latest to 1560, and the immortal Essais at earliest to 1580. We are approaching the moment when there should be nothing left for French prose to learn, and when development should merely take forms of personal brilliancy and initiative of enterprise on lines already clearly laid down. But we pause at Rabelais, in whom the broad practice of French as Froissart and the medieval chroniclers had used it was combined with the modern passion for minute detail and the close observation of the picturesque. Here the habit of memoir-writing in French prose first becomes a passion. With the beginning of the 17th century there sprang up almost an infatuation for making prose uniformly dignified and noble, for draping it in solemn robes, for avoiding all turns of speech which could remind the reader of the "barbarous" origins of the language; the earliest examples of this subjection of eloquence to purely aristocratic forms have been traced back to the Servitude volontaire of Montaigne's friend, La Boëtie (1530-1563). In the pursuit of this dignity of speech the prose writers of the 16th century ventured to borrow not words merely but grammatical terms and peculiarities of syntax from the ancient literatures of Greece and Rome. The genius of France, however, and the necessity of remaining intelligible checked excess in this tendency, and after a few wild experiments the general result was discovered to be the widening of the capacities of the language, but at the temporary expense of some of the idiomatic richness of the old French form. In the 17th century a great stimulus was given to easy prose by the writers of romances, led by d'Urfé, and by the writers of letters, led by Balzac. In the hands of these authors French prose lost its heaviness and its solemnity; it became an instrument fit to record the sentiments of social life in an elegant balance of phrases; here was first discovered what Voltaire calls the nombre et harmonie de la prose. French style became capable of more than this, it achieved the noblest and the subtlest expressions of human and divine philosophy, when it was used by Descartes and by Pascal to interpret their majestic thoughts to the world. At this moment of national development, in 1617, the French Academy was founded, for the distinct purpose of purifying, embellishing and enlarging the French language; and in process of time, out of the midst of the academy, and as a primary result of its labours, arose the extremely important Remarques (1647) of Vaugelas, a work of grave authority, which was the earliest elaborate treatise on the science of prose in any language. Antiquated as the method of Vaugelas now seems, and little regarded in detail by modern writers, it may be said that his famous book is still the basis of all authority on the subject of French prose. In common with his colleagues of the hour, Vaugelas strove to lay down laws by which harmony of structure,
a graceful sobriety, lucidity and exactitude of expression, could be secured to every practised French writer. He was not accepted as an infallible lawyer, even in his own age; he was immediately exposed to the searching criticism of La Mothe le Vayer, who, however, was radically at one with him regarding the basis of his definition. The great demerit of the early academicians was that they knew little and cared less about the forms of medieval French. They thrust everything aside which they regarded as barbarous, and the work of the 10th century was to recover from a past behind Rabelais elements of great value which the 17th had arbitrarily rejected as "incorrect." In the succeeding centuries there has been a vast extension of the practice of French prose into every conceivable department of experience and observation, but in spite of all neologisms, and in spite of the waves of preciosity which have periodically swept over the French language in the three hundred years which divide the age of Somaize from that of Maillarmé, the treatise of Vaugelas remains the final code in which the laws that govern French prose are preserved.

Italy.—The case of prose in the Italian language has this unique feature that, instead of gathering form obscurely and slowly, it came into sudden existence at the will of one of the greatest of writers. Latin had almost universally been used in Italy until the close of the 13th century, when Dante created a vernacular prose in the non-metrical part of his famous Vida Nuova, written about 1293. For a long time the prose of Dante stood practically alone, and Petrarch actually affected to despise the works which his great predecessor had written in the vulgar tongue. But about 1348 Boccaccio started the composition of his Decameron, which gave classic form to the prose romance of Italy. There had been stories in the vernacular before, and Boccaccio himself had written the Filopeco and the Amato, but the Decameron marked the lines upon which easy and graceful Italian prose was to move for the future. It should have been greatly to the advantage of Italy over the other countries of Europe, that in the hands of Dante and Boccaccio prose was born full-grown, and had not to pass through the tedious periods of uncertain development which awaited it in England, France, and Spain. After this brilliant beginning, however, there was a decline in the 15th century, the writers of the next age lacking the courage to be independent of antiquity. There was a return to Latin phraseology which made many works almost masonic in character; the famous Hyperoaiomachia of Colonna is an instance of this. Something of the purity of Italian prose as Boccaccio had left it was recovered by Sannazaro in his Arcadia (1489) a pseudo-classical pastoral romance, the form of which was widely imitated throughout Europe; even Sannazaro, however, did not see how needful it was to cast off Latin constructions. At length a pair of historians, Machiavelli and Guicciardini, succeeded in releasing prose from the yoke of Rome, and in writing undiluted Tuscan. In the 16th century the prose writers of Italy became extremely prolific, with Pietro Bembo at their head. The novelists were now prominent, but, although they take a foremost place in the history of Italian literature, there was little art in their employment of language. Many of the first novelists were born out of the Latin form, like Bandello, who learned the exact rules of pure Italian prose. Since the 16th century Italian would seem to have undergone no radical changes as a language, and its prose has been stationary in form. At the close of the 19th century a new school of writers, with Gabriele d'Annunzio at its head, created a demand for a new prose, but it is significant that the remedy suggested by these innovators was neither more nor less than a return to the procedure of Boccaccio and Machiavelli, who remain the types of ease and dignity in Italian prose.

German.—The earliest coherent attempts at the creation of German prose belong to the age of Charlemagne, and the first example usually quoted is the Straßburger Eidschrifte of 842. For all literary purposes, however, metrical language was used exclusively during the mittelhochdeutsch period, which lasted until the end of the 13th century. What little prose there was, was limited to jurisprudence and theology. David of Augsburg, who died in 1272, is named as the earliest preacher in the vernacular, but only one of his sermons has come down to us. More important was Berthold "the Sweet" (1220-1272), whose sermons were discovered by Neander and published in 1824. Historical prose began with the Saxon Chronicle of 1248. There was little to record in the next two centuries, until prose was revived by Geiler von Kaisersburg (1445-1510) in his sermons. About the same time translations were made of the Decameron and of other Italian collections of novels. The development of prose in Germany is, however, negligible until we reach the Ref ormation, and it is Luther's Bible (New Testament, 1522), on which all classic German prose is based. This movement is due to Luther alone, since the other protagonists of reform wrote mainly in Latin. Johann Fischart composed important secular books in the vernacular, in particular the Bienenkorb (1570) and an imitation of Gargantua (1575), which is the earliest German novel. But nearly a century passes before we reach another prose work of real importance in the German vernacular, this being the curious piaraeose romance of Simplicissimus (1664) of Grimmelshausen. But the neglect of prose by the German nation was still general, and is exemplified in the way by which men of the stamp of Leibnitz wrote in Latin and even in French, rather than in their own "barbarous" tongue. What Luther had done at the beginning of the 16th century was, however, completed and confirmed in the middle of the 18th by Lessing, who must be considered as the creator of modern German prose. The critical period in this revival was 1764 to 1768, which saw the production of Laocoön and the Hamburgische Dramaturgie. We pass on presently to Jean Paul Richter, and so to Goethe, in whose majestic hands German prose became the organ of thought and eloquence which it has been ever since.

PROSECUTION, the procedure by which the law is put in motion to bring an accused person to trial (see CRIMINAL LAW; INDICTMENT; SUMMARY JURISDICTION, and TRIAL). In theory in the United Kingdom the king is in all criminal offences the prosecutor, because such offences are said to be against his person, and either person or dignity, but in practice such prosecutions are ordinarily undertaken by the individuals who have suffered from the crime. This is a different procedure from that prevailing in Scotland, European continental countries and the United States, in all of which a public department or officer undertakes the prosecution of offences. A step towards public prosecution was taken in England by the Prosecution of Offences Act (1879), under which an officer called the "Director of Public Prosecutions" was appointed; in 1884 the Prosecution of Offences Act of that year revoked the appointment made under the act of 1879, and constituted the solicitor to the Treasury Director of Public Prosecutions. The Prosecution of Offences Act (1908) separated the two offices again, making the public prosecutor independent of the treasury, but putting him under the control of the Home Office. The duty of the public prosecutor is to institute, undertake or carry on criminal proceedings in any court and to give advice and assistance to persons concerned in the proceedings. An officer, according to the act of 1908, does not preclude any person from instituting or carrying on criminal proceedings, but the public prosecutor may at any stage undertake the conduct of these proceedings if he thinks fit (s. 2, par. 3).

A person to be qualified for the post of public prosecutor must be a barrister or solicitor of not less than ten years' standing, and an assistant public prosecutor, who may be appointed under the act of 1908 and who is empowered to do any act or thing which the public prosecutor is required or authorized to do, must be a barrister or solicitor of not less than seven years' standing. See also LORD ADVOCATE.

PROSELYTE (Gr. προσεληφμων), strictly one that has arrived (eman), a stranger or sojourner, a term now practically restricted to converts from one religion to another.
was originally so used of converts to Judaism, but any one who sets out to convert others to his own opinions is said to "proselytize." The word is commonly used in the Alexandrian Greek translation of the Old Testament (Septuagint) for the Hebrew word (ger) which is derived from a root (ger) denoting to sojourn. The English versions often render the word by "stranger;" but though distinguished from the home-born 'ezrah (=one rising from the soil), the person denominated ger became the equal of the native Israelite, and, when the meaning of ger passed from a mainly civil to a religious connotation, enjoyed many rights. Like the Arabic jar (which is philologically cognate to ger), the ger attached himself as a client to an individual or as a protected settler to the community. He shared in the Sabbath rest (Exod. xx. 10), and was liable to the same duties and privileges as Israel (see references in Oxford Genesis, p. 158). The Hebrew word later came to mean what we now understand by proselyte, a term which appears in the sense of convert to Judaism in the New Testament (Matt. xxii. 15; Acts iv. 20).

The Rabbinic law recognized two classes: (a) the full proselyte, the stranger of righteousness (ger sedeq), who was admitted after circumcision, baptism, and the offering of a sacrifice (after the destruction of the Temple the first two ceremonies were alone possible); and (b) the limited proselyte, the resident alien (ger toshab) or proselyte of the gate (ger ha-ša'ar), who, without accepting Judaism, renounced idolatry and accepted Jewish jurisdiction, thereby acquiring limited citizenship in Palestine. Some authorities think that the "God-fearers" of some of the Psalms and of the New Testament were these limited proselytes. The Hebrew and Greek terms, however, lost the connotation of a change of residence, and both ger and "proselyte" came to apply to a convert without regard to his nationality.

At various periods there were proselytes to Judaism. The Maccabaeans used compulsion in some cases, but Judaism in the Diaspora was a missionary religion in the less militant sense. However, the growth of the kingdom of Israel an escape from the pressure of Jewish Judaism. There were, however, varying opinions as to the value to the Jewish body of these accasions. Some rabbis interpreted Israel's dispersion as divinely designed for the very purpose of proselytization. The process may be likened to that of the Gentile converts which may have been made easy, circumcision being sometimes omitted, but the conditions became gradually more severe, until they reached their present form. It is thought that the Hadranic persecution led to the construction of the walls of Jerusalem, the temple of the women, and the victor in the dedication of the temple, which was intended to be the type of the kingdom of Israel. The city and temple were the type of the kingdom of Israel.

The practice of proselytization has been widely prevalent at different times in different places. In the case of the American Indians, the missionaries were to a large extent dependent upon the aid of the government for the conversion of the Indians. The missionaries were not allowed to use force, only persuasion. The government was required to assist in the work of conversion, and the missionaries were given certain privileges by the government. However, the missionaries were not always successful in their attempts at proselytization. In some cases, the Indians were not willing to convert to the Christian religion. In other cases, the missionaries were not able to reach all of the Indians because of the vastness of the country.

PROSERPINA (Proserpina), the Latin form of Persephone, a Greek goddess, daughter of Zeus and the earth-goddess Demeter. In Greek mythology Demeter and Proserpina were closely associated, being known together as the two goddesses, the venerable or august goddesses, sometimes as the great goddesses. Proserpina herself was commonly known as the daughter (Core), sometimes as the first-born. As she was gathering flowers with her playmates in a meadow, the earth opened and Pluto, god of the dead, appeared and carried her off to be his queen in the world below. This legend was localized in various places, as at Eleusis, Lerna, and "that fair field of Enna" in Sicily. Torch has been said to have been that which was kept sacred to the gods and finding her mother, she freed the earth to put forth its increase. So all that year not a blade of corn grew on the earth, and men would have died of hunger if Zeus had not persuaded Pluto to let Proserpina go. But before he let her go Pluto made her eat the seed of a pomegranate, and thus she could not stay away from him for ever. So it was arranged that she should spend two-thirds (according to later authors, one-half) of every year with her mother and the heavenly gods, and should pass the rest of the year with Pluto beneath the earth. There can be little doubt that this is a mythological expression for the growth of vegetation in spring and its disappearance in autumn. According to Theopompos there was a Western people who actually called the spring Proserpina. As wife of Pluto, she sent spectres, ruled the ghosts, and carried into effect the curses of men. The lake of Avernus, as an entrance to the infernal regions, was sacred to her. From the head of a dying person Proserpine could draw forth the soul, and it was said that which had been kept sacred to the gods and unshorn through life. She was sometimes identified with Hecate. On the other hand in her character of goddess of the spring she was honoured with flower-festivals in Sicily and at Hipponium in Italy. Sicily was a favourite haunt of the two

1. See, however, regard Proserpina as a native Latin form, not borrowed from the Greek, and connected with *prospere*, meaning the goddess who aided the germination of the seed.

2. The story is reminiscent of the old form of marriage by capture.

3. The idea that persons who have made their way to the abode of the dead cannot return to life, as is supposed by modern man, if they have not married and have not borne issue. The fertility of the dead appears elsewhere, as in New Zealand (R. Taylor, New Zealand, pp. 233, 271).

4. Hymn to Demeter; Ovid, Fasti, iv. 419; Metam. v. 385. The ancient custom to cut a lock of hair from a dead man's head, and hang it outside of the house door, in token that there was a corpse in the house. At least this seems a fair inference from Eurip. Alc. 75, 76, 101-104. The lock of hair was the symbol of death, and was to be preserved as a relic of the deceased.

5. Cf. Hymn to Demeter; Ovid, Fasti, iv. 419; Metam. v. 385. The ancient custom to cut a lock of hair from a dead man's head, and hang it outside of the house door, in token that there was a corpse in the house. At least this seems a fair inference from Eurip. Alc. 75, 76, 101-104. The lock of hair was the symbol of death, and was to be preserved as a relic of the deceased. The ancient custom to cut a lock of hair from a dead man's head, and hang it outside of the house door, in token that there was a corpse in the house. At least this seems a fair inference from Eurip. Alc. 75, 76, 101-104. The lock of hair was the symbol of death, and was to be preserved as a relic of the deceased.
PROSKUROV—PROSTITUTION

457

goddesses, and ancient tradition affirmed that the whole island was sacred to them. The Sicilians claimed to be the first on whom Demeter had bestowed the gift of corn, and hence they honoured the two goddesses with many festivals. They celebrated the festival of Demeter when the corn began to shoot, and the descent of Proserpine when it was ripe. At Cyare, a fountain near Syracuse which Pluto made to spring up when he carried off his bride, the Syracusans held an annual festival in the course of which bulls were sacrificed by being drowned in the water. At Cyzicus also, in Asia Minor, bulls were sacrificed to Proserpine. Demeter and Proserpine were worshipped together by the Athenians at the greater and lesser Eleusinian festivals, held in autumn and spring respectively. In the Eleusinian mysteries Proserpine no doubt played an important part. One Greek writer, Achemus, identified Proserpine with the Egyptian Isis. ¹ At Rome Proserpine was associated with Ceres (the Roman representative of Demeter) in the festival of the Ceralia (April 12 to 19), she was represented as the wife of Dis Pater (the Roman Pluto), and was sometimes identified with the native Latin goddess Libera. The pomegranate was Proserpine’s symbol, and the pigeon and cock were sacred to her. Her votaries abstained from the flesh of domestic fowls, fish, beans, pomegranates and apples. In works of art she appears with a cornucopia or with ears of corn and a cock. ² The regular form of her name in Greek was Persephone, but various other forms occur: Pherephone, Persepha, Pherephassa, Pherrephatta, &c., to explain which different etymologies were invented. Corresponding to Proserpine as goddess of the dead is the old Norse goddess Hel (Gothic Hela), whom Saxo Grammaticus calls Proserpine.

See L. Preller, Demeter und Persephone (1837); R. Foerster, Der Raub und die Rückerkehr der Persephone (1874); A. Zimmermann, De Proserpineae nuptiis et reditu (1882); J. A. Overbeck, ³ Demeter and Kore (Kunstmythologie, 1878). (J. C. F. ² X.)

PROSKUROV, or Floskurov, a town of Russia, in the government of Podol, situated on the railway from Odessa to Lemberg, 62 m. N.W. of Zhermerinka junction. Pop. (1897), 22,015, more than one-half being Jews. It is poorly built, mostly of wood, on a low marshy plain surrounded by hills, at the confluence of the Ploskaya with the Bug. Its old castle has been destroyed, the site being occupied by a Roman Catholic church. The Orthodox Greek cathedral (1839) contains a very ancient and highly venerated image of the Virgin. The manufactures include oil-works and potteries; the Jewish merchants carry on an active export trade in corn and sugar, while the imports consist of salt and manufactured wares. Agriculture and market-gardening are the chief occupations of the Little-Russian inhabitants.

PROSODY (Gr. προσῳδία), the art of versification (see VERSE), including as its three divisions accent, breathing and quantity. Prosody is the mode in which the discipline is determined by which successive syllables are so arranged as to form verse. The Latin name for it was accentus.

PROSPERO (from prospiri, to proceed, from prosper, to prosper) for view, look-out, prospect, from prosperire, to look forward), a written or printed preliminary announcement of some undertaking, giving the scheme or plan, the principal features, &c. In law, the term is specifically applied to the invitation issued to the public by a company to subscribe for shares in the enterprise for which the company is formed (see COMPANY).

PROSPER OF AQUITAINE, or PROSPER TIRO (c. 390-c. 465), Christian writer and disciple of St. Augustine, was a native of Aquitaine, and seems to have been educated at Marseilles. In 431 he appeared in Rome to interview Pope Celestine regarding the teachings of St. Augustine and then all traces of him are lost until 440, the first year of the pontificate of Leo I., who had been in Gaul and thus probably had met Prosper. In any case Prosper was soon in Rome, attached to the pope in some secretarial or notarial capacity. Gennadius (De script. eccl. 85)

¹ Others regarded her as originally a moon-goddess.
² As the wife of Hades she was represented with the insignia of royalty and a torch.
³ As a corollary, a rumour that Prosper dictated the famous letters of Leo I. against Eutyches. The date of his death is not known, but his chronicle goes as far as 455, and the fact that Ammianus Marcellinus mentions him under the year 463 seems to indicate that his death was shortly after that date. Prosper was a layman, but he threw himself with ardour into the religious controversies of his day, defending Augustine and propagating orthodoxy. The Pelagians were attacked in a glowing polemic poem of about 1000 lines, Adversus ingratos, written about 430. The theme, dom' quaod... pestesus somuit colubrern Britannus, is relieved by a treatment not lacking in liveliness and in classical measures. After Augustine’s death he wrote three series of Augustinian defences, especially against Vincent of Lerins (Pro Augustinio responsiones). His chief work was against Cassian’s Colloquy, his De gratia et dei liberation (432). He also induced Pope Celestine to publish an Epistola ad episcopus Gallorum against Cassian. He had earlier opened a correspondence with Augustine, along with his friends Tyrus and Hilarus, and although he did not meet him personally his esteem for the great theologian led him to make an abridgment of his commentary on the Psalms, as well as a collection of sentences from his works—probably the first dogmatic compilation of that class in which Peter Lombard’s Liber sententiarum is the best-known example. He also put into elegiac metre, in 106 epigrams, some of Augustine’s theological dicta.

Far more important historically than these is Prosper’s Epitoma chronicon. It is a careless compilation from St. Jerome in the earlier part, and from other writers in the later, but the lack of other sources makes it very valuable for the period from 425 to 455, which is drawn from Prosper’s personal experience. There were five different editions, the last of them dating from 455, after the death of Valentine. For a long time the Chronicon imperiale was also attributed to Prosper Tiro, but without the slightest justification. It is entirely independent of the real Prosper, and in parts even shows Pelagian tendencies and sympathies.

The Chronicon has been edited by T. Memmen in the Chronica minora of the Monumenta Germaniae historica (1892). The complete works are in Migne’s Patrologia latina, Tome 51. See L. Valentine, St. Prosper d’Aquitaine (Paris, 1900), where a complete list of manuscripts where Prosper is to be found; also A. Potthast, Bibliotheca historica (1896).

PROSSNITZ (Czech Prostějov), a town of Austria, in Moravia, 50 m. N.E. of Brünn by rail. Pop. (1900), 24,054, mostly Czech. It is situated in the fertile plain of the Hana, and is the principal commercial centre for the sale of the various produce of the region. It has important textile, malt and sugar industries, distilling, brewing and milling, manufactures of agricultural implements and lucifer matches. Prossnitz is a town of ancient origin, and in the 10th century was one of the chief seats of the Moravian Brethren.

PROSTITUTION (from Lat. prostituere, to expose publicly), a word which may best be defined as promiscuous unchastity for gain. In German law it is described as Gewerbsmässige Unsch. It has always been distinguished in law and custom from concubinage, which is an inferior state of marriage, and from other criminal and other irregular sexual relations, in which the motive is passion. Prostitution has existed in all civilized countries from the earliest times, and has always been subject to regulation by law or by custom. In Christian countries attempts have repeatedly been made to suppress it, but without success. Its ultimate basis lies in the two most elementary attributes of living things, namely, the will to live and the instinct of reproduction. The one represents the interest of the individual, the other that of the race; and the essential character of prostitution is that it utilizes the latter to satisfy the former, whereas in true sexual passion, as Schopenhauer has pointed out, the advantage of the individual is subordinated to the needs of the race. In practical language, prostitution offers, through abuse of the sexual instinct, a means of livelihood which a certain proportion of women prefer to other means. It is often assumed by philanthropic moralists that no other means are open to them. That may be so in cases in which deception or constraint
PROSTITUTION

has been used, and adverse circumstances—such as lack of friends and a harsh social code—close the door to other occupations; but to suppose that such cases account for prostitution is to misapprehend the problem. The detailed investigations of various observers and the experience of rescue societies prove that the great majority of prostitutes prefer that means of livelihood to others entailing regular work, discipline and self-control. When they really cease to prefer the life, they leave it voluntarily. Otherwise there is extreme difficulty in reclaiming even the few who will consent to try, and permanent success is only attained with a small proportion of them. The earliest attempt at reclamation met with the same result. It was carried out by the Roman empress Theodora, wife of Justinian, herself a prostitute in early life. She established a home for 500 women on the Bosporus, but after a time they could not bear the restraint; some threw themselves into the sea, and eventually the scheme was abandoned. The preference is due to several causes, of which indolence is the chief. Prostitutes are drawn mainly from the lower classes; the life offers them an escape from the toil which would otherwise be their lot. Women who present themselves to the police for inscription on the continent of Europe frequently give as their reason for embracing the life, that they do not intend to work any more. Other causes are love of excitement and dislike of restraint. The same qualities make the criminal and the wastrel. In addition, a large proportion have the sexual appetite developed in an abnormal degree.

Of 3,505 women interrogated by M. Buls in Brussels, 1,118 admitted le droit pour l'homme. The foregoing are primary causes. External conditions which foster any of these tendencies, or destroy the self-respect and sense of modesty which are their natural antecedents, are secondary causes of prostitution. The more important are: (1) difficulty of finding employment; (2) excessively laborious and ill-paid work; (3) harsh treatment of girls at home; (4) promiscuous and indecent mode of living among the overcrowded poor; (5) the aggregation of people together in large communities and factories, whereby the young are brought into constant contact with demoralized companions; (6) the example of luxury, self-indulgence and loose manners set by the wealthier classes; (7) demoralizing literature and amusements; (8) the arts of profligate men and their agents. Alcohol is often an aid to prostitution, but it can hardly be called a cause, for the practice flourishes even more in the most abstemious than in the most drunken countries. These observations apply to the West. In Oriental countries girls are commonly born into or brought up to the trade, and in that case there is no choice.

Among the ancient nations of the East, with the exception of the Jews, prostitution appears to have been connected with religious worship, and to have been not merely tolerated but encouraged. From the Mosaic ordinances and the narrative of the Old Testament it is clear that the separation of the Jews as the chosen people, and the maintenance of their faith, were always felt by Moses and by the later prophets to be cheaply endangered by the vicious attractions of the religious rites practised around them. The code of sexual morality in the Book of Leviticus is prefigured by the injunction not to do after the doings of the land of Egypt; and after the doings of the land of Canaan, where all the abominations forbidden to the Jews were practised; and whenever the Israelites lapsed from their faith and "went a-whoring after strange gods," the transgression was always associated with licentious conduct.

In Egypt, Phoenicia, Assyria, Chaldea, Canaan and Persia, the worship of Isis, Moloch, Baal, Astarte, Mylitta and other deities consisted of the most extravagant sensual orgies, and the temples were merely centres of vice. In Babylon some degree of prostitution appears to have been even compulsory and imposed upon all women in honour of the goddess Mylitta. In India the ancient connexion between religion and prostitution still survived; but that is not the case in China, a most licentious country, and, considering the antiquity of its civilization, and its conservatism, we may perhaps conclude that it formed an exception in this respect among the ancient nations. Among the Jews, who stood apart from the surrounding peoples, the object of the Mosaic law was clearly to preserve the purity of the race and the religion. Prostitution in itself was not forbidden, but it was to be confined to foreign women. Jewish fathers were forbidden to turn their daughters into prostitutes (Lev. xvi. 20), and the daughters of Israel were forbidden to become prostitutes (Deut. xxiii. 17), but no penalty was attached to disobedience, except in the case of a priest's daughter, who was to be burnt (Lev. xii. 9). This distinction is significant of the attitude of Moses, because the heathen "priestesses" were nothing but prostitutes. Similarly, he forbade groves, a common adjunct of heathen temples and a convenient cover for debauchery. Again, his purpose is shown by the severe penalties imposed on adultery (death) and on unchastity in a betrothed damsel (death by stoning), as contrasted with the mild prohibition of prostitution. So long as it did not touch the race or the religion, he tolerated it; and even this degree of disapproval was not maintained, for Jephthah was the son of a harlot (Judg. xi. 2). There is abundant evidence in the Old Testament that prostitution prevailed extensively in Palestine, even in the earlier and more puritan days. The women were forbidden Jerusalem and places of worship; they infested the waysides, and there is some evidence of a distinctive dress or bearing, which was a marked feature of the trade among the Greeks and Romans. In the later period of agrarianism which increased of licentious indulgence which Moses had foreseen took place, associated with infidelity. The people plunged into debauchery, the invariable sign of national decadence, which has always accompanied over-prosperity and security, and has always heralded national destruction. Before leaving the Jews, it may be noted as an interesting fact that the remarkable series of ordinances laid down by Moses in the interest of public health contains unmistakable recognition of venereal disease and its contagious character (Lev. xxi. 11).

Passing on to the ancient Greeks, we find prostitution treated at Athens on a new principle. The regulations of Solon were designed to preserve public order and decorum. He established houses of prostitution (dicteria), which were a state monopoly and confined to certain quarters. The dicteria were forbidden the superior parts of the town, and were placed under various disabilities. They were compelled to wear a distinctive dress, and, so far from being connected with religion, they were not allowed to take part in religious services. These laws do not seem to have been carried out at all effectually, and were

---

2 Neither "harlot" nor "whore" is the Anglo-Saxon for a prostitute, for which the word is milster (so in Matt. xxii. 31). "Whore" came into English from Scandinavian sources. It was not spelled with the initial h till the beginning of the 16th century. The earlier forms are hore or hore. The word appears in many Teutonic languages, as in Swedish, "skamor," in Dutch, "harlot," in German, "Harlot," the same as the New English Dictionary points out, as a less offensive word, is frequent in 16th century versions.

The word "harlot" first appears without its present application as a synonym of "loose women," in the Bible and in the Vulgate. The word was sometimes even with no evil significance at all, as much as we use "fellow." Thus in the prologue to the Canterbury Tales, 647, where theSomouron" is called a "gentil harlot and a kynde." The word comes from Arvota (Arvota is the name of the place of a great feast of the wandering players, actors, jugglers, of the day. The ultimate origin of the Romanic word is unknown. Skeat connects it with the Teutonic word, which appears in Ger. bek, Eng. "churl," which means "man" or "fellow." Like "bigot" (gnot), the word has been fancifully derived from the name of a person, viz. Arletta or Arlotta, the mother of William the Conqueror (William Lambard, 1536-1601, Perambulation of Kent, 1576).
PROSTITUTION

presently relaxed. After the Persian wars more stringent regulations were again introduced. The *diceriades* were placed under police control, and were liable to prosecution for various offences, such as ruining youths, committing sacrilege and treason against the state. It is clear, however, that as time went on the Athenian authorities experienced the difficulties encountered by modern administrations in carrying out state regulation. There were grades of prostitution, socially though not legally recognized, and women of a superior order were too powerful for the law, which failed to maintain the ban against them. The Greek *hetairae*, who were prostitutes, not "mistresses," and the most gifted and brilliant members of their class known to history, wielded great and open influence. The test case of Phryne, in which the stern attitude previously maintained by the Areopagus broke down, established their triumph over the law, deprived virtuous women of their sole advantage, and opened the door to general laxity. In later times any one could set up a *dicerion* on payment of the tax. In other Greek cities extreme licence prevailed. At Corinth, which was famous for sensual practices, a temple, with a huge staff of common prostitutes for attendants, was established in honour of Aphrodite and for the accommodation of the sailors frequenting the port. The worship of this goddess became generally debased into an excuse for sexual excesses.

The Romans united the Jewish pride of race with the Greek regard for public decency, and in addition upheld a standard of austerity all their own. In early days female virtue was highly honoured and strenuously maintained among them, of which the institution of the vestal virgins was a visible sign. Their attitude towards prostitution differed, accordingly, from that of other ancient nations. Among them, alone, it was considered disgraceful to a man to frequent the company of prostitutes; and this traditional standard of social conduct, which markedly distinguished them from the Greeks, retained sufficient force down to the latter days of the Empire. In the name of the Roman with a weapon of rhetorical attack against his political opponents, whom he denounced as *scortatores*. Prostitution was more severely regulated by them than by any other ancient race. They introduced the system of police registration, which is the leading feature of administration in most European countries to-day. From the earliest days of the Republican prostitutes were required to register at the aediles' office, where licences were issued to them on payment of a tax. They were placed under stringent control, had to wear a distinctive dress, dye their hair or wear yellow wigs, and were subject to various civil disabilities; but the severest feature of the system was that, once registered, their names were never erased, and consequently remained for ever under an indelible stain. As in our times, registration became ineffective, and neither law nor tradition could check the demoralizing influence of ease and luxury when once external conquest left the Romans free to devote their energies to the pursuit of pleasure. An attempt was made by the enactment of severer laws against prostitution, to stem the rising tide of immorality, which threatened to taint the best blood in Rome with the basest elements in the later days of the Republic. Citizens were prohibited from marrying the descendants or relatives of prostitutes, daughters of equestrians were forbidden to become prostitutes, and married women who did so were liable to penalties. More stringent regulations were also imposed on prostitutes themselves, in addition to the old disabilities and police system, which remained in force. If these laws had any effect at all, it was to promote the general prevalence of immorality; they certainly did not diminish prostitution. The profligacy of imperial Rome has never been surpassed for gross and obscene sensuality.

The greatest change introduced by Christianity with regard to prostitution was the adoption of a more charitable attitude towards these social and legal outcasts. The 6th-century tax, which had descended to the emperors and had been further regulated under Caligula, was partly given up in the 4th century by Theodosius, on the representations of Florentius, a wealthy patrician, who offered to make good the loss of revenue out of his own pocket. It was fully and finally abolished by Anastasius I. in the next century, and the old registers were destroyed. Then some of the civil disabilities of prostitutes were removed by Justinian in the 6th century. Gibbon, who never gave credit for a good motive when a base one could be found, attributes Justinian's action solely to his desire to marry Theodora, whose life had been notorious; and no doubt he influenced him in the matter, but it is permissible to assume a good motive. Even Gibbon is constrained to admit her virtue after marriage, and to give her credit for "the most benevolent institution" of Justinian's reign, the rescue home for fallen women in Constantinople, which was at any rate disinterested. Though it did not succeed, it marks a turning-point in the treatment of a class which had never met with public sympathy before. At the same time procuration and connivance were severely punished, which is in keeping with the Christian attitude. The early Christian Church laid great stress on chastity, which probably suggested to its Roman persecutors the horrible punishment of forcibly marrying Christian maidens. Such malignity enhanced the glory of martyrdom without shaking the constancy of its victims; and the triumph of purity in an age of unbounded licence was conspicuously recognized by Alaric, the Gothic conqueror, who gave strict orders in the sack of Rome that the virtuous of Christian women was to be respected. The church, however, was not severe upon prostitutes, to whom the altar was open upon repentance, and some of the fathers explicitly recognized their trade as a necessary evil. Among them was St Augustine, a man of the world, who saw that its suppression would stimulate more destructive forms of immorality. Gradually charity degenerated into patronage. Rome, conquered spiritually by Christianity and materially by the northern barbarians, sapped the virtue of both. Before the middle ages the institutions and ministers of the Church became a by-word for vice. Charlemagne made an effort to suppress the brothels, and was responsible for the greater part of the capitularies, which ordained the scourging of prostitutes and panderers, were not inspired by any regard for morality. A period of reform followed. The rise of chivalry, with its lofty idealization of women, and the wave of Christian fervour connected with the Crusades, inspired a vigorous and high-minded campaign against an all-prevailing evil. The Church became exceedingly active in prevention and rescue work, and was assisted by a devout and zealous laity. Rescue missions were organized, convents were founded everywhere for the reception of penitents, and dowries were subscribed to procure husbands. Fulke de Neuliy was a conspicuous figure in this work. He held missions, preached, and collected large sums for marriage dowries. Pope Innocent III. (1205-1216) pronounced it a praiseworthy act to marry a prostitute; and Gregory IX., a few years later, wrote to Germany that brothel-keepers were not to prevent prostitutes from attending missions, and that clergy and laity who derived benefit from prostitution were banned. "Urging bachelors," he wrote, "to marry repentant girls, or induce the latter to enter the cloister." In spite of such efforts, and of occasional spasms of severity by individual rulers, prostitution flourished everywhere throughout the Middle Ages. It was not merely tolerated, but licensed and regulated by law. In London there was a row of "bordells" (brothels) or "stews" in the Borough near London Bridge. They were originally licensed by the bishops of Winchester, according to John Northouck, and subsequently sanctioned by parliament. Stow quotes the regulations enacted in the year 1161, during the reign of Henry II. These were rather protective than repressive, as they settled the rent which women had to pay for the rooms, and forbade their compulsory detention. The act was afterwards confirmed in the reigns of Edward III. and Richard II. In 1383 the bordells belonged to William Walworth, lord mayor of London, who farmed them out, probably on behalf of the Corporation, according to analogy in other parts of Europe. They were closed in 1506, but reopened until 1546, when they were abolished by Henry VIII. In London we get the earliest known regulations directed against the spread of venereal
disease. The act of 1161 forbade the bordell-keepers to have women suffering from the "perilous infirmity of burning"; and by an order of 1430 they were forbidden to administer a bawd's remedy from an "informulas contra praeda." Probably it was by virtue of this order that in 1439 two keepers were condemned to eleven days' imprisonment and banishment from the city. In 1473, again, it is reported that bawds and strumpets were severely handled by Lord Mayor Hampton.

Elsewhere in Europe much the same state of things prevailed during the same period. Prostitution was both protected and regulated, and in many places it constituted a source of public revenue. In France prostitutes were distinguished by a badge, and forbidden to wear jewels and fine stuffs and to frequent certain parts of the town. Public brothels on a large scale were established at Toulouse, Avignon and Montpellier. At Toulouse the profits were shared between the city and the university; at Montpellier and Avignon the trade was a municipal monopoly, and farmed out to individuals; at Avignon, where the establishment was kept up during the whole period of the popes' residence, the inmates were subjected to a weekly examination. In 1245 Louis IX. issued an edict exiling prostitutes and brothel-keepers. If a woman could prove that she was innocent, however, though in this and the succeeding century procuration was punished with extreme severity. In some parts of France prostitutes paid a tax to the seigneur. In Germany, according to Fiducius, the public protection of Lust-Diren was a regular thing in all the large towns during the middle ages. "Frauenhäuser," similar to those in London and in France, existed in many places. They are mentioned in Hamburg in 1292; and from later records it appears that they were built by the corporation, which farmed them. So also in Ulm, where special regulations were issued in 1430. We find them existing at Regensburg in 1306, at Zürich in 1314, at Basel in 1336 and Vienna in 1384. According to Henne-am-Rhyn, admission to these houses was forbidden to married men, clergy and Jews, and on Sundays and saints' days they were closed. The laws of the emperor Frederick II. in the 13th century contain some curious provisions. Any one convicted of a criminal assault on a prostitute against whose wife he was liable to be acquitted. If she made a false accusation she was subject to the same penalty. Any one not going to the assistance of a woman calling for help was liable to a heavy fine. In these ordinances the influence of chivalry may be detected. At the same time prostitutes were forbidden to live among respectable women or go to the baths with them. Hospitality to important guests included placing the public Frauenhäuser at their disposal. So King (afterwards Emperor) Sigismund was treated at Bern in 1414 and at Ulm in 1434, so much to his satisfaction that he publicly complimented his host on it. Besides the municipal Frauenhäuser, there were "Winkelhäuser," which were regarded as irregular competitors. In 1409 the licensed women of Nuremberg complained to the mayor of this unfair competition, and in 1508 they received his permission to storm the obnoxious Winkelhaus, which they actually did. In Italy and Spain the system appears to have been very much the same. At Bologna prostitutes had to wear a distinctive dress, in Venice they were forbidden to frequent the public places, and in both places it was required to leave the neighbourhood on the complaint of other residents. At Naples a court of prostitutes was established, having jurisdiction over everything connected with prostitution. It led to great abuses, was reformed in 1589, and abolished about a century later.

Such was the state of things in the middle ages. In the 15th and 16th centuries a great change took place. It was due to two very different causes: (1) fear of disease; (2) the Reformation. With regard to the first, there can be little doubt that both the slighter and graver forms of venereal disease existed in very remote times, but until the 15th century they attracted comparatively little attention. The constitutional character of syphilis was certainly not understood—which is by no means surprising, since its pathology has only recently been elucidated (see Venereal Diseases)—but one would still have expected to find more notice taken of it by historical, moral and medical writers in classical and medieval times. Nor is it possible to explain their reticence by prudery, in view of the unbounded literary licence permitted in those ages. One can only conclude that the evil was less widely spread or less virulent than it afterwards became. At the end of the 15th century it attracted so much notice that it was supposed to have originated then de novo, or to have been brought from the West Indies by Columbus—both untenable hypotheses; and, as usual, each country accused some other of bringing the contagion within its borders. To speculate on the cause of this increased prevalence would be idle; it is enough to note the fact and its consequences. It was immediately followed by the Reformation, and the two together led to a general campaign against the system of licensed prostitution. The last Frauenhaus was closed in Ulm in 1531, in Basel in 1534 and in Nuremberg in 1567. In London, as already noted, the bordells were abolished in 1546. In Paris an ordinance was issued in 1560 prohibiting these establishments, and later all prostitutes were required to leave the city within twenty-four hours. These instances will suffice to show the general character of the movement. Nor were municipal legal penalties less drastic. It is observed by Henne-am-Rhyn—no friend of toleration—that their suppression was followed by the appearance of the crime of infanticide, by the establishment of hospitals for foundlings and for syphilis. This suggests an indictment against humanity which is hardly justified by the facts. Infanticide was no new thing, and foundling hospitals date from the beginning of the 13th century. Their marked increase and the establishment of syphilitic hospitals came a century later than the Reformation campaign against the Frauenhäuser. The suppression of the latter did not affect the prevalence of prostitution. In the 17th century another spasms of severity occurred. In 1635 an edict was issued in Paris condemning men concerned in the traffic to the galleys for life; women and girls to be whipped, shaved and banished for life, without formal trial. These ordinances were modified by Louis XIV. in 1684. The Puritan enactments in England were equally savage. Fowcation was punishable by three months' imprisonment, followed by bail for good behaviour. Bawds were convicted to be whipped, pilloried, branded and imprisoned for three years; the punishment for a second offence was death. In Hamburg all brothels were pulled down and the women expelled from the town. If these measures had any effect, it was speedily lost in a greater reaction; but they have some historical interest, as the present system was gradually evolved from them. It would be tedious and unprofitable to follow all the steps, the shifts and turns of policy, adopted in different countries during the 18th century for the suppression or control of an incurable evil. They involve no new principle, and merely represent phases in the evolution of the more settled and more systematic procedure in force at the present time. Its chief feature, as compared with the past, is the establishment of an organized police force, to which the control of prostitution is entrusted, coupled with a general determination to put the subject out of sight and ignore it as far as possible. The procedure on the continent of Europe is virtually a return to the old Roman system of registration and supervision, except that now the collection of a state tax, and names can be removed from the register. The objects are the same, namely, public order and decency, with one important addition, which has given rise to much controversy. This is the protection of health. From what has gone before, the reader will have gathered that it is not, as frequently supposed, a new thing. Already in the middle ages the question occupied the attention of parliament in England, and a weekly examination of public women by the barber (the surgeon of that time) was instituted at Avignon. The practice was adopted in Spain from about 1500, and later in many other places. But the abolition of licensed brothels, and the consequent growth of private prostitution, rendered it a dead letter. To meet the difficulty, registration was devised. It was first suggested in France in 1765, but was not adopted until 1778. The present regulations in France are based on the ordinances of that year and of 1780 which in their turn were borrowed from
those of the 16th and 17th centuries, previously mentioned. The theory of the modern attitude towards prostitution is clearly laid down by successive ordinances issued in Berlin. Those of 1700 stated that “this traffic is not permitted, but merely tolerated”; the more precise ones of 1792 pronounced the toleration of prostitution a necessary evil, “to avoid greater disorders which are not to be restrained by any law or authority, and which take their rise from an inextinguishable natural appetite”; and the regulations of 1850 and 1876 are headed: “Polizeiliche Vorschriften zur Sicherung der Gesundheit, der öffentlichen Ordnung und des öffentlichen Anstandes.” This embraces the whole theory of present administration, and if Gesundheit be omitted, is not less applicable to the United Kingdom than to the continent. The last attempt to suppress prostitution in Germany is worth noting, as it occurred so late as 1845. Registration was stopped and the tolerated houses were closed in Berlin, Halle and Cologne. The attempt was a complete failure, and it was abandoned in 1851 in favour of the previous system.

We proceed to state the present condition of the law in France, Germany, Austria and the United Kingdom.

France.—The French criminal law takes no cognizance of prostitution. The subject was omitted from the penal code drawn up by the first Republic, and was never restored, although many attempts were made to introduce legislation, on account of the great disorder which arose. Prostitution is to a certain extent a criminal offence. Paragraph 334 of the code forbids the exciting, favouring or facilitating habitually the debauch of girls or boys under twenty-one years of age; the penalty is imprisonment for six months to two years, and a fine of 50 to 500 francs. If the offence is committed by parents, guardians or other persons in a tutelary position, imprisonment is from two to five years, and the fine 300 to 3000 francs. The regulation of prostitution rests on the law of 1790, which entrusted the preservation of public tranquility to the administrative authorities; these are in Paris the prefect of police, and in other communes the mayor. The Parisian regulations have been built up by the decrees of successive prefects. They are based on those of 1778, which fell into abeyance at the Revolution, were reintroduced in 1816, amended in 1823, and made complete in 1830 and 1841. Those adopted in other towns do not differ in any essential particular. The more important points are: (1) registration of prostitutes, which is either voluntary, or compulsory after repeated arrest; (2) recognized brothels, which are of two classes—maisons de tolérance (residential) and maisons de passe (houses of call); (3) medical examination, which is weekly at the maisons de tolérance, while other registered prostitutes must present themselves fortnightly at the dispensary; (4) hospital treatment of those found diseased; (5) rules with regard to solicitation, the frequenting of public places, &c. A small fee is paid for examination. The penalty for infraction of regulations is imprisonment; offences are divided into two classes: (1) slight, (2) grave, and the term of imprisonment varies accordingly from fourteen days to one year. Names may be erased from the register on the following grounds: (1) marriage, (2) organic disease such as to render the calling impossible, (3) return to relations and proof of good behaviour. The whole procedure appears to rest on grounds of doubtful legality. Prostitution never comes before the courts which alone can try offences and pronounce sentence. The police have no power to do so, yet they both try and sentence these women. That is to say, the whole system depends on their doing, by some verbal quibble, what they have no power to do. The question came before the court of Reims in 1856, in the case of two women who refused to submit to medical examination, and the judge decided in their favour. He was dismissed in consequence, which does not make the situation more satisfactory.

Germany.—The German law is more explicit and more logical. Prostitution is not forbidden, but by paragraph 361 of the Imperial Code women are liable to arrest for practising prostitution without being under police control, and for contravening regulations after they have been placed under such control. This brings the traffic completely under the police, and gives legal sanction to their regulations. These vary to some extent in different places, but their general tenor is the same. They include compulsory registration and weekly or semi-weekly medical examination, together with rules, for the most part extremely strict, with regard to public demeanour and conditions of life. In Hamburg, for instance, prostitutes are confined to certain streets or houses, forbidden to share lodgings with persons not registered, to have female servants under twenty-five years of age, to keep children after school age, to admit young men under twenty, to make a noise or quarrel, to attract attention in any way, to go out between two and five in summer, to frequent certain parts of the town, or public balls, or superior seats in the theatre, to remain out after 11 p.m. (Regulations of 1880). On proved reclamation, supervision may be relaxed or names struck off the register. Generally, the women are compelled to contribute a fixed sum to a sick fund, for defraying the cost of medical examination; and in some places also to a journey fund, which is applied to sending strangers to their homes. Brothels are absolutely illegal throughout Germany. Paragraph 180 of the Imperial Code (1876) made Kuppelei a penal offence. Kuppelei is defined as promoting prostitution, either by procuration or by providing facilities of any kind. There is (1) ordinary Kuppelei, or simply assisting prostitution for gain, and (2) aggravated Kuppelei, which includes false pretences and procuration by parents, guardians, teachers, &c. The penalty for the former is a short term of imprisonment and police supervision; for the latter, penal servitude up to five years. It is obvious that if this law were strictly enforced, it would amount to suppression, for every householder or houseowner who harboured a prostitute would be liable to prosecution. Its actual interpretation, however, is very elastic. A law passed in Prussia in 1900 has for its object the reclamation of the young. Girls under eighteen may be placed under control until they are twenty-one.

Austria.—The Austrian law goes farther than the German, and is still more inconsistent with the existing practice. By paragraph 5 of the Criminal Act of 1883 prostitution is actually forbidden, but permission is given to the police to tolerate it under conditions, and to prescribe regulations according to circumstances. Power to punish is also given to the police. Only certain cases of prostitution are liable to criminal prosecution, namely, when continued after police punishment, with disregard of regulations, when practised by persons suffering from venereal disease, and when accompanied by public scandal. Seduction of the young is punishable by imprisonment, eight days to six months; living on the prostitution of others, by eight days to three months. Kuppelei is a penal offence. Simple Kuppelei include (1) harbouring prostitutes for the purpose of pursuing their trade, (2) procuration, (3) having any connection with the traffic—penalty, three to six months’ imprisonment; qualified Kuppelei is (1) procuration of innocent persons (equivalent to use of false pretences), (2) procuration by parents, guardians, &c.—penalty, one to five years. The police regulations and procedure are similar to those in Germany, but less strict. In all these countries a special service of police is employed.

Great Britain.—The English law differs markedly from the foregoing. It regards prostitution solely as a public nuisance, and dates from the middle of the 18th century. The principal act (25 Geo. II.) was passed in 1755, making perpetual a previous act of 1752. It is entitled “An act for encouraging prosecutions against persons keeping bawdy-houses,” and provides that two ratepayers, on giving notice to a constable, may go with him before a magistrate and obtain an order for proceeding against the persons in question. A further act was passed in 1763, fixing the penalties, and a third in 1818 (58 Geo. III.), enabling the overseers of the parish to take the requisite proceedings. Thus machinery was provided for dealing with brothels, but it was left to the public to put it in motion. The Vagrancy Act of 1824 enables the police to proceed against “common prostitutes.
for behaving in a riotous or indecent manner,” and also forbids indecent literature. This was strengthened by a special act (1839) applying to London only, for the prevention of “loitering for the purpose of prostitution or solicitation, to the annoyance of passengers or inhabitants.” Other large towns have since obtained private acts for the same purpose. The penalties are fines and short terms of imprisonment. In 1847 an act was passed making it an offence for publicans to allow “common prostitutes to assemble and continue” in licensed premises. The Licensing Act of 1872 contains a provision to the same effect. The previous law for dealing with brothels by indictment was strengthened by the Criminal Law Amendment Act of 1885, which renders “any person who keeps, manages or acts or assists in the management of a brothel,” and any owner or occupier who knowingly permits the same, liable to summary conviction under the Summary Jurisdiction Act; penalties for first offence, a fine up to £20, or imprisonment up to three months, increased for second offence to £40 and four months respectively. The same act also strengthened the law, which had previously been very weak, for the protection of the young and the prevention of procuration. It makes the procuration or attempted procuration of any girl or woman “to become a common prostitute” a misdemeanour punishable by two years’ imprisonment, and places the following offences on the same footing: procuring defilement by threats, fraud or drugs; compulsory detention for defilement or in a brothel; procuring the defilement of girls under twenty-one; inducing them to leave the kingdom or to leave home and go to a brothel, with intent. The defilement of girls under sixteen and over thirteen years of age is also a misdemeanour, and subject to the same penalty; the defilement of girls under thirteen is felony, punishable by penal servitude from five years up to a life-sentence. Owners or occupiers of premises conniving at these offences are equally liable.

No account of the law in the United Kingdom would be complete without some reference to the partial adoption of the system of examination as employed elsewhere in Europe in 1864–1883. In 1864 a Contagious Diseases Prevention Act was passed providing for the compulsory medical examination of prostitutes, and detention in hospital of those found diseased, in the following garrison towns: Portsmouth, Plymouth, Woolwich, Chatham, Sheerness, Aldershot, Colchester, Shorncliffe, the Curragh, Cork and Queenstown. The legal machinery was a justices’ order granted on sworn information that the woman named was a common prostitute. “The Act having proved very inefficacious” (judge advocate-general in House of Commons, April 1883), it was amended in 1886 and extended to Windsor. Two years later an important memorial was drawn up by the royal colleges of physicians and surgeons in favour of the acts and their extended application, and in 1886 they were further amended and applied to Canterbury, Dover, Gravesend, Maidstone, Southampton and Winchester—eighteen places in all. A popular agitation, based on humanitarian and moral grounds, and on the evidence of the medical examination, led to the appointment of a royal commission in 1871 and a select committee in 1879. The direct evidence was strongly in favour of the acts, alike with regard to the diminution of disease among the troops in the protected towns, the absence of complaints and the good effect on public order, to which clergymen and other residents testified. The majority of the committee reported accordingly after three years’ inquiry; but in 1883 the House of Commons passed a resolution, by 182 to 110 votes, condemning the compulsory examination of women. As this would have entailed refusal to vote the money required to carry on the system, it was immediately dropped, and the officers of the metropolitan police to whom its execution had been entrusted were recalled. In 1886 the C. D. Acts were repealed.

In India the system was introduced for military cantonments in 1865; partially suspended at the end of 1884, and stopped in 1888 on account of the action of the House of Commons. A new Cantonnement Act was applied in 1889, and an amending act in 1893, by which the compulsory or periodical examination of women was prohibited. In consequence of the enormous increase of syphilis which followed, a new order was made in 1897, which gave power (1) to call on persons suffering from a contagious disease to attend the dispensary, (2) to remove brothels, (3) to prevent the residence or loitering of prostitutes near cantonments.

The foregoing summary of existing laws and regulations sufficiently indicates the present methods of dealing with prostitution. All Western nations broadly follow one or other of the systems described, though the local regulations may vary somewhat in minor details. The French system of recognized houses, with registration, police des mœurs, &c., obtains in Belgium, Russia, Hungary, Spain and Portugal; Italy adopted it in 1855, but abandoned it in 1888 for a modified system; in the Dutch towns maisons de tolérance are permitted with or without a service des mœurs; Norway has abandoned registration, except in Bergen and Trondhjem, but otherwise Scandinavia rather follows the German principle of non-recognition, with more or less vigorous policing; of the Swiss cantons, some have the French, others the German system; while the United States and the British self-governing colonies incline more to the English model of comparative freedom, without a moral police or one possessing arbitrary executive powers independent of the courts of justice. All the systems have their defects; all fail to fulfil their purpose in the great cities. The most modest aim is to preserve public order and propriety. This object is better secured on the continent of Europe than elsewhere, but at the cost of submitting to an arbitrary police rule, intolerable to a free people. There appears to be less prostitution, both visible and actual, in Italy than in other countries. Under the English system the streets can be, and sometimes are, kept orderly in provincial towns by an energetic police; but in London the mass of prostitution is so great that the police seem totally unable to cope with it. Important thoroughfares and centres are frequented by large numbers of prostitutes in broad daylight, and choked by them at night. The law with regard to loitering is a dead letter, for these women do nothing but loiter. Flagrant solicitation is to some extent repressed, but for the most part the police content themselves with preventing positive tumults, and do not always succeed in that. On the other hand the less obvious but more pernicious nuisance of the brothel prevails to a far greater extent on the continent of Europe. Under the French system it is, of course, encouraged, in preference to “surreptitious” prostitution; but under the German it is forbidden. The facts here afford a proof of the impotence of the law no less striking than the condition of the London streets. By the German and Austrian criminal law, quoted above, brothels are prohibited, yet they abound in both countries. In Austria they are recognized, and perhaps the logic of the law is saved by permissive police clauses. In Germany it is not so. Paragraph 180 absolutely forbids the keeping of a brothel, and in Berlin it is act of offence. Elsewhere brothels not only existed, but were recognized by authority for years after the passing of the laws against Kuspelei. It was not until 1886 and 1889 that they were nominally abolished in Hamburg and Saxony respectively. Yet they still exist in most or all of the large towns, with the knowledge and consent, if not with the permission, of the police. In some they are even authorized. Berlin, which is more severely policed than any town outside Russia, is an exception. There brothels are not openly winked at, but the police have to deal annually with 16,000 or 17,000 charges of Kuspelei, and the number remains very constant, from which it may be inferred that the law, even when logically and energetically carried out, is quite ineffective. The European system of registration is more substantial. In Russia, where the authorities have the means of knowing the movements and habits of every individual, it may be possible to compel the registration of the majority of prostitutes, but in other countries it is impossible. The police everywhere complain of the amount of "clandestine" prostitution, which they
cannot control, and which tends always to increase, under the system, while the roll of inscribed women dwindles. The numbers alone are sufficient to prove the failure of the procedure; for instance, 311 and 270 in Dresden and Munich respectively (Zehnder 1891), both capital towns and cities of pleasure containing over 300,000 inhabitants. Cologne, with only half the population, had double the number on the register at the same time. In Paris, which may be called the headquarters of Western vice, the disproportion between registered and clandestine prostitution has reduced the whole system to an absurdity. The number of women on the roll is not a tenth of the estimated number of prostitutes; nor is Berlin, with about 3000 on the register, any better off. In Bordeaux, Brest, Lille, Lyons and Marseilles the same process is going on (Reuss). It follows that the protection of health, which is the object aimed at by registration, is delusive in an equal degree. There are no means of ascertaining the amount of venereal disease existing in any town or country, except in Norway, and consequently, no data for comparing one period or one place with another; but we know that all forms of such disease are still very prevalent in all large European towns, in spite of the system. The only exact figures available are the military returns, which are of some value. It is in garrison towns of moderate size that compulsory registration is likely to be most efficiently carried out and to produce the most decided results, because the women with whom soldiers consort are by their character and habits least able to elude the vigilance of the police. The following table gives the proportion of admissions to hospital from all forms of venereal disease in the German, French, Austrian and British forces for twenty years from 1876. It may be added that the proportion in the Russian army is almost identical with the French, while the Italian figures are slightly higher than the Austrian.

It is therefore unnecessary to give them:—

**Admissions per 1000 in European Armies.**

The striking thing in this table is the enormous difference between the continental and the British figures. To make the comparison more complete, we will add the following, which gives the average admissions per 1000 for the three years 1850–1852:—

It is clear at once that troops in the East stand upon an entirely different footing from those in the West, the Dutch figures being even higher than the British; we may therefore put them aside for the moment. Comparing the rest, we notice that not only are the British figures enormously higher than the other European, but the latter also show very large discrepancies; and since all the foreign troops are under the same protective system, we may conclude that other factors must be taken into account. The discipline maintained, the character of the soldiers themselves, and the procedure with regard to admission into hospital, do not affect the returns. Further, a sort of epidemic rise and fall is to be noted. All the returns given in the first table show a simultaneous rise for several years, beginning with 1876; and having reached a maximum, each shows a progressive fall, likewise lasting over several years. This points to another disturbing factor. It is convincingly shown by the figures for the protected districts in the United Kingdom before, during, and after the period of protection. In 1864—that is, just before the first Contagious Diseases Act came into operation—the proportional figure was 260; ten years later it had fallen to 126; but in 1883 it had risen again to 234, in spite of the protection. Then, protection being removed, it rose to 276, but afterwards fell again progressively to 191 in 1895, without any protection. It is therefore evident that in interpreting the statistics allowance must be made for large fluctuations due to causes quite independent of the protective system. The margin of difference, however, between the British and European returns is so large that, when all allowances have been made, it is not improbable to suppose that a considerable degree of real protection is afforded to soldiers by the system. This conclusion is confirmed by the comparatively high returns for the army of the United States, and still more by the Indian statistics. They rose gradually, it is true, during the cantonment system, but when that was dropped disease increased with shocking rapidity. Between 1887 and 1895 the admissions for primary syphilis rose from 75.5 to 174.1 per 1000, and those for secondary syphilis from 29.4 to 84.9.

The broad conclusion is that under special conditions, and when rigidly enforced, registration and medical examination do to a considerable extent fulfill the purpose of protecting health. Their failure to do so among the population at large and under the ordinary conditions of life is not surprising when we regard the amount of venereal disease which still occurs even among soldiers protected by the most rigorous measures and under the most favorable conditions.

A general view of the whole subject suggests no pleasant or hopeful conclusions. Prostitution appears to be inseparable from human society in large communities. In different countries and ages it has in turn been patronized and prohibited, ignored and recognized, tolerated and condemned, regulated and let alone, flaunted and concealed. Christianity, the greatest moral force in the history of mankind, has repeatedly and systematically attacked it with a scourage in one hand and balm in the other; but the effect has been trifling or transient. Nor have all the social and administrative resources of modern civilization availed to exercise an effective control. The elementary laws on which prostitution rests are stronger than the artificial codes imposed by moral teaching, conventional standards or legislatures; and attempts at repression only lead to a change of form, not of substance. It survives all treatment; and though it may coexist with national vigour, its extravagant development is one of the signs of a rotten and decaying civilization. In Western communities the traffic is not carried on so openly as in the East, nor is it exploited for purposes of public revenue, as among the ancients and in the middle ages; a veil of reticence and secrecy, for the most part of a transparently flimsy character, is thrown over it; but whatever is gained in public decency is counterbalanced by other attendant evils. Two, in particular, are fostered by the policing of prostitutes. One is the system of blackmail levied by the executive. The scandal has been most notorious in the United States, but it exists everywhere, and is a constant source of profound corruption. The other is the growth of the most degraded class that ever disgraced the name of man—the creatures who live upon the earnings of individual prostitutes, with whom they cohabit. They are called souteneurs in France, louisi in Germany, cadets in New York, and by various slang names in Great Britain. They are all criminals. They flourish chiefly on the continent of Europe, where they exist in large and ever-increasing numbers; but they find their way everywhere, and are a dangerous
PROSTYLE—PROTECTION

menace to society. They are not altogether new. The Elizabethan drama is full of references to men who took toll of prostitutes in return for protective services in the old days of persecution; but they have been greatly fostered by the modern system, under which women find it necessary or convenient to have the cover of a man, who can pass for a husband and baffle the police. Thus the law is evaded on the one hand by the corruption of those who administer it, and on the other by the appearance of a class of criminal idlers more degraded than any other—both greater evils than the traffic which the law is intended, but fails, to control. There are no data for comparing the extent of profligacy at present existing in Western communities with that in other countries or in former times, but the unmentionable facts which come constantly to the knowledge of the polizei, and less frequently to the ears of doctors, and lawyers, leave no doubt that in intensity of vice the great centres of modern civilization have nothing whatever to learn from Corinth, imperial Rome, ancient Egypt or modern China. The classical obscenities dug up and relegated to museums are far surpassed by the photographic abominations prepared to-day in Paris or in Amsterdam. The gross perversion and abuse of the sexual instinct implied by these excesses may be a passing phase, but it is a phase which has always marked the decadence of great nations. It is undoubtedly accompanied by a general tendency towards increase of the volume of prostitution. Improvements in the conditions of life among the poor ought to tend in the opposite direction, by removing one of the most potent causes of the traffic, but it is more than counterbalanced by the rising standard of luxury and comfort which accompanies it, by the aggregation of the people more and more into great cities, and by their craving for amusement. The growth of prostitution has already left its mark on the marriage- and birth-rates of the most highly civilized Western communities.

In 1900 the Prussian Government made an attempt, with the co-operation of municipal corporations, to diminish the amount of venereal disease prevalent in the kingdom. Circular questions were addressed to all members of the medical profession requesting them to report the number of patients suffering from those disorders in their practice at the date of the 1st of April. Answers were sent in by 63%, and the aggregate number of patients was 40,902. From thist datum it is calculated that the number of persons attacked in the course of a year is at the very least 300,000 in Prussia alone (Vide Hygienische Rundschau, April 1902).

PROSTYLE (Gr. προθις, before, and στοιχεῖον, a column), in architecture, a portico in which the columns project from the building to which it is attached.

PROTAGORAS (c. 481-411 B.C.), Greek philosopher, was born at Abdera. He is known as the first of the Sophists (g.v.), i.e. he was the first to teach for payment. It is said that he received nearly £400 from a single pupil. He learned philosophy in the Ionic school, and was perhaps a pupil of Democritus, though this is doubtful on chronological grounds. He was an older contemporary of Socrates. He was so highly esteemed by Pericles that he was entrusted with the task of framing laws for the new colony of Thurii (Plut. Pericles, 36). At the age of seventy, having been accused by Pythodorus, and convicted of atheism, Protagoras fled from Rome to Africa, where he was attacked by such as viewed his teaching to Plato (Prot. 318 E) he endeavoured to communicate "prudence" (διάθεσις) to his pupils, "which should fit them to manage their households, and to take part by word and deed in civic affairs." The education which he provided consisted of rhetoric, grammar, style and the interpretation of the poets. His formal lectures were supplemented by discussions amongst his pupils. He left behind him several treatises, of which only a few fragments have survived. In Truth, by way of justifying his rejection of philosophy or science, he maintained that "man is the measure of all things—of what is, that it is, and of what is not, that it is not." Besides Truth, and the book Of the Gods which caused his condemnation at Athens, Diogenes Laërtius attributes to him treatises on political, ethical, educational and rhetorical subjects. Protagoras was the first to systematize grammar, distinguishing the parts of speech, the tenses and the moods.

PROTECTION, in economics a system of commercial policy and a body of doctrine, which in their modern forms are the outgrowth of the commercial and industrial development of the 19th century. The common definition of protection as a policy is the attempt to develop a manufacturing industry by a system of discriminating duties upon manufactured goods imported from foreign countries. But this is far too narrow a definition to suit the modern use of the term, though the notion of discriminating tariffs is common and, we may say, basal to all definitions. Protection as a policy includes not only discriminating tariffs, but also a large number of other features supplementary to this fundamental one and designed to emphasize its purpose. Thus a scheme of bounties and premiums, of rebates and drawbacks, is everywhere considered an essential element of the protective system. Nor is it any longer limited to the encouragement of manufactures, but includes as well the protection of agriculture, forestry, mining, fishing, shipping, &c. In short, one cannot give a comprehensive and satisfactory definition of protection to-day without giving it a much wider scope than that of a system of protective duties upon manufacturing industry.

Many of its advocates claim, and with some show of reason, that the term protection, as now used to describe the commercial policy of a nation, should be so defined as to include all the means by which a country undertakes to secure through the positive efforts of the government the complete industrial and commercial development of all its resources and of all its parts. As its object is thus comprehensive, its justification is to be found in a series of arguments based upon political, economic, and social considerations.

From this point of view the protective policy embraces not merely the system of discriminating import duties in favour of home products—industrial, agricultural and mining, with which the policy began in the United States, for example—but also the system of bounties offered for the introduction and establishment of new industries; the policy of restricted immigration of the less desirable classes of labourers, combined with the positive inducements to the skilled labour of other countries to transfer itself to the one in question; the system of discriminating or prohibitive tonnage duties, known as Navigation Acts; the system of developing foreign markets by an active policy directed towards securing advantages for home products in foreign countries—in a word, all those pecuniary or other sacrifices which a country may make in order to develop its material resources and establish, develop and foster industry, and commerce. In this wide sense the comprehensive policy adopted by the United States, for example, includes the making of a careful geological and botanical survey of the whole country in order to discover and open up the vast natural wealth of its domain in its mines, forests and fields; the establishment of experimental stations to test the usefulness of new crops or means of making old crops more valuable; the stocking of its rivers with fish and the aforesting of its mountains; the introduction of new or more valuable breeds of livestock; the building of railways and canals, and the offering of inducements to private parties to undertake similar enterprises; the deepening of its
rivers and harbours, &c.; and, finally, the development, at public expense, of a scheme of technical and commercial education—lower and higher—adapted to discover and train all the talent in the community available for developing the industry and commerce of the country.

If such an account of the features of a protective policy is objected to on the ground that free trade countries like Great Britain have also adopted some of them, it may be replied that in so far as they have done so they have adopted the principle of protection, namely, that government shall adopt a positive policy looking towards the development, by government aid if necessary, of new branches of commerce and industry and the firmer establishment of old branches. It may further be pointed out that the countries which have adopted the protective policy most fully—the United States, France, Germany and Russia—have most consistently followed out the policy here indicated and in all these countries it has been the so-called protectionist party which has identified itself most fully with the comprehensive policy here suggested.

As a doctrine, protection is the set of principles by which this policy of government aid to industry is justified, and these principles have been elaborated hand in hand with the development of the so-called protective policy sometimes outrunning its actual application and advocating its further extension, more often lagging behind and seeking for means of explaining and defending what had already been done. The present development of the system and theory of protection is a result of the growing predominance of capitalism in modern society, combined with the tendency of modern politics towards the organization and development of great national states, with the resulting desire to secure their industrial as well as their political independence. It has been further favoured in certain ways by the fact that the financial needs of modern states require a resort to indirect taxation, thus making it possible for the aggressive forces to exploit the tax system for their own benefit; while the wars of the 19th century have favoured in many ways the tendency towards the adoption of special means, like high discriminating duties, to accomplish this end. Hand in hand with this has gone a steady tendency to see in the state a powerful means of promoting the development of trade and industry, and a growing disbelief in the more extreme forms of the free trade doctrine, such as the type known as the Manchester School, the theory of the laissez faire, laissez passer school of economics and politics.

Protection, both as a doctrine and policy, can be best understood by examining the course of its development in those countries adopting it most consistently. Germany and the United States offer the two striking examples of great modern nations adopting a system of protection and developing under its influence. They may in a certain sense serve as types of the kind, the former of the 19th century adopted and defended, in its politics at any rate, the so-called protective system. In both cases the high protective system was associated with the development of nationality, of industry, of capitalism, and of a financial system which favoured the growth of certain elements of the protective policy.

The protective system in the United States began with the adoption of the Constitution in 1789, and found its first formal defence in the celebrated report of Alexander Hamilton on manufactures. The argument and the movement were largely academic. As there was no strong manufacturing interest in existence, there was no organized capitalistic effort to secure manipulation of the tariff duties in the interest of special industries. There was general agreement, however, that it would be desirable to develop a manufacturing industry in the colonies if it were practicable. A high degree of natural protection was already afforded by the cost of transportation. It was felt, therefore, that a small duty on manufactures would probably serve the purpose, since the development of the manufactures would favour the production of raw material, which would therefore need no special encouragement. It was also felt that a small duty, continued for a few years, would result in the establishment of the industry on such a firm basis that all duties might be abolished. The introduction of this form of protection, i.e. discriminating duties upon imported goods, was greatly assisted, if not originally caused, by the fact that the new government needed money which could most easily be obtained by customs duties. Thus all those parties which were opposed to direct taxes joined their efforts with those interested in securing protective duties, in order to commit the government to the policy of basing its revenue system on a tariff on imports. To these considerations must be added the further one that the country had just thrown off political dependence on Europe, and felt that it must now become industrially independent also, if it were to be a great nation. These influences, then, namely, the desire of the statesmen of the time to create a revenue system for the Federal government which would make it absolutely independent of the states; secondly, the wish to develop an industry which would serve the needs of the army while it promoted its complete independence of the Old World, conspired to commit the Federal government from the beginning to a policy of protection based upon a system of discriminating duties. At the same time a system of discriminating tonnage dues and prohibitory regulations relating to foreign shipping in the coasting trade was adopted to promote and foster the shipping interest.

Industry and commerce began to thrive as never before, largely because of the absolute free trade which the Constitution had secured among the states of the Union. The long struggle between France and Great Britain, extending from 1806 to 1812, for the possession of the commerce and the trade of the world, combined with the retaliatory measures of the American government itself, practically destroyed American commerce for a time, and finally led to the British-American War of 1812, which closed in 1815. The financial system of the Federal government during this war was based on getting the largest amount of revenue that the American people could be induced to pay, so that the duties were progressively raised up still higher. The ten years period of non-intercourse, while it had seriously injured American commerce, had fostered the growth of American manufacturing; and when the close of the War of 1812 brought with it an enormous influx of foreign goods, particularly from the plethoric warehouses and factories of England, it looked for a time as though the new American industries were destined to vanish as rapidly as they had grown up. And now for the first time appeared a strong, well-developed, capitalistic party, which was, in spite of some drawbacks, destined to grow until it became one of the most characteristic features of the politics of the republic.

The manufacturers of the country determined the tariff policy of the country, and with few reverses pursued a steadily advancing course of victory down to the close of the 19th century. They secured the maintenance of high duties at the close of the War of 1812, and managed to increase them steadily until the reaction of 1830-1833, when they were forced to content themselves with a lower rate, which continued, with a slight interruption in 1842-1846, until the outbreak of the Civil War in 1861. This was an opportunity which they knew how to utilize to the greatest advantage. During the war, when the government was forced to exploit every possible source of revenue, the protectionist party knew how to turn the necessities of the government to its advantage. The rate of duties was pressed ever higher; and when the war closed, and the taxes could again be lowered, the protectionist managers knew how to lower or remit altogether the non-protective duties, and thus keep high, and even advance to a still higher point, the duties which protected them from foreign competition.

In the meantime the country was turning from agriculture to manufactures at an unprecedented rate. The manufacturing party was becoming ever stronger and more aggressive. As it had also been the national party, it profited by the enormous development of the nationalist sentiment during and after the war. It now became patriotic to favour the development of a national industry. It was treason to advocate free trade—that had been the policy of the slave-holders' party, and the Slave-
holders’ Rebellion, as the Civil War was called, had drawn its strength largely from the free-trade sentiment. The policy of the protectionist had expanded with the growth of the country and the necessity of coming to terms with the antagonistic elements. Thus at first the platform of the protectionists had been one of reasonably low duties on manufactured commodities, low duties on half-manufactured and no duties at all on raw material. But as the country advanced, and it was seen how the interests of manufacturing had been quickened by the policy of discrimination, those engaged in producing raw materials and half-manufactured commodities demanded that they too should be considered. As this concession had to be made by the manufacturers, they were compelled to justify it by other arguments than those used at first. The infant-industry argument gave place to the proposition, that as long as the prices of raw materials and labour were higher in America than abroad, it would be necessary to maintain countervailing duties at least equal to this difference, in order to protect American industry. One branch after another of manufacturing or agriculture was included and given the benefit of protection. In order to have satisfactory theoretical basis for such a policy, the theory was advanced that foreign trade was a necessary evil, to be diminished as much as possible. The ideas were advanced and sprang up in a country which was rapidly forging ahead to take its place among the greatest of existing nations, and with an ever-increasing self-consciousness was ready to assert itself among the nations of the world; it has stood for free labour against slave labour, and consequently profited here again in a country whose greatest conflict turned upon the question whether the system of slave labour should be extended or not; it has stood for high wages for American labourers, and in words at any rate has advocated a policy directed to protecting them against competition with the “pauper labour” of the Old World. It has stood for government activity in the direction of developing railways and canals; of establishing education upon national lines, making it free, in all grades from the kindergarten to the university, to all citizens of the republic, and it has profited by this association in a country where all influences were telling in favour of this tendency. In short, whatever one may think of the wisdom or folly of trying to develop national industry by a system of discriminating duties, the protectionist policy has been on the progressive side of so many of the deep questions of national importance that it has obtained and kept the allegiance of thousands of men who would have been glad to see a change, or indeed a reversal, in the tariff policy of the party.

The history of the tariff policy in Germany had been very similar to that of the United States. Beginning with the establishment of absolute free trade among the various German states in the earlier customs union, it extended this policy, by the establishment of the North German Confederation and the new German Empire, to all the states now included in the federation. The long-wished-for political union meant political independence, and when political independence was once achieved, industrial and commercial independence were next desired. Within the empire itself it was necessary, if the new organization were to be strong and vigorous, that the central government should become independent of the individual states; and this could be best effected by giving it a revenue system based upon import duties, which in the long run has enabled the central government to subsidize the state governments, and thus bring them still further under its influence. To develop this system the political support of some strong party was needed. This party was found in the protectionist elements, which have thus again become the national party in a state which was being rapidly nationalized; the industrial party in a society which was rapidly passing from the agricultural to the industrial condition; the capitalist party in a society which was rapidly becoming capitalistic in all its tendencies. It stood for industrial and commercial, as well as political, independence of other countries, and thus satisfied the longing for national unity and independence of a people which had suffered for centuries from disunion and dependence.

These two examples may serve to explain how the two most powerful forces of our 20th century have been born, and how they both opened the 20th century with a more openly declared and a more fully developed system of protection than ever before.

Protection as a theory or doctrine is to a certain extent an outgrowth or modification of the old doctrines of mercantilism. In its modern form, however, it dates really from the celebrated report on manufactures made by Alexander Hamilton when secretary of the U.S. Treasury in the year 1791. The views there advanced have been further developed by Friedrich List and Henry C. Carey, and have in later years been carried along somewhat different lines to their logical conclusions by Simon N. Patten and George Gunton. Starting from an argument in favour of temporary duties on manufactured goods imported from abroad until such time as the infant industry might take firm root, the development proceeded through List, who favoured the maintenance of such duties until the country had passed into the manufacturing stage as a whole, and then through Carey to Patten and Gunton, who maintained the principle, extended to cover agriculture, trade and mining, should be preserved as the permanent policy of the country until the entire world is one nation, or all nations have reached the same level of political, economic and social efficiency. The protective policy, which a century ago was to be, in the view of its advocates, temporary and partial, has become to-day, in the arguments of its apologists, permanent and comprehensive. We must content ourselves here with a brief statement of the arguments of the leading and most successful defenders of modern protectionism.

Alexander Hamilton, at that time secretary of the treasury, submitted his celebrated report on manufactures to the Congress of the United States on the 5th of December 1791. It is in a certain sense the first formulation of the modern doctrine of protection, and all later developments start from it as a basis. It is a positive argument directed to proving that the existence of manufacturing is necessary to the highest development of a nation, and that it may be wisely promoted by preferential duties; and the most important is a system of discriminating duties upon foreign imports. Among the objects to be attained by the development of a flourishing manufacturing industry are mentioned: (1) Independence of foreign nations for military and other essential supplies. (2) A positive augmentation of the produce and revenue of society, growing out of division of labour, (3) extensive use of machinery, (4) additional employment to classes of the community not ordinarily engaged in business. (5) An increase in the immigration of skilled labourers from foreign countries. (6) A greater scope for the diversity
of talents and dispositions which discriminate men from each other. (2) A more ample and various field for enterprise. (3) In many cases a new, and in all a more certain and steady demand for the surplus produce of the soil. (4) A more lucrative and prosperous trade than if the country were solely agricultural.

Among the feasible means of promoting the development of such an industry he mentions the following: (1) Protective duties, or duties on foreign articles which are the rivals of the domestic ones, to be encouraged. (2) Prohibition of rival articles or duties equivalent to prohibition. (3) Prohibition of the exportation of the materials of manufactures. (4) Pecuniary bounties. (5) Premiums. (6) Exemption of the materials of manufactures from duty. (7) Drawbacks of the duties which are imposed on the materials of manufactures. (8) The encouragement of new inventions and discoveries at home, and the introduction into the United States of such as may have been made in other countries; particularly those which relate to machinery. (9) Judicious regulations for the inspection of manufactured commodities. (10) The facilitating of the pecuniary remittances from place to place.

The above protections contain the outline of a comprehensive scheme for developing the manufacturing resources of the country, and the United States has subsequently adopted, in one form or another, almost all of these propositions. Hamilton considered that the duties, &c., would not have to be very high or very long continued in order to accomplish their legitimate ends, after which they would become unnecessary, and would naturally be abolished. He conceded that, generally speaking, import duties were taxes on the customer, and therefore burdens—but burdens which might well be temporarily borne for the sake of the ultimate advantage arising from cheaper goods and diversified industries. He emphasized also the advantage of a home market for agricultural products, and seemed to think that the United States had to pay the cost of transportation both on the agricultural products it exported and the manufactured goods it imported. This report remained the armoury from which the protectionists drew their weapons of offence and defence for two generations, and it has not yet ceased to be the centre around which the theoretical contest is waged even to-day in Germany and France as well as in the United States.

The next great theorist in this field was the German, Friedrich List, who, while an exile in the United States, became imbued with protectionist ideas, and after doing substantial service for them in the country of his adoption, returned to Germany to do battle for them there. He published his National System of Political Economy in Germany in the year 1841. It had great and immediate success, and has exercised a wide influence in Europe on theoretical discussion as well as on practical politics. List, like Hamilton, looked on protection as a temporary system designed to facilitate the passage of a country from an agricultural to a manufacturing state. He accepted free trade as generally and permanently true, but suited for actual adoption only in that cosmopolitan era towards which the world is progressing. But in order to prepare for this cosmopolitan period it is first necessary for each nation to develop its own resources in a complete and harmonious manner. A comprehensive group of national economies is the fundamental condition of a desirable world economy; otherwise there would be a predominance of one or of a few nations, which would of itself constitute an imperfect civilization. Protection is a means of educating a nation, of advancing it from a lower to a higher state. He admits that it may involve a loss, but only in the sense that money expended for an education or an educational system is a loss, or that money spent for seed corn is a loss. To the cosmopolitan system of Adam Smith, List opposes the national system as a preliminary and necessary stage. He favours the imposition of duties as the most efficient means of effecting the protection which he has in mind. Agriculture will be sufficiently protected by the constant demand for its products. The essence of his larger work is contained in a pamphlet published in Philadelphia in 1827, entitled Outlines of American Political Economy. It is, in fact, a series of letters advocating the further development of the protective system already adopted in the United States.

The third great name in the history of protection is that of Henry C. Carey, an American, in some ways the most distinguished and most influential of the followers of Hamilton and List. He was at first a strong free trader, then a protectionist who believed in protection as a preparation for free trade, and finally an uncompromising advocate of protection in all circumstances and for all nations. In him and in Simon M. Patten, the last, and in many respects the ablest, of the apologists for protection, we have the theoretical development corresponding to the practical outcome of protection as a comprehensive all-embracing scheme extending protection to all branches of industry alike—agriculture, manufacturing and mining—and aiming to be permanent in its form and policy. As Patten expresses it: "Protection now changes from a temporary expedient to gain specific ends (such as the establishment of manufactures), to a consistent endeavour to keep society dynamic and progressive. Protection has become part of a fixed national policy to increase the value of labour with the increased productivity of the nation and to encourage the development of knowledge and skill, and in the adjustment of a people to its environment." The object of protection has now become, in the view of the theoretical American protectionist, not an approximation to European industrial conditions, but as a great differentiation from them as possible. Carey's works were translated into the leading European languages, and contributed doubtless to the spread of protectionist ideas, though the extreme form in which his views were expressed, and the rambling illogical method of exposition, repelled many who might otherwise have been attracted by the course of his thought.

Economists of other schools, with the exception of the more rigid British free traders, have allowed a relative validity to the doctrines of List; and even among older British economists, Mill and some of his disciples conceded the logical possibility of quickening the development of an industry by import duties in such a way as to result in more good than harm, though they hardly ever been willing to acknowledge that it is practically possible. The modern historical school of political economists have generally admitted the reasonableness of protective policies at certain times and places, though usually finding the justification in political and social considerations rather than in economic. And while the British objections to protectionism in any form have been widely upheld by the more conservative economists in England, the new political school of "tariff-reform and colonial preference" has found strong support at the hands of such British authorities on economics as Professors Cunningham, Ashley and Hewins, or the authors of Compatriots' Club Essays 1906 (J. L. Garvin and others), whose advocacy of a national policy recalls the work of Hamilton and List. (E. J. J.)

PROTECTOR, a Latin word (formed from protegere, to cover in front) adopted into English. In post-classical Latin the protectores were the body-guards of the emperors, and of the Praetorian prefects until, under Constantine the Great (306-337), they ceased to exercise military functions. The protectores, with the domestici, continued to form the body-guard and household troops of the emperor. They were veterans selected from the legions, and were capable of being appointed to high commands. In the Roman curia the protectores regnum are cardinals who take charge of the affairs of the province to which they are named which come before the Sacred College, and to present them for consideration. In England “protector” was used first for the regent during a minority (e.g. the Protector Somerset, and then by Edward VI when he assumed the government in 1547.) The name thus acquired a revolutionary significance, and has not since been officially used in England. In Spanish America the bishops were officially protectors of the Indians. The title is convenient for a ruler who wishes to exercise control outside the limits of his direct sovereignty. Thus Napoleon called himself protector of the Confederation of the Rhine. The kings of France, and the governments which have arisen out of the Revolution, were protectors of the Latin Christians in the Turkish Empire, while the tsars of Russia have claimed the same position towards the Orthodox Christians.

PROTECTORATE, in international law, now a common term to describe the relation between two states, one of which exercises control, great or small, direct or indirect, over the other. It is significant of the rare use of the term until recent times that the word does not occur in Sir C. G. Lewis’s book on The Government of Dependencies. Yet the relation is very ancient. There have always been states which dominated their neighbours, but which did not think fit to annex them formally. It has always been politic for powerful states to facilitate and hide schemes of agrandizement under euphemistic expressions; to cloak subjection or dependence by describing it in words inoffensive or strictly applicable to other relations. A common problem has been how to reduce a state to submission or subordination while ostensibly preserving its independence or existence; to obtain power while escaping responsibility and the expenditure attending the establishment of a regular administration. Engelhardt (Les Protectorats anciens et modernes) and other writers on the subject have collected a large number of instances in antiquity in which a true protectorate existed, even though the name was not used. Thus the Hegemony of Athens as it existed about 467 B.C., was a form of protectorate; though the subject states were termed allies, the so-called “allies” in all important legal matters had to resort to Athens (Meyer, Geschichte des Alterthums, vol. iii. § 274).

In dealing with dependent nations Rome used terms which veiled subjection (Gairal, Les Protectorats internationaux, p. 24). Thus the relationship of subject or dependent cities to the dominant power was described as that of clients to the patronus (Marquardt, Römische Staatsverwaltung, 2nd ed., vol. i. p. 86). Such cities might also be described as civitates foederatae or civitates liberae. Another expression of the same fact was that the cities had the power of the Roman people; in dedication or in foedem populii romanii venire (Marquardt, Römische Staatsverwaltung, i. 73, 81). The kingdoms of Numidia, Macedonia, Syria and Pergamum were examples of protected states, their rulers being termed inservientes.

The Romans drew a distinction between foedera aequa and foedera iniqua. The latter created a form of protectorate. But the protected state remained free. This is explained in a passage of the Digest 49.15,7: “Liber autem populus est, qui nullius alterius populi potestati est subjectus, sive is foedertas est; item sive aequo foedere in amicitiam venit, sive foedere comprehendendum est, ut populus alterius populi majestatem comitter conservaret. Hoc enim adnuntiat, ut intelligatur alterum populum superiorem esse: non ut intelligatur alterum non esse liberum” (Marquardt, Römische Staatsverwaltung, 2nd ed., vol. i. p. 46, Mommsen, Römisches Staatsrecht, vol. iii. pt. 1, p. 645, and the instances collected by Pfundorff, 8 c. 9, 4).

In medieval times this relation existed, and the term “protection” was in use. But the relation of subordination of one state to another was generally expressed in terms of feudal law. One state was deemed the vassal of another; the ruler of one did homage to the ruler of another. In his book De la République Bodin treats of cases of which there are cases in protection (t. c. 7), or, as the Latin text has it, de patrocinio et clientela. In Bodin’s view, such states retain their sovereignty (t. c. 8). Discussing the question whether a prince who becomes a clients of another loses his majestas, he concludes that, unlike the true vassal, the clients is not deprived of sovereignty: “Nihominum in foedere et pacis actionibus, quae inter principes aut populos societate et amicitia conjunctissimae sanctentur; eam viam habet, ut nec alter alteri parent, nec imperet: sed ut alter alterius majestatem observaret, sine illa majestatis minutione teneatur. Itaque jus illud clientelare seu protectionis omnium maximum ac pulcherrimum inter principes censetur” (t. c. 7). Elsewhere Bodin remarks, “le mot de protection est special et n’emporte aucune subjection de celui qui est en protection.” He distinguishes the relation of seigneur and vassal from that of protecteur and adherent. As to whether the protected state or prince is sovereign, he remarks, “je tiens qu’il demeure soverain, que le subjection n’est que l’obligation de l’officier de la protection par adding “l’advoué ou adherent doit etre exempte de la puissance du protecteur s’il contrevient aux traites de protection. Voila donc la plus grande seureté de la protection, c’est empescher s’il est possible que les protecteurs ne soient saisis des fortesses” (p. 549, ed. 1580). Sometimes letters of protection were granted by a prince to a weak state, as e.g. by Louis XIII. in 1641 to the prince of Monaco (Gairal, p. 81).

Reverting to the distinction in Roman law, Grotius and Pfundorf, with many others, treat protection as an instance of unequal treaties; that is, “when either the promises are unequal, or when either of the parties is obliged to harder conditions” (De jure Belli et Pacis, t. c. 13, 27; De jure naturae, 8 c. 9).

The following are some definitions of “protectorate”: “Principis privilegium, quo ne aliucius vis inferatur, cavetur, eumque in protectionem suscipit.” Du Cange: “La situation d’un état à l’égard d’un autre moins puissant auquel il a promis son appui d’une manière permanente” (Gairal, vol. i. p. 52); a definition applicable only to certain simple forms of this relation. “Pour le protégé, une condition de souveraineté substituée à la pleine indépendance que comporte le régime de l’appréhension, c’est la protection, ou la subsistance de pouvoirs dynastiques ou de ouverture de puissance inégale, dont l’accord de protection permanent de défense l’autre, et en outre de le diriger” (p. 52). “Unter einem Protectorat verstehet man ein Schutzverhältniss zwischen dem Staate, dessen Befolgung nicht der Staatsfreiheit oder schutzherrliche Staat, zum dauernden Schutze des anderen Staates—des Schutzaates oder Unterstützaates—verpflichtet ist; worin ihn ein mehr oder weniger weitgehender Einfluss auf die ausgezeichneten Angelegenheiten desselben und theilweise auch auf dessen innere Verhältnisse eingeraumt ist” (von Stengel, Die deutschen Schutzgebiete, 11). “Das Verhältniss von zwei (oder mehreren) Staaten, das in materieller Beziehung auf dem dauernden Bedürfnis des Schutzgebietes durch einen stärkeren beruht” (Ullmann, s. 26).

The one common element in Protectorates is the prohibition of all foreign relations except those permitted by the protecting state. At this idea of a protectorate excludes, and the idea of annexation, on the other hand, would include, it that absolute ownership which was signified by the word dominium in Roman law, and which, though not quite satisfactorily, is sometimes described as ‘territorial sovereignty.’ The protected country remains, in regard to the protecting state, a foreign country; and
this being so, the inhabitants of the protectorate, whether native-born or immigrant settlers, do not by virtue of the relationship between the protected and the protectorate become subjects of the protecting state (Lord Justice Kennedy, Rex v. Crewe, 1940). It is difficult to distinguish a protectorate or people, whether civilized or uncivilized, is that it cannot maintain political intercourse with foreign powers except through or by permission of the protecting state (Hall, Foreign Jurisdiction of the British Crown, p. 108). It is not within the power of the British protectorate, or any other state, to obtain the right of conquest without the consent of those living thereon. It is also used as the term "suzerainty." As appears from the article SUZERAINITY, the terms are distinguishable. But both imply a desire to carry out changes without friction and not to break up ancient forms; both proceed on the same general plan of securing to the stronger state the substance of power, while allowing the weaker state a semblance of its old constitution. It is a form of empire or state building which appears when a powerful, expanding state comes in contact with feeble political organization and with a desire for political union. The creation of a protectorate is convenient for the superior and the inferior; it relieves the former from the full responsibilities incident to annexation; it spares to some extent the feelings of the latter.

Certain protectorates originate in treaties; others have been imposed by force. Some are accompanied by occupation, in which case it is difficult to distinguish them from annexation. Thus the treaty of May 1881, art. 2, between France and Tunis, provides for the occupation of strategical points by the protecting state (A. Devaux, Les Protectorats de la France, p. 21).

The establishment of a protectorate may be akin to a guarantee. Generally, however, the former implies a closer relation than a guarantee; and the two relations may be widely different, as may be seen by comparing treaties of guarantee with the treaty establishing the protectorate of Tunis.

Strictly speaking, a protectorate cannot exist over a domain uninhabited or ruled by no organized state; in such cases the elements of the true protectorates are wanting. But the distinction is not adhered to. The difficulty of defining the relations between the protected and the protecting states is greater, because a protectorate may imply a condition of transition: a contractual or limited relation of state to state, more or less rapidly changing into true union.

It is the policy of the British government in India to establish on the frontier, as elsewhere, protectorates. The political advantages of the system are pointed out in Sir A. Lyall's Rise and Extension of the British Dominions in India. It is a system "whereby the great conquering or commercial peoples masked, so to speak, their irresistible advance;" it was much practised by the Romans in Africa and Asia; it has been chiefly applied in modern times in India (p. 326).

The Indian states are sometimes described as "Feudatory States," sometimes "Independent and Protected States," (Twiss), sometimes "Mediatized States" (Chesney), sometimes "Half-Sovereign," sometimes as in a position of "subordinate alliance" (Lord Salisbury, Parliamentary Papers, 1897 [c. 8700], § 27). The Interpretation Act, 1889 (52 & 53 Vic. c. 63, s. 18), refers to the Indian native princes as under the "suzerainty" of the British Crown. These states are really sui generis, and their precise position can be understood only by a private examination of the treaties affecting them. The following are the chief points as to which Indian states are subject to British influence: (1) the government in general is empowered to make laws for servants of the British government and European and native Indian subjects of his majesty; (2) British laws are in force in certain parts of the native states, e.g. in cantonments; (3) native princes have adopted certain British laws, e.g. the Indian Penal Code; (4) they have no external relations with foreign states; (5) the king is the donor of honours; (6) acts of parliament affect them indirectly by directly affecting the British agent; (7) they receive advice, which may be akin to commands. (See also Lubbet's Government of India, 2nd ed. p. 140).

Among the chief British protectorates are: (1) the African groups, consisting of the western group—Gambia; Sierra Leone; Ashanti (northern territory); Northern Nigeria; Southern Nigeria (with which is amalgamated Lagos). The southern group—Bechuanaland; South Africa; Natal; the Northwest territorial states of Nyasaland, Rhodesia and North-west Rhodesia; Nyasaland. The eastern group—British East Africa; Uganda; Zanzibar and Pemba (sometimes described as "a sphere of influence"); Somaliland; and the Sudan.

There are also the Bahrein Islands in the Persian Gulf. Jurisdiction over these protectorates, generally speaking, exercised under orders in council made under the Foreign Jurisdiction Act, 1863, and Foreign Law, 2nd ed. 1820. There is also the Malay group, consisting of the Malay States in the Borneo peninsula and in Borneo, the protectorates of North Borneo, Brunei and Sarawak. Protectorates also exist in the Western Pacific group of islands (the Friendly Islands, the Ellice and Gilbert group, and the British Solomon Islands).

There is the interesting case of Papua (formerly British New Guinea), over which a protectorate was established in 1884, but which became in 1906 a territory of the Australian Commonwealth. There are also dependencies, or protectorates, attached to India, Baluchistan, Sikkim and Andaman Islands.

France possesses several protectorates, of which the chief are those of Madagascar, the Cameroons, the Ashanti, the Dahomey, and the Congo. It has been until lately to transform them into French territory. Such change has taken place as to Tahiti and Madagascar, and such in effect is the position of the Indo-China protectorates (Devaux, Les Protectorats de l'Inde et de la Chine, 1897; Report by Mr. Lister, 1890, p. 311). Russia has the protectorates of Khiva and Bokhara; and China exercises or claims rights as protector of certain dependencies.

There are two principal classes of protectorates; the first being those exercised generally by treaty over civilized countries. Of the first, the chief are: (a) that of Cracow, which was recognized by the Treaty of Vienna as an independent state, and placed under the protection of Russia; it was incorporated with Austria in 1846; (b) Andorra, protected by Spain and France as successors of the counts of Foix (see ANDORRA); (c) the Ionian Islands, placed under the protection of Great Britain by the Treaty of Paris of 1815.

The second class of protectorates consists of those exercised by one civilized state over an uncivilized people, sometimes called a "Colonial Protectorate" or "pseudo-protectorate," and usually the preparatory step to annexation. These were the protectorates established in Africa, since 1878. The second class may be subdivided into groups: (a) protectorates exercised over states with organized governments and under recognized sovereigns, such as the Malay States; and (b) those exercised over countries possessing no stable or definite governments and rulers. The territories of chartered companies, when not within the dominion of the protecting state, may also for some purposes be regarded as protectorates.

Attempts have been made to define the reciprocal rights and duties of protecting and protected states. Sometimes the treaty creating the relation defines the obligations. Thus in the treaty with respect to Sarawak, the latter is described as an "independent state under the protection of Great Britain." Such protection shall confer no right on his Majesty's government to interfere with the internal administration of that state further than is herein provided. The British consular officers are to receive equities in the courts of the protectorate, if the government relations are to be conducted by that government, and the raja cannot cede or alienate any part of the territory without the consent of the British government (Hertslet, 18, 227). In the treaty creating a protectorate over the territories of the king and chief of Opobo (Hertslet, 17, 130) the sovereign undertakes to extend to them, and to the territory under their authority and jurisdiction, his favour and protection. They promise not to
enter into "any correspondence, agreement or treaty with any foreign nation, or power, except with the knowledge and sanction of His Majesty's government." Some treaties establishing protectorates provide for direct interference with internal affairs; for example, the treaty of 1847 creating a French protectorate over Tahiti, and that of 1883 as to Tunis. Sometimes the Oberstaat—to use a convenient expression—is content to insist upon the presence of a resident, who guides the policy of the native ruler. In the case of protectorates over uncivilized countries it is usual to stipulate against alienation of territory without consent of the Oberstaat.

The legal position of protectorates is still somewhat undefined; there are an old view and a new view of their nature. The relation may be one of international law, two states having entered into obligations by treaty. Or the relation may be one of public law; one of two states has become subordinate to, and incorporated with, the other. The general rule is that the protected state does not cease to be a sovereign state, if such was its previous status. Its head is still entitled to the immunities and dignity of a sovereign ruler. Further, the establishment of a protectorate does not necessarily rescind treaties made between the protected state and other states, at all events when it is not in reality conquest or cession, or when any modification would be to the injury of third parties (Port. Papers, Madagascar, 1897 [c. 8700]; Trione, 187). Nor does the new relation make any change as to the nationality of the subjects of the two states, though in some countries facilities are afforded to the subjects of the Unterstaat to transfer their allegiance; and they owe a certain ill-defined degree of obedience to the protecting state. Nor, speaking generally, does the territory of the protected state become part of the territory of the Oberstaat; in this respect it is unlike a colony, which may be regarded as an extension of the right of the ruler of the Oberstaat. At the same time, the question whether a particular protectorate forms part of the "dominion" or "territory" of the Crown for any purposes or within the meaning of any statute cannot be regarded as wholly free from doubt; its terms and intention must be examined. In Rex v. Crewe (1910, 79, L. J. 874) the Court of Appeal decided that the Bechuanaland Protectorate was not part of the territory of the Crown, but was foreign territory. Several writers propose this distinction— the protected country is to be considered a part of the territory as to certain important sovereign rights, and as to other matters not. In one view, for the purpose of municipal law, the territory of a protectorate is not, but for the purposes of international law is, within the territory of the protecting state. In another view, such territory is foreign only in the sense that it is not within the purview of the majority of statutes (see Hall's International Law, 6th ed., 126; Heilborn, 535; Tupper's Indian Protectorates, 356; Laband, 2, § 79).

The older view of the position of a protectorate according to international law is contained in the decision of Dr Lushington in the case of the Leucade (8 S.T., N.S., 432), to the effect that, the treaty of 1824 by which Greece, against the standing, the Ionian Islands, which were then under the protectorate of Great Britain, remained neutral. The King of Great Britain had the right of declaring peace and war. "Such a right is inseparable from protection. Under it the Government of the state has some degree of control over the civil affairs of the state with which Great Britain was at war. According to one view, the protected state is implicated in the wars of the protecting state as a party only when the latter has acquired a right of military occupation over the territory of the former (British law of war, 1879, 623). In these proposals de la guerre contre l'Allemagne pour les îles Taiti alors soumises à notre protectorat; elle s'imposerait pour la Tunisie, l'Annam et Tonkin, et pour le Cambodge, où les traités nous confèrent le droit d'occupation militaire" (M. Despagnet). In the event of hostilities between the protecting and protected states, such hostilities would be regarded not as of the nature of an insurrection, but as a regular war (Trione, 149).

By the General Act of the Berlin Conference it was agreed that the acquisition of a protectorate should be notified to the signatories to the agreement (art. 34), and it has been the practice to give such notice. It was proposed by some of the powers represented that effective occupation should be a condition to the creation of a protectorate on the coast of Africa. But this was opposed by England, and was not adopted (Laband, 2, 686).

Many writers adhere to the doctrine that there is no impairment of sovereignty of the weaker state by the establishment of a protectorate. They also allege that it is res inter alias acta, an arrangement which concerns only parties to it. But the trend of recent policy and purport of much recent legislation are against this view. The distinct tendency, especially as to protectorates over uncivilized countries, is to treat, for purposes of international law, the territory of a protectorate as if it belonged to the protecting state. If France, for example, permitted in Tunis or other protectorates operations of an unfriendly character to any power, the injured power would no doubt look to France for redress. This view would probably be strongly pressed in the case of protectorates over countries having no well-defined or stable government. The probability is that in such cases governments, and in fact that in the case of nations would probably be guided not by technical facts—such as, to take the case of British possessions, as the fact that an order in council permitted appeals to the Judicial Committee—would look to the facts of the case. "Any state which undertakes to protect another assumes towards the rest of the world responsibility for its good behaviour—the more complete protection the more extensive the responsibility—and this responsibility involves a duty to interfere if need be" (Coolidge, United States as a World Power," p. 157; and to the same effect Liszt, Völkerrecht, p. 31; and Zorn, Völkerrecht, p. 43). The tendency is for protecting states to assert jurisdiction over foreigners within the territories of the protected states (Westlake, 178; Jenkyns, p. 176; Ibert, 2nd ed., 393, 434). Mr Hall remarks (International Law, 6th ed., p. 126 n.) that all the states represented at the Berlin Conference of 1884–1885, with the exception of Great Britain, maintained that the normal jurisdiction of a protectorate was the same as that of another civilizing power over the subjects of other civilized states." The General Act contemplated measures which are scarcely compatible with the exemption of European traders and adventurers from the local civilized jurisdiction. He points out that Great Britain—which until lately took the view that a protected state possesses only delegated powers, and that an Eastern state cannot grant jurisdiction over persons who are neither its own subjects nor subjects of the country to which the powers are delegated—had by the Pacific Order in Council of 1893 and the South African Orders in Council of 1891–1894 asserted jurisdiction over natives and foreign subjects. "The Orders show a gradual increase of the assumption of internal sovereignty" (Jenkyns, 193). A similar process is observable in the German protectorates, which are treated for some purposes as "inland," and not foreign territory (Der Koloniale Inlands- und Auslands-begriff, Zeitschrift für Kolonialrecht, 1997, p. 317). The establishment of protectorates over uncivilized or semi-civilized countries a development is inevitable: control quickly hardens into conquest, and international law more and more takes note of this fact.

PROTEOMYXA—PROTESILAUS

PROTEOMYXA, a name given by E. Ray Lankester (Encyc. Brit., 9th ed., 1885, art. "Protozoa,") to a group of Protozoa Sarodina. The group was really classified as distinct by Cienkowski and by Zopf, receiving the name of Monadinea from

"Monera" of Haeckel, supposed erroneously in most if not all species adequately studied) to possess no nucleus in the protoplasm. The following are the characteristics of the group. Pseudopods usually granular, fine flexible, tapering generally, not freely branching; reproducing sometimes by simple fission, but more frequently by multiple fission in a broad-cyst whose walls may be multiple. Plasmodium formation occasional, but never leading to the formation of a massive fructification: other syngamic processes unknown, and probably non-existent. Encystment, or at least a resting stage at full growth, is very characteristic, and frequently an excrescence of granules takes place into the first-formed cyst, whereupon a second inner cyst is formed which may be followed by a third. These broad-cysts, in which multiple fission takes place, may be of two kinds, ordinary and resting, the latter being distinguished by a firm, and usually ornamented and cuticularized cell-wall, and only producing its zoospores after an interval. Besides, an individual at any age may under unfavourable conditions surround itself with a "hypnocyst," to pass the time until matters are more suitable to active life, when it emerges unchanged.

From the initial character of the broad-cell on leaving the sporocyst the dividing character of the two orders is taken.

2. Azoosporae, Zopf. Genera: Endymena, L.; Vampyrella, Cienk. (figs. 1, 2, 3); Leptophyris, Hertw and Less.; Bursilla, Sorokin; Protogenes, Haeck. (fig. 8); Archinga, L. (figs. 4-7); Serosporidium, L. Pfeiffer; Lymphosporidium, Calkins.

Many of the species are endoparasites in living cells, mostly of Algae or Fungi, but not exclusively. At least two species of *Pseudospora* have been taken for reproductive stages in the history of their hosts—wherein the generic name, *Plasmodiophora brassicae* gives rise to the disease known as "Hanburies" or "fingers and toes" in *Trichoderma*; *Lymphosporidium* causes a virulent epidemic among the American brook-trout, *Salvelinus fontinalis*. *Vampyrella* is remarkable for containing a pair of chlorophyll corpuscles in each cell; no nucleus has been made out, but the chlorophyll bodies divide prior to fission. It is a fresh-water form. The cells of this species form loose aggregates or filopodia, like those of *Mycoporum* (Foraminifers, etc.) or *Laudenia* (Labyrinthulodes, etc.).

(proposed 1879) and Enteromyxa also form a compact plasmodium which separates into 1-nucleate cells, which then encyst and divide into a broad of four.

PROTESILAUS, in Greek legend, son of Iphicus, and husband of Laodameia. In command of the Greek contingent from Phthia at any rate, he was the first to take together on Trojan soil, although he knew it meant instant death. His wife besought the gods below that he might be permitted to return to earth for the space of three hours. Her prayer was granted, and on the expiration of the time allotted she returned with him to the nether world. According to Hyginus (Fab. 103, 104), Laodameia made a waxen image of her husband. A slave, having detected her in the act of embracing it and supposing it to be a lover, informed her father, who ordered her to burn the image; whereupon she threw herself with it into the flames. In another account (Conon, Narrations, 13) Protesilaus survived the fall of Troy and carried off Aethilia, the sister of Priam. During a halt on the peninsula of Pallene, Aethilia and the other captive women set fire to the ships. Protesilaus, unable to continue his voyage, remained and built the city of Scione. His tomb and temple were to be seen near Eleusis in the Thracian Chersonese. Theaks had planted elm-trees, facing towards Troy, which withered away as soon as they had grown high enough to see the captured city. Protesilaus was the subject of a tragedy by Euripides, of which some fragments remain.

Iliad, ii. 698; Lucian, Dial mor. xxiii. 1; Ovid, Heroides, xiii.; Philostorus, Heroica, iii.
PROTESTANT, the generic name for an adherent of those Churches which base their teaching on the principles of the Reformation (q.v.). The name is derived from the formal Protestantism handed in by the evangelical states of the empire, including some of the more important princes and 14 imperial cities, against the recess of the diet of Spires (1529), which decreed that the religious status quo was to be preserved, that no innovations were to be introduced in those states which had not hitherto made them, and that the mass was everywhere to be tolerated. The name Protestant seems to have been first applied to the protesting princes by their opponents, and it soon came to be used indiscriminately of all the adherents of the reformed religion. Its use appears to have spread more rapidly outside Germany than in Germany itself, one cause of its popularity being that it was negative and colourless, and could thus be applied by adherents of the “old religion” to those of the “new religion” without giving offence, on occasions when it was expedient to avoid abusive language. The designation was moreover grateful to the Reformers as connoting a certain boldness of attitude; and Professor Kattenbusch (Herzog-Hauck, Realencyklopädie, 3rd ed., xvi. p. 136, 15) points out with great truth how, from this point of view, the name “Protestantism” has survived as embodying for many the concept of liberty, of the right of private judgment, of toleration for every progressive idea in religion, as opposed to the Roman Catholic principles of authority and tradition; so that many even of those who do not “ profess and call themselves Christians” yet glory in the name of “Protestant.”

As the designation of a Church, “Protestant” was unknown during the Reformation period and for a long while after. In Germany the Reformers called themselves usually evangelici, and avoided special designations for their communities, which they conceived only as part of the true Catholic Church; “Calvinists,” “Lutherans,” “Zwinglians” were, in the main, terms of abuse intended to stamp them as followers of one or other heretical leader, like Arians or Hussites. It was not until the period of the Thirty Years’ War that the two main schools of the reformed or evangelical Churches marked their definitive separation: the Calvinists describing themselves as the “Reformed Church,” the Lutherans as the “Lutheran Church.” In France, in England, in Holland the evangelicals continued to describe their churches as ecclesiae reformatae, without the arrière pense which in Germany had confined the designation “Reformed” to the followers of a particular church order and doctrine. As to the word “Protestant,” it was never applied to the Church of England or to any other, so unfavourably and in the wide sense above indicated, until the style “Protestant Episcopal Church” (see below) was assumed by the Anglican communion in the United States. Even in the Bill of Rights the phrase “Protestant religion” occurs, but not “Protestant Church,” and it was reserved for the Liberal government, in the original draft (afterwards changed) of the Accession Declaration Bill introduced in 1910, to suggest “Protestant Reformed Church of England” as a new title for the Established Church.

The style “Protestant” had, however, during the 19th century assumed a variety of new shades of meaning which necessarily made its particular application somewhat hazardous proceeding. In Germany it had, for a while, been assumed by the Lutherans as against the Calvinists, and when in 1817 King Frederick William III. of Prussia forcibly amalgamated the Lutheran and Reformed Churches in the new “Evangelical Church” its public use was forbidden in the Prussian dominions. It survived, however, in spite of royal decrees, but in an altered sense. It became—to quote Professor Kattenbusch—the “secular” designation of the adherents of the Reformation, the shibboleth of the “liberal” ecclesiastical and theological tendencies. Finally, in opposition to the ultramontane movement in the Roman Catholic Church, it came once more into fashion in something of its original sense among the evangelicals. In the Church of England, on the other hand, the name “Protestant” has, under the influence of the High Church reaction, been repudiated by an increasingly large number of the clergy and laity, and is even sometimes used by them in a derogatory sense as applied to their fellow churchmen who still uphold in their integrity the principles of the Reformation. Among the latter, on the other hand, “Protestantism” is used as exclusive of a good many of the doctrines and practices which in the Lutheran Church were at one time “Protestant” as opposed to “Reformed,” e.g. the doctrine of the True Presence, auricular confession, the use of ceremonial lights and vestments. By many churchmen, too, the name of “Protestant” is accepted in what they take to be the old sense as implying repudiation of the claims of Rome, but as not necessarily involving a denial of “Catholic” doctrine or any confusion of the Church of England with non-episcopal churches at home or abroad. In contradistinction to all these somewhat refined meanings, the term “Protestant” is in common parlance applied to all Christians who do not belong to the Roman Catholic Church, or to one or other of the ancient Churches of the East.

PROTESTANTVENERIN is the name of a society in Germany the general object of which is to promote the union (Verein) and progress of the various established Protestant Churches of the country in harmony with the advance of culture and on the basis of Christianity. It was founded at Frankfort-on-the-Main in 1863 by a number of distinguished clergymen and laymen of liberal tendencies, representing the freer parties of the Lutheran and Reformed Churches of the various German states, amongst whom were the statesmen Bluntschli and Von Bennigsen and the professors R. Rothe, H. Ewald, D. Schenk, A. Hilgenfeld and F. Hitzig. The more special objects of the association are the following: the development of the Churches on the basis of a representative parochial and synodal system of government in which the laity shall enjoy their full rights; the promotion of a federation of all the Churches in one national Church; resistance to all hierarchical tendencies both within and without the Protestant Churches; the promotion of Christian toleration and mutual respect amongst the various confessions; the rousing and nurture of the Christian life and of all Christian works necessary for the moral strength and prosperity of the nation. These objects include opposition to the claims of Rome and to autocratic interference with the Church on the part of either political or ecclesiastical authorities, efforts to induce the laity to claim and exercise their privileges as members of the Church, the assertion of the right of the clergy, laity and both lay and clerical professors to search for and proclaim freely the truth in independence of the creeds and the letter of Scripture. Membership in the association is open to all Germans who are Confessing Christians (i.e. Lutherans, Reformed, etc.) and declare their faith unchangeably and accept the objects of the association. The means used to promote these objects are mainly (1) the formation of local branch associations throughout the country, the duty of which is by lectures, meetings and the distribution of suitable literature to make known and advocate its principles, and (2) the holding of great annual or biennial meetings of the whole association, at which its objects and principles are expounded and applied to the circumstances of the Church at the moment. The “theses” accepted by the general meetings of the association as the result of the discussions on the papers read indicate the theological position of its members. The following may serve as illustrations:—

The creeds of the Protestant Church shut the doors on the past only, but open them for advance in the future; it is immoral and contrary to true Protestantism to require subscription to them. The limits of the freedom of teaching are not prescribed by the letter of Scripture, but a fundamental requirement of Protestantism is free inquiry in and about the Scriptures. The attempt to limit the freedom of theological research is entirely opposed to the principle of the Bible must justify itself before its tribunal; we find the history of divine revelation and its fulfilment in the Bible alone, and reason bids us regard the Bible as the only authority and canon in matters of religious belief.

The formation of the association at once provoked fierce and determined opposition on the part of the orthodox sections
PROTESTANT EPISCOPAL CHURCH

of the Church, particularly in Berlin. Attempts more or less successful have been made from the first to exclude clergymen and professors identified with it from the pulpits and chairs of Berlin and elsewhere, though membership in it involves no legal disqualification for either. One of the objects of the association was to some extent obtained by their organization of the Prussian Church when Dr Falk was cultus minister, on the basis of parochial and synodal representation, which came into full operation in 1879. But the election for the general synod turned out very unfavourable to the liberal party, and the large orthodox majority endeavoured to use their power against the principles and the members of the association. In 1882 the position of the association was rendered still more difficult by the agitation in Berlin of Dr Kalthoff and other members of it in favour of a “people’s church” on purely dissenting and extremely advanced theological principles. This difficulty has continued, and the extreme rationalist position taken up by some leaders has alienated the sympathy not only of the obscurantists but of those who were prepared to go some distance in the direction of a liberal theology. There are now about 25,000 members in the 20 branches of the Verein.

See D. Schenkke, Der deutsche Protestantismus und seine Bedeutung für die Gegenwart (Wiesbaden, 1866, 2nd ed. 1871); Der deutsche Protestantismus und seine Bedeutung für die Gegenwart, 3rd ed. (Berlin, 1870); W. Welker, Eingliederung der protestantischen Kirchengebiete in die katholischen Kirchen von Deutschland (Wien, 1874); P. Wehnhorn in Herzog-Hauck’s Realencyc. für prot. Theol. u. Kirche; H. Weinel, “Religious Life and Thought in Germany To-Day,” Hilbert Journal (July 1900).

PROTESTANT EPISCOPAL CHURCH, in the United States, a part of the Anglican Communion, organized after the War of Independence by the scattered parishes of the Church of England which survived the war. It inherits from the Church of England, with which it is in communion, its liturgical and spiritual traditions, though it has entire independence in legislation. While the clergy of both Churches are cordially received in their respective countries, there is no formal connexion between them except in fellowship and in advisory council as at the Lambeth Conference. The Church in the United States is therefore an independent national Church which has adapted itself to the conditions of American life.

With many likenesses, the Protestant Episcopal Church is different from the Church of England in its organization and representative form of government. It has the three orders of bishops, priests and deacons, and uses an almost identical liturgy; but it is a democratic institution in which the laity have practically as much power as the clergy, and they are represented in all legislative bodies. The Church follows, in many particulars, the constitution of the United States. As the separate states of the Union are made up of different townships, so the diocese is composed of separate parishes; and as the nation is a union of the states, so the Church is a union of the dioceses. The American plan of representative government is consistently adhered to. The Church in America is thus a part of the Catholic Church of Christ, with its roots deep in the past and yet a living body with a life of its own, standing for the truth of the Christian religion in the great Republic. It is firmly established in every state and Territory of the United States, and in all the dependencies, with also vigorous missions in foreign lands.

Services of the Church of England were held by the chaplains of exploring expeditions in various parts of North America before a settlement was established: on Hudson Bay, in 1578, and on the shores of the Pacific with Drake in 1579; but the first permanent foothold of the Church was in Jamestown, Virginia, in 1607, when a colony was founded and a church built. This fact is recognized in the proposed preamble to the constitution, in which it is stated that this American Church was “first planted in Virginia in the year of Our Lord 1607, by representatives of the ancient Church of England.” Parishes were later founded in Maryland in 1676; in Massachusetts in 1686; in New York about 1693; in Connecticut in 1706; and in the other colonies during the 17th and 18th centuries. The growth of these colonial churches was largely promoted by the Society for the Propagation of the Gospel in Foreign Parts, founded in 1701, through the efforts of the Rev. Thomas Bray, a missionary in Maryland. These churches scattered throughout the different colonies up to the American War of Independence were missions of the Church of England. They were under the jurisdiction of the Bishop of London, there being no bishop in America. The Bishop of London superintended these distant parishes by means of commissaries. Many of the clergy came from England; and when young men in America desired to be ordained, it was necessary for them to go to England for this purpose. The Church during the colonial period was incomplete in organization, and without the power of expansion. It was confined principally to the more settled parts of the country, though it had extended itself into all the colonies. During this period a few educational institutions were founded: the College of William and Mary in 1693, in Virginia; the Public Academy of Philadelphia, in 1749, now the university of Pennsylvania; and King’s College, in 1754, in New York, now Columbia University. The clergy also frequently taught in parochial schools, and trained boys and girls in their homes.

When the war broke out and independence was declared, a number of the clergy went back to England, leaving their parishes vacant, but many, especially in the southern states, remained and upheld the American cause. A large majority of the laymen were patriots. Two-thirds of the signers of the Declaration of Independence were Episcopalians. The churches, having their support largely withdrawn by the Venerable Society, became very weak. In Massachusetts during the war only two churches were kept open.

After the war it was very soon recognized that if the Church was to survive, there must be organization and co-operation among the fragments. Rev. William White (1748-1836) of Philadelphia, who had been chaplain of the Continental Congress, was a leader in the plan of organization. Rev. Samuel Seabury (1720-1796) of Connecticut was also an important factor in continuing the life of the Church. He was elected bishop by the clergy of Connecticut, and after being refused in England, was consecrated bishop of Connecticut by the Scotch non-juror bishops in Aberdeen on the 14th of November 1784.

Later, William White of Pennsylvania and Samuel Provoost (1742-1815) of New York were consecrated bishops in the chapel at Lambeth Palace on the 4th of February 1787, by the archbishops of Canterbury and York and others. Rev. James Madison (1740-1812) of Virginia was also consecrated bishop in England, on the 15th of September 1790. An important meeting of representatives of the colonial dioceses was held in 1784, and another in 1785, for the purpose of consolidating and uniting the Church. Certain fundamental principles were adopted which were the basis of organization: that the Episcopal Church be independent of all foreign authority; that it have full and exclusive power to regulate the concerns of its own communion; that the doctrines be maintained as in the Church of England; that bishops, priests and deacons be required; that the canons and laws be made by a more representative body of clergy and laity conjointly. At the general convention of 1789 a constitution and canons were finally adopted, and the book of Common Prayer was set forth.

The Church thus being fully organized, it was prepared to develop and extend. There was a long period, however, when little was done save retain what had already been gained. Owing in a measure to the popular prejudice against anything that savoured of England, and to the difficulty of adapting the newly formed institution to the conditions of American life, the Church hardly held its own from 1789 to 1811. The general convention of 1811 was attended by only five clergymen and four laymen more than that of 1789. The Church in Virginia especially suffered a decline, but in the North it maintained itself. After 1811 a new spirit manifested itself in the consecration of three important men to the episcopate. John Henry Hobart, a man of great zeal and devotion, became bishop of New York in 1811; Alexander Viets Griswold (1766-1843), a man of piety and force, became bishop of the eastern diocese of New England in 1811; and Richard Channing Moore (1762-1841), a
strong preacher and vigorous personality, was consecrated bishop of Virginia in 1814. Both Hobart and Moore became interested in theological education; and their efforts to train clergymen resulted in the establishment of the General Theological Seminary in New York in 1816, and the Theological Seminary in Virginia, opened in Alexandria in 1824. The Churchman's Magazine was started. Another evidence of expansion was the consecration in 1819 of Philander Chase (1775-1852), who became pioneer bishop of the West, first in Ohio where he laid the foundations (1824) of the "Theological Seminary of the Protestant Episcopal Church in the Diocese of Ohio," afterward called Kenyon College, at Gambier, and then in Illinois where he organized a church and founded Jubilee College. The Domestic and Foreign Missionary Society was started in 1822. This centralized the mission work, and became the great agency in the growth and extension of the Church. Bishop Jackson Kemper (1789-1870) in the North-west, and Bishop James Hervey Otey (1800-1863) in the South-west, did important pioneer work.

The period between 1835 and 1865 was characterized by further expansion of the episcopate and the formation of new dioceses. Bishop William Ingraham Kip (1811-1893) went to the miners of California in 1853. The dioceses of Oregon and Iowa were founded in 1854; and Bishop Henry Benjamin Whipple (1822-1901) was sent to Minnesota in 1859. The Church found its way into Indiana, Texas, Arkansas, Florida, Nebraska and Colorado. In 1835 there were 763 clergymen; in 1863 there were 1,091; and in 1865 there were 2,450. The number of communicants also grew from 1835, when there were 36,000; to 1850, when there were 50,000; and to 1865, when there were 150,000. During this period some beautiful church buildings were erected, notably Trinity church and Grace church, New York. The services were richer; stained glass was used; stalls for the clergy and choir were introduced, and the lectern was substituted for the old-time reading-desk. Other educational institutions were founded: Nashotah, Wisconsin, in 1842; Bexley Hall at Gambier in 1839; Racine College, at Racine, Wisconsin; and Griswold College in Iowa.

When the Civil War broke out in 1861 the Church in the South met and formed a separate organization called "The Protestant Episcopal Church in the Confederate States," but the Church in the North continued to meet in General Convention. In 1862, when the general convention in New York in 1862, the roll of the Southern dioceses was called, and though absent, they were still considered a part of the Church in the United States. This brotherliness was an important factor in bringing about a complete union between the Northern and Southern Churches after the Civil War; so the Church in the Confederate States had but a temporary existence.

Since the Civil War the Church has grown with the expansion of national life. It has become strong in great centres, and has reached out into every part of the United States and its dependencies, and has maintained missionary stations in foreign lands. There are bishops and missionary dioceses in Alaska, Hawaii, the Philippine Islands, Porto Rico and Cuba; two bishops in China and two in Japan; and bishops in Liberia, Haiti, and Brazil.

Institutions of learning, schools, colleges and theological seminaries have sprung up among the schools are St Paul's, at Concord, New Hampshire; St Mark's, at Southboro, Massachusetts; Groton School, at Groton, Massachusetts; St Mary's, at Garden City, Long Island; St Agnes's, at Albany, New York; St Mark's, at Burlington, New Jersey; St Mary's College, at zipper; D.C.; and St. George's School, at Newport, Rhode Island. In addition to the colleges already referred to, there should be included: Trinity College, at Hartford, Connecticut; St Stephen's, at Alexandria, Virginia; the University of the South, at Sewanee, Tennessee; and Hobart College, at Geneva, New York. The theological seminaries, besides the general seminary in New York and the Virginia Seminary, are: the Divinity School, in Philadelphia; the Divinity School of the University of the South, Sewanee, Tennessee; and the Divinity School of the University of Chicago, at Chicago. Western Theological Seminary, in Chicago: Nashotah House, at Nashotah, Wisconsin; Bexley Hall, at Gambier, Ohio; the Church Divinity School of the Pacific, San Mateo, California; and the Episcopal Theological School in Cambridge, Massachusetts.

Cathedrals have been built or were in process of construction in 1910 in many cities. Among them are: All Saints Cathedral, Milwaukee; the Cathedral of All Saints, Albany; the Cathedral of Incarnation, Garden City, Long Island; the Cathedral of St Luke, Portland, Maine; St John the Divine, New York; and also those in Dallas, Texas, Washington, D.C., Davenport, Iowa, and Cleveland, Ohio. The institutional life of the Church is constantly increasing. Among the numerous organizations founded for distinct purposes are: the Woman's Auxiliary to the Board of Missions; the American Church Building Fund Commission; the American Church Missionary Society; the General Clergy Relief Fund; the American Mission Committee; the American Church Institute for Negroes; the Brotherhood of St Andrew; the Girls' Friendly Society; the Church Students' Missionary Association; the Church Laymen's Union; the Seabury Academy; New York; and the Free Church Manpower Committee of Church Workers among the Colored People; the Society for the Increase of the Ministry; the Church Association for the Advancement of the Interests of Labor; the Church Temperance Society; the Church Unity Society; the Confraternity of the Blessed Sacrament; the Guild of the Holy Cross; the Guild of St Barnabas for Nurses; the Church Congress in the United States. In addition there are Sunday School commissions and institutes in almost every diocese. Among the religious orders may be mentioned the Society of Mission Priests of St John the Evangelist; the Order of the Holy Cross; the Community of St Mary; the Sisterhood of St Margaret; the All Saints Sisters of the Poor; the Sisterhood of St Elizabeth and the Sisters of St Joseph.

The Protestant Episcopal Church in the United States is governed according to the constitutions and canons adopted in 1878, and from time to time amended by the General Convention, which meets every three years. The General Convention consists of the House of Bishops, having as members all the bishops of the Church, and a House of Deputies, composed of four presbyters and four laymen elected by each diocese in union with the Convention; also one clerical and one lay deputy from each missionary district within the boundaries of the United States, and one clerical and one lay deputy chosen by the Convocation of the American Churches in Europe. The voting is by both houses acting separately and concurring. In the House of Deputies the vote is taken by orders, the clerical and lay deputies voting separately; and they must concur for a resolution to pass. This representative body legislates for the whole Church. Each diocese also has its own constitution and canons, by which it regulates its internal affairs, having also an annual diocesan convention, in which the clergy and laity are represented. A bishop is elected by the diocese, subject to confirmation by a majority of the bishops and standing committees of the different dioceses. Missionary bishops are elected by the House of Bishops and confirmed by the House of Deputies if the General Convention is in session; if not in session, by a majority of the standing committees. The presiding bishop of the Church was the senior bishop in order of consecration, until 1910, when an amendment to the constitution was adopted providing for his election by the General Convention for a term of six years. As a result of the amendment, the power of election of the Church is the power given to the laymen. In the parishes they elect their own clergyman; and they have votes in the diocesan convention and in the General Convention, and are thus an integral part of the legislative machinery of the Church.

The worship of the Church is conducted in accordance with the Book of Common Prayer, set forth in 1789, but changed from time to time as need has arisen. The preface states that "this Church is far from intending to depart from the Church of England in any essential part of doctrine, discipline or worship, or further than local circumstances require." This principle guided the Church in the early days, and continues in force. However, changes have been made in the direction of omission of ceremonies and services, and liberalizing of the rubrics, with the object of reference to the king and royal family. The Communion Service has been dropped. In the Te Deum, in place of "Thou didst not abhor the Virgin's womb," is substituted "Thou didst humble Thyself to be born of a Virgin." Many verbal
changes have been made. "Our Father which art in Heaven," is changed to "Whose art in Heaven"; "Then that trespasser" is changed to "Those who trespass." The Ornaments Rubric and the Black Rubric are omitted. The Common Prayer Office is more like the Scottish office, having the Oblation and Invocation. Instead of the Commandments may be said our Lord's summary of the law. Special prayers and thanksgiving have been added, to be used upon several occasions. A form of the consecration of a church has been introduced, as well as an office for the institution of a minister and an office for the visitation of prisoners. The last revision of the American Prayer Book was in 1892; gospels for the Festival of the Transfiguration and for the early celebration of the Holy Communion on Christmas Day and Easter Day were added; and a greater flexibility in the use of the Prayer Book was permitted.

The statistics as reported by the General Convention of 1907 are as follows: the whole number of clergy, 5339; deacons ordained, 483; priests ordained, 471; candidates for holy orders, 461; and a list of lay readers, 2464; baptisms, 197,203; persons confirmed, 158,931; communicants, 87,862; Sunday School officers and teachers, 47,871; pupils, 44,637; parishes and missions, 7615; church edifices, 7028; rectories, 2350; church hospitals, 72; orphan asylums, 57; homes, 84; academic institutions, 22; collegiate, 17; theological, 23; other institutions, 79; total contributions for all purposes, $82,257,519.

Ecclesiastical Institution of the Dioceses, 1587-1883, has been compiled. The book of the diocesan convention is a sort of a history of the diocese, with all the business of the convention and its action in matters ecclesiastical.

PROTEUS—PROTHESIS...

PROTEUS, in Greek mythology, a prophetical old man of the sea. According to Homer, his resting place was the island of Pharos, near the mouth of the Nile; in Virgil his home is the island of Carpathus, between Crete and Rhodes. He knew all things past, present and future, but was loth to tell what he knew. Those who would consult him had first to surprise and bind him during his noontide slumber in a cave by the sea, where he was wont to pass the heat of the day surrounded by his seals. Even when caught he would try to escape by assuming all sorts of shapes: now he was a lion, now a serpent, a leopard, a boar, a tree, fire, water. But if his captor held him fast the god at last returned to his proper shape, gave the wished-for answer, and then plunged into the sea. He was subject to Poseidon, and as a shepherd he to his "flocks." In post-Homeric times the story ran that Proteus was the son of Poseidon and an Egyptian, to whose court Helen was taken by Hermes after she had been carried off, Paris being accompanied to Troy by a phantom substituted for her. This is the story followed by Herodotus (ii. 112, 118), who got it from Egyptian priests, and by Euripides in the Helen. From his power of assuming whatever shape he pleased Proteus came to be regarded, especially by the Orphic mystics, as a symbol of the original matter from which the world was created. Rather he is typical of the ever-changing aspect of the sea (Homer, Odyssey, iv. 351; Virgil, Georgics, iv. 386).

PROTEUS (Proteus anguinus), in zoology, a blind perennibranchiate tailed Batrachian, inhabiting the subterranean waters of the limestone caves to the east of the Adriatic from Carniola to Herzegovina. It was long supposed to be the sole representative of the Batrachians in the cave fauna, but later examples have been discovered. It is a small eel-like animal with minute limbs, the anterior of which are tridactyle, the posterior didactyle, with a strongly compressed tail, a narrow head, with flat truncate snout, minute rudimentary eyes hidden under the skin, which is usually colourless, or rather flesh-coloured, with the short, plume-like external gills blooded; the jaws and palate are toothed. This extraordinary Batrachian has been found in a great number of different caves, but rather sporadically, and it is believed that its real home is in deeper subterranean waters, whence it is expelled at times of floods. It is often kept in aquariums, where it may turn almost black, and has bred in captivity. Proteus forms with Necturus (Menobranchus) the family Proteidae. The second genus, which is widely distributed in eastern North America, is more generalized in its structure, having better developed limbs, with four digits, and is adapted to live in the light. But the two are closely allied, and Necturus gives us a very exact idea of what sort of a type Proteus must be derived from.

In 1896 a Proteus-like Batrachian was discovered in Texas during the operation of boring an artesian well 188 ft. deep, where it was shot out with a number of remarkable and unknown Crustaceans. Typhlomolge rathbuni (see fig.), as this creature was called, agrees with Proteus in the shape of the head, in the absence of functional eyes, in the presence of external gills, and in the unpigmented skin. It differs in the very short body and the long slender limbs with four to five digits. It was first placed in the same family as Proteus, but the anatomical investigations of Ellen J. Emerson have led this author to believe that the real affinities are with the larval form of the lungless salamander Sperederes, not with Necturus and Proteus. Whilst Proteus has lungs in addition to the gills, Typhlomolge lacks the lungs, and with them the trachea and larynx. It is therefore probable that Typhlomolge is a permanent larva derived from Sperederes, whilst we are quite unable to assign any direct ancestor to Necturus.

Another blind Urodele has recently been described as Typhlonotus spelaeus, from caves in the Mississippi Valley. It has neither gills nor lungs in the adult, and is found under rocks in or out of the water. It is not allied to Proteus. The eyes are apparently normal in the larva, but in the adult they have undergone marked degeneration.

PROTHESIS (Gr. προθεσις, a setting forth, from προθεσιν, to set forward or before), in the liturgy of the Orthodox Eastern Church, the name given to the act of "setting forth" the oblation, i.e. the arranging of the bread on the paten, the signing of the cross (σαποτέταγμα) on the bread with the sacred spear, the mixing of the chalice, and the veiling of the paten and chalice (see F. E. Brightman, Liturgies Eastern and Western, 1896). The term is also used, architecturally, for the place in which this ceremony takes place, a chamber on the north side of the central apse in a Greek church, with a small table. During the reign of Justin II. (565-574) this chamber was located in an apse, and another apse was added on the south side for the diaconicon (q.v.), so that from this time the Greek church was triapsidal. In the churches in central Syria the ritual was apparently not the same, as both prothesis and diaconicon are generally rectangular, and the former, according to De Vogué, constituted a chamber for the deposit of offerings by the faithful. Consequently it is sometimes placed on the south side, if when so placed it was more accessible to the pilgrims. There is always a much wider doorway to the prothesis than to the diaconicon, and there are cases where a side doorway from the
central apse leads direct to the diaconicon, but never to the protostasis.

**PROTISTA**, a name invented by Ernst Haeckel (Generelle Morphologie der Organismen, 1866) to denote a group of organisms supposed to be intermediate between the animal and vegetable kingdoms. As knowledge advanced the precise limits of the group shifted, and Haeckel himself, in successive publications, placed different sets of organisms within it, at one time proposing to include all unicellular animals and plants, making it a third kingdom equivalent to the animal and vegetable kingdoms. Partly because the term represented an interpretation rather than an objective set of facts, the word Protista has not been generally accepted for use in classification, and, whilst recognizing that the limits of the animal and plant kingdoms are not sharply defined, modern systematists refrain from associating these doubtfully placed organisms simply because of the dubiety of their position. (See **PROTOZOA**.)

**PROTOCOL** (Fr. protocole, Late Lat. protocolum, from Gr. πρωτος, first, and κολλαω, to glue, i.e. originally the first sheet of a papyrus roll), in diplomacy, the name given to a variety of written instruments. The **protocolium** was under the late Roman Empire a volume of leaves, bound together with glue, in which public acts were recorded, so as to guard against fraud or error on the part of those responsible for preparing them; and in later usage it came to be applied to the original drafts of such acts. Thus, too, the word **protocollare** was devised for the process of drawing up public acts in authentic form (Du Cange, Glossarium lat. s.v. Protocolium). The use of the word **protocol** for the introductory and other formulae in the medieval diploma (see **DIPLOMAT**) thus explains itself as implying a recorded usage in such matters.

In the language of modern diplomacy the name of “protocol” is given to the minutes (procès-verbaux) of the several sittings of a conference or congress; these, though signed by the plenipotentiaries present, have only the force of verbal engagements (see **CONGRESS**). The name of “protocols” is also given to certain diplomatic instruments in which, without the form of a treaty or convention being adopted, are recorded the principles or the matters of detail on which an agreement has been reached, e.g. making special arrangements for carrying out the objects of previous treaties, defining these objects more clearly, interpreting the exact sense of a doubtful clause in a treaty (protocoles interprétatifs) and the like. Thus the famous Troppau protocol, which announced the right and duty of the European powers to intervene in the internal affairs of a state threatened with revolution, was from the point of view of its signatories merely a logical application of the principles contained in the treaty of the 20th of November 1815 (see **TROPPAU**). Occasionally also an agreement between two or more powers takes the form of a protocol, rather than a treaty, when the intention is to proclaim a community of views or aims without binding them to eventual common action in support of those views or aims; thus the settlement of the question of the Danish succession was recognized by the powers in conference at London, by the protocol of 1832 (see **SCHLESWIG-HOLSTEIN QUESTIONS**).

Finally, “the protocol” (protocole diplomatique, protocole de chancellerie) is the body of ceremonial rules to be observed in all written or personal official intercourse between the heads of different states or their ministers. Thus the protocol lays down in great detail the styles and titles to be given to states, their heads, and their public ministers, and the honours to be paid to them; it also indicates the forms and customary courtesies to be observed in all international acts. “It is,” says M. Pradier-Fodéré, “the code of international politeness.” See P. Pradier-Fodéré, Cours de droit diplomatique (Paris, 1899), ii. 499.

**PROTOGENES**, a Greek painter, born in Caunus, on the coast of Caria, but resident in Rhodes during the latter half of the 4th century B.C. He was celebrated for the minute and laborious finish which he bestowed on his pictures, both in drawing and in colour. Apelles, his great rival, standing astonished in presence of one of these works, could only console himself by saying that it was wanting in charm. On one picture, the “Ialysus,” he spent seven years; on another, the “Satyr,” he worked continuously during the siege of Rhodes by Demetrius Poliorcetes (305–304 B.C.) notwithstanding that the garden in which he painted was in the middle of the enemy’s camp. Demetrius, unsolicited, took measures for his safety; more than that, when told that the “Ialysus” just mentioned was in a part of the town exposed to assault, Demetrius changed his plan of operations. Ialysus was a local hero, the founder of the town of the same name in the island of Rhodes, and probably he was represented as a huntsman. This picture was still in Rhodes in the time of Cicero, but was afterwards removed to Rome, where it perished in the burning of the Temple of Peace. The picture painted during the siege of Rhodes consisted of a satyr leaning idly against a pillar on which was a figure of a partridge, so life-like that ordinary spectators saw nothing but it. Enraged on this account, the painter wiped out the partridge. The “Satyr” must have been one of his last works. He would then be about seventy years of age, and had enjoyed for about twenty years a reputation next only to that of Apelles, his friend and benefactor. Both were finished colourists so far as the fresco-painting of their day permitted, and both were laborious in the practice of drawing, doubtless with the view to obtaining bold effects of perspective as well as fineness of outline. It was an illustration of this practice when Apelles, finding in the house of Protogenes a large panel ready prepared for a picture, drew upon it with a brush a very fine line which he said would tell sufficiently who had called. Protogenes on his return home took a brush with a different colour and drew a still finer line along that of Apelles dividing it in two. Apelles called again; and, thus challenged, drew with a third colour another line within that of Protogenes, who then admitted himself surpassed. This panel was seen by Pliny (N.H. xxxv. 83) in Rome, where it was much admired, and where it perished by fire. In the gallery of the Propylaea at Athens was to be seen a panel by Protogenes. The subject consisted of two figures representing personifications of the coast of Attica, Paralus and Harmonias. For the council chamber at Athens he painted figures of the Thesmophorae, but in what form or character is not known. Probably these works were executed in Athens, and it may have been then that he met Aristotle, who recommended him to take for subjects the deeds of Alexander the Great. In his “Alexander and Pan” he may have followed that advice in the idealizing spirit to which he was accustomed. To this spirit must be traced also his “cage of Icarus,” his “seven years’ work,” and his “Phoebus and Eos” in the baths of Rhodes. Among his portraits are mentioned those of the mother of Aristotle, Philiscus the tragic poet, and King Antigonus. But Protogenes was also a sculptor to some extent, and made several bronze statues of athletes, armed figures, huntsmen and persons in the act of offering sacrifices.

**PROTOGENES** (E. Haeckel), a little-known genus of Foraminifera (g.), marine organisms, forming a naked flat disk with numerous long radiating pseudopodia; nucleus and contractile vacuole not seen, and reproduction unknown.

**PROTOMYXA** (E. Haeckel), a genus of Foraminifera (g.), marine organisms, of orange colour, naked and reproducing in a broad-cyst which liberates 1-flagellate zoospores.

**PROTOPLASMA**, the term given in pathology to a substance composing, wholly or in part, all living cells, tissues or organisms of any kind, and hence regarded as the primary living substance, the physical and material basis of life. The term “protoplasm,” from πρωτοσ, first, and παλαμα, formed substance, was coined by the botanist Hugo von Mohl, in 1846, for the “tough, slimy, granular, semi-fluid” constituent of plant cells, which he distinguished from the cell-wall, nucleus and cell-sap. This was not, however, the first recognition of the true living substance as such, since this step had been achieved in 1835 by the French naturalist F. Dujardin, who in his studies on Foraminifera had proposed the term “sarcode” for the living material of their bodies in the following words: “Je propose de nommer ainsi ce que d’autres observateurs ont appelé une gelée vivante, cette substance glutineuse,
diaphane, insoluble dans l’eau, se contractant en masses globuleuses, s’attachant aux aiguilles de dissection, et se laissant étirer comme du mucus, enfin se trouvant dans tous les animaux inférieurs interposées aux autres éléments de structure.” To the French naturalist belongs, therefore, the real credit of the discovery of protoplasm, or rather, to be more accurate, of the first recognition of its true nature as the material basis of vital phenomena. Neither Dujardin nor von Mohl, however, had any conception of the universal occurrence and fundamental similarity of protoplasm in all living things, whether animal or vegetable, and it was not till 1861 that the identity of animal sacrode and vegetable protoplasm was proclaimed by Max Schultze, whose name stands out as the forerunner, if not the founder, of the modern notions concerning the nature of the living substance. From this time onwards the term “protoplasm” was used for the living substance of all classes of organisms, although it would have been more in accordance with the custom of priority in nomenclature to have made use of Dujardin’s term “sarcode.”

A living organism, of any kind whatsoever, may be regarded as composed of (1) protoplasm, (2) substances or structures produced by the protoplasm, either by differentiation or modification of the protoplasm itself, or by the excretory or secretory activity of the living substance. The protoplasm of a given organism may be in a single individual mass, or may be aggregated into a number of masses or units, discontinuous but not disconnected, termed cells (see CYTOLOGY). Thus living organisms may be distinguished, in a general way, as unicellular or multicellular. An instance of a unicellular organism is well seen in an Amoeba, or in one of the Foraminifera, classic examples for the study of undifferentiated protoplasm, which here composes the greater part of the body, while products of the formative activity of the protoplasm are seen in the external shell and in various internal granules and structures. As an example of a multicellular organism we may take the human body, built up of an immense number of living cells which produce, singly or in cooperation, a variety of substances and structures, each contributing to the functions of the body. This, without attempting to enter into details, the horny epidermis covering the body, the hairs, nails, teeth, skeleton, connective tissue, &c., are all of them products formed by the metabolic activity of the living substance and existing in intimate connexion with it, though not themselves to be regarded as living. In addition to metabolic products of this kind, special modifications of the living substance itself are connected with specializations or exaggerations, as it were, of a particular vital function; such are the contractile substance of muscular tissue, and the various mechanisms serving for the movements of nervous and sensory tissue. It is necessary, therefore, in a living body of any kind, to distinguish clearly between simple protoplasm, its differentiations and its products.

Protoplasm from whatever source, whether studied in a cell of the human body, in an Amoeba or Foraminifer, or in a vegetable organism, is essentially uniform and similar in appearance and properties. Its appearance, graphically described by Dujardin in the passage quoted above, is that of a greyish, viscid, slimy, semi-transparent and semi-fluid substance. Its properties are those of living things generally, and the most salient and obvious manifestation of life is the power of automatic movement exhibited by living protoplasm. When free and not limited by firm envelopes, the movements take the character known generally as amoeboid, well shown in the common Amoeba or in the white corpuscles of the blood. When confined by rigid envelopes, as in plant-cells, the protoplasm exhibits movements of various kinds. Even the simplest forms of the living matter—and that is to say, the capacity of assimilating substances different from itself, of building them up into its own substance (anabolism), and of again decomposing these complex molecules into simpler ones (katabolism) with production of energy in the form of heat, movement and electrical phenomena. An important part of the metabolic process is respiration, i.e. the absorption of oxygen from the surrounding medium and oxidation of carbon atoms to form carbonic acid gas and other simple chemical compounds; in ordinary plant and animal protoplasm the process of respiration seems to be of universal occurrence, but some Bacteria constitute apparently an exception to the rule. Metabolism results not only in the generation of energy, but also, if anabolism be in excess of katabolism, in increase of bulk, and consequent growth and reproduction.

Living protoplasm is, therefore, considered from a chemical standpoint, in a state of continual flux and instability, and it follows that if protoplasm be a definite chemical substance or mixture of substances (see below), a given sample of protoplasm cannot be pure, or at least cannot remain so for any length of time so long as its power of metabolism is being exerted, but will contain particles either about to be built up by anabolism into its substance, or resulting from katabolic disintegration of its complex molecules. Hence it is convenient to distinguish the living substance from its metabolastic products of anabolism and katabolism. Such products are to be recognized invariably in protoplasm and take the form generally of granules and vacuoles. Granules vary in size from very minute to relatively large, coarse grains of matter, usually of a firm and solid nature. To the presence of innumerable granules is due the greyish, semi-transparent appearance of protoplasm, which in parts free from granules appears hyaline and transparent. Different samples of protoplasm may vary greatly in the number and coarseness of the granulations. Vacuoles are fluid drops of more watery consistence, which, when relatively small, assume a spherical form, as the result of surface tension acting upon a drop of fluid suspended in another fluid. When vacuoles are numerous and large, however, they may assume various forms from mutual pressure, like air-bubbles in a foam. A good example of frothy protoplasm, due to the presence of numerous vacuoles, is seen in the common “sun-animalcule” (Acinosthcarium). Or when the cell is confined by an envelope, and becomes very vacuolated, the vacuoles may become confluent to form a cell-sap contained in a protoplasmic lining or “primordial utricule,” and traversed by strands of protoplasm, as in the ordinary cells of plant-tissues. In many unicellular organisms, so-called contractile vacuoles are continually being formed as an act of excretion and expelled from the body when they reach a certain size.

While the majority of protoplasmic granules are probably to be regarded as metaplastic in nature, there is one class of granulations of which this is certainly not true, namely the grains of chromatin, so named from their peculiar affinity for certain dyes, such as carmine, logwood and various aniline stains. These grains may occur as chromidia, scattered through the protoplasm, or they may be concentrated at one or more spots to form a definite nucleus or nuclei, which may or may not be limited from the remaining protoplasm by a definite membrane, and may undergo further differentiations of structure which cannot be considered further here (see CYTOLOGY). The protoplasm of an ordinary cell is thus specialized into nucleus and cytoplasm. It was formerly thought that the most primitive forms of life, the Monera of E. Haeckel, consisted of pure protoplasm without a nucleus. It must be borne in mind, however, that chromatin can be present without being concentrated to form a definite nucleus, and that with imperfect technique the chromatin may easily escape observation. It seems justifiable at present to believe, until the contrary has been proved, that all organisms, however primitive, contain chromatin in some form: first, because this substance has been found when suitable methods for its detection have been employed; secondly, because it has been shown experimentally, by cutting up small organisms, such as Amoeba, that enucleated fragments of protoplasm are unable to maintain their continued existence as living bodies; and, thirdly, because modern research has shown the chromatin to be of very great, perhaps fundamental, importance in regulating the vital processes of the cell and so determining the specific characters of the organism, a property which enables the chromatin to act
as the vehicle of heredity and to transmit the characters of parent to offspring. In the present state of our knowledge, therefore, the peculiar chromatin-granules must be regarded as an integral part, perhaps even the most essentially and primarily important portion, of the living substance. At the same time it must be borne in mind that the term "chromatin" does not denote a definite chemical substance, to be recognized universally by hard and fast chemical tests. The chromatin of different organisms or cells may behave quite differently in relation to stains or other reactions; and if it be true that it is the chromatin which determines the nature and activities of the cell, it follows that no two cells which differ from one another in any way can have their chromatin exactly similar. The conception of chromatin is one based upon its relations to the vital activities and life cycle, as a whole, of the organism or cell, and not upon any definable material, that is chemical and physical, properties.

The importance of protoplasm, as the physical and material basis of life, has caused it to be the subject in recent years of much minute and laborious research. It seems obvious that matter to which is peculiarly endowed must possess a complexity of structure and organization far exceeding that which at first sight meets the eye. Some biologists have attacked the problem of the ultimate constitution of protoplasm from a purely theoretical standpoint, and have framed hypotheses of an ultramicroscopic constitution sufficient, in their opinion, to explain, or at least to throw light upon, the vital activities of the living substance. Others, proceeding by more empirical methods, have attempted to lay bare the structure of protoplasm by means of the refinements of modern microscopical technique, or to solve the question of its constitution by means of chemical and physiological investigation. Hence a convenient distinction, not always easy, however, to maintain in practice, is drawn between speculative and empirical theories of protoplasm.

1. Speculative theories have come with the greatest frequency from those who have attempted to find a material explanation of the phenomena of heredity (q.v.). A instance may be mentioned more particularly the "gemules" of Darwin, the "pangenes" of de Vries, the "plastidules" of Haeckel, and the "biophores" of Weismann. These theories have been ably brought together and discussed by Delage, who has included them all under the term "micromerism," since they agree in the assumption that the living substance contains, or consists of, a vast number of excessively minute particles — i.e. aggregates or combinations of molecules, which give to the protoplasm its specific properties and tendencies ("idioplasm" of Nägeli). In other cases the assumption of invisible protoplasmic units has been inspired by a desire either to explain the general vital and assimilative powers of protoplasm, as, for example, the "miclæ" of Nägeli and the "plasomes" of Wiesner, or to elucidate the mechanism of some one function, such as the "insatagms" of Engelmann, assumed to be the agents of contractility. In general, it must be said of all these speculative views that they can only be extended to all vital phenomena by the help of so many subordinate hypotheses and assumptions that they become unworkable and unintelligible, or that they only carry the difficulties a step further back, and really explain nothing. Thus it is postulated for Wiesner's hypothetical plasomes that they possess the power of assimilation, growth and reproduction by division; in other words, that they are endowed with just those properties which constitute the unexplained mystery of living matter.

2. Empirical theories of protoplasm differ according as their authors seek to find one universal type of structure or constitution common to all conditions or differentiations of the living substance, or, on the contrary, are of opinion that it may vary fundamentally in different places or at different times. From these two points of view protoplasm may be regarded either as monomorphic or polymorphic (Fischer). The microscopical investigation of protoplasm reveals at the first glance a viscid, slimy or mucilaginous substance, in which is embedded an immense number of granules, for the most part very tiny. Very rarely are these granules absent, and then only from a portion of the protoplasm, and only temporarily. Hence many authors have regarded the minute granules — the "microsomes" of Hanstein—as themselves the ultimate living units of protoplasm, in opposition to those who would regard them merely as "metaplasm" substances, i.e. as the heterogeneous by-products of metabolism and vital activity. The granular theory, as this conception of the living substance is called, has received its extreme elaboration at the hands of Altman, whose standpoint may be taken as typical of this class of theories. After demonstrating the universal occurrence of granules in protoplasm, Altman has compared each individual granule to a free-living bacterium, and thus regards a cell as a colony of minute organisms, namely the granules or "bioblasts," as he has termed them, living embedded in a common matrix, like a zoogloea colony of bacteria. Of this theory it may be remarked, firstly, that it brings us no nearer to an explanation of vital phenomena than do the plasomes of Wiesner; secondly, that to consider bacteria as equivalent, not to cells, but to cell granules, is to assume for the cell of organisms a possibly fundamental unit which is, to say the least, doubtful; and, thirdly, that the observations of the vast majority of competent microscopists furnish abundant support for the statement that granules of protoplasm do not lie free in a structureless matrix, but are embedded in the substance of a minute and delicate framework or "morphoplasm," which in its turn is bathed by a watery fluid or "enchylema" permeating the whole substance. The upholders of the granular theory deny the existence of the framework, or explain it as due to an arrangement of the granules, or as an optical effect produced by the matrix between the granules. Amongst those, on the other hand, who assert the existence of a framework distinct from granules and enchylema, the utmost diversity of opinion prevails with regard to the true structural relations of these three parts and the rôle played by each in the exercise of vital functions. Some have regarded the framework as made up of a tangle of separate fibrillae ("filar theory")—a view more especially connected with the name of Flemming—but most are agreed that it represents the appearance of a reticulum or network with excessively fine meshes, usually from \(\frac{1}{2}\) to 1 \(\mu\) in diameter. The reticulum carries the granules at its nodal points, and is bathed everywhere by the enchylema. Even so much in common, however, opinions are still greatly at variance. In the first place, the majority of observers interpret the reticulum as the expression of an actual spongy framework, a network of minute fibrillae ramifying in all planes. While, however, Heitzmann, following the speculations of Brücke, considered the framework itself to be actively contractile and the seat of all protoplasmic movement, an opposite point of view is represented by the writings of Leydig, Schäfer and others, who regard the reticulum merely as a kind of supporting framework or "spongiosplasm," in which is lodged the enchylema or "kysiosplasm," considered to be itself the primary motile and living substance. Bütschli, on the other hand, has pointed out the grave difficulties that attend the interpretation of the reticulum as a fibrillar framework, in view of the distinctly fluid consistency of, at any rate, most samples of protoplasm. For if the substance of the framework be assumed to be of a firm, solid nature, then the protoplasm as a whole could not behave as a fluid, any more than could a sponge soaked in water. On the other hand, the hypothesis of a fluid fibrillar framework leads to a physical impossibility, since one liquid cannot be permanently suspended in another in the form of a network. Bütschli therefore interprets the universally present reticulum as a meshwork of minute lamellae, forming a honeycombed or "alveolar" structure, similar to the arrangement of fluid lamellae in a fine foam or lather, in which the interstices are filled, not with air but with another fluid; in other words, the structure of protoplasm is that of an exceedingly fine emulsion of two liquids not miscible with one another.

It may be claimed for the alveolar theory of Bütschli that it throws light upon many known facts relating to protoplasm. It interprets the reticulum as the optical section of a minute foam-like structure, and permits the formation of protoplasmic striations and of apparent fibrin as the result of linear or radiating dispositions of the alveolar...

479

framework; it reconciles with the laws of physics the combination of a framework with a fluid or semi-fluid aggregate condition, while variations in the fluidity of the framework are compatible with a softening of the protoplasm almost to the pitch of rigidity, as seen, for example, in the egg of sponges; and finally it explains the peculiar structural peculiarities of protoplasm, such as the superficial layer of radially arranged alveoli, the spherical form of vacuoles, the continuous wall or pellicle which limits both the vacuoles and the protoplasm as a whole, and any other peculiarities of the theory of a sponge-like structure. Bütschli has succeeded, moreover, in producing artificial foams of minute structure, which not only mimic the appearance of protoplasm, but can be made to exhibit all the motile movements of the simplest protoplasmic organisms. Incidentally these experiments have shown that many of the apparent granulations and “microsomes” are an optical effect produced by the nodes of the minute framework. These recent experiments furnish a powerful support for Bütschli's theory of alveolar structure to many other substances, and has tried to prove that it is a universal characteristic of colloid bodies, a view strongly combated, however, by Fischer. While it cannot be claimed that Bütschli's theory furnishes in any way a complete explanation of life, leaving untouched, as it does, the fundamental question of assimilation and metabolism, he at least draws attention to a very important class of facts, which, if demonstrated to be of universal occurrence, must be reckoned with in future theories of the protoplasm question, and would form an indispensable preliminary to all speculations upon the mechanism of the living substance.

In opposition to the above-mentioned monomorphous theories of protoplasm, all of which agree in assuming the existence of some fundamental type of structure in all living substance, attempts have been made at various times to show that the structural appearances seen in protoplasm are in reality artificial products, due to precipitation or coagulation caused by reagents used in the study or preparation of living objects. These views have been developed by Fischer, who by experimenting upon various proteids with histological fixatives, has shown that it is possible to produce in them a granular, reticular or alveolar structure, according to treatment, and, further, that granules so produced may be differentially stained according to their size and absorptive powers. Fischer therefore suggests that such structural appearances seen in protoplasm may be purely artificial, and does not extend this view to all such structures, which would indeed be impossible, in view of the frequency with which reticular or alveolar structures have been observed during life. He suggests, however, that such structures may be temporary results of vital precipitation of proteids within the organism, and that protoplasm may have at different times a granular reticular or alveolar structure, or may be homogeneous. Fischer's conception of living protoplasm is therefore that of a polymorphic substance, and a similar view is held at the present time by Fleming, Wilson and others. Strassburger also regards protoplasm as composed of two motile "kinoplasts" which is fibrillar, and a nutritive "trophoplasm" which is alveolar, in structure. The chemical investigation of protoplasm laboratories at the outset under the disadvantage that it cannot deal with the living substance as a whole, since no analysis can be performed upon it without destroying the life. Protoplasm consists, to the extent of about 60% of the total mass of the body, of a mixture of various "nucléo-proteids"—that is to say, of those substances which, in molecular structure and chemical composition, are the most complex bodies known. In association with them are always found varying amounts of fats, carbohydrates, and other bodies, and such compounds are always present in the living substance to a greater or lesser degree as products of both upward and downward metabolism. Protoplasm also contains a large but variable percentage of water, the amount of which present in any given case affects largely its fluid or viscous aggregate condition. Special interest attaches to the remarkable class of bodies known as ferments or enzymes, which when prepared and isolated from the living body are capable of effecting in other substances chemical changes of a kind regarded as specifically vital. It is from this study, and from that of the complex proteids found in the living body, that the greatest advances towards an explanation of the properties of living matter may be expected at the present time.

The question may be raised how far it is probable that there is one universal living substance which could conceivably be isolated or prepared in a pure state, and which would then exhibit the phenomena characteristic of vital activity. It is sufficiently obvious, in the first place, that protoplasm is at least of infinite diversity of character, and that no two samples of protoplasm are absolutely similar in all respects. Chemical differences must be assumed to exist not only between the vital fabrics of allied species of protoplasm, but between any two samples of the same species. Kassowitz regards this variability as compatible with the assumption of a gigantoprotoplasm molecule in which endless variations arise by changes in the combinations of a vast number of variants, and that it is not difficult to conceive of any single substance, however complex in its chemical constitution, which could perform all the functions of life. To postulate a universal living substance is to proceed along a path which leads to difficulties of a very different kind. However, these difficulties, arising in the first place from the occurrence of so many different similar units, since the ultimate living particles must then be imagined as endowed at the outset with many, if not all, of the fundamental properties and characteristic actions of living bodies. Such a conception has as its logical result a vitalistic standpoint, which may or may not embody the correct mental attitude with regard to the study of life, but which at any rate tends to check any further advance towards an explanation or analysis of elementary vital phenomena. We may rather, with Kölker, Verworn and others, regard the activities of protoplasm as not individual interaction of many substances, no single one of which can be considered as living in itself, but only in so far as it forms an indispensable constituent of a living body. From this point of view life is to be regarded, not as an inherent property of protoplasm, but as the expression of the ever-changing relations existing between the many substances which make up the complex and variable organisms known to us as protoplasm.

PROTOZOA (Gr. πρῶτος, first, and ζωή, living thing), the name given by modern zoologists to the animalcules, for the most part microscopic, which were termed by the older naturalists Infusoria, from the manner in which they appear in infusions containing decaying animal and vegetable matter. The name Infusoria is now, however, restricted to one of the four classes which comprise the Protozoa proper. The name Protozoa was coined as far back as 1820 as an equivalent for the German word Protostiere, meaning animals of primitive or archaic nature, the forms of animal life which may be supposed to have been the first that appeared upon our globe. The great naturalist C. T. von Siebold was, however, the first to give a scientific definition to the group. Von Siebold pointed out that in the Protozoa the individual was always a single vital unit or cell, in contrast with the higher division of the animal kingdom, the Metazoa, in which the body is generally, though not universally, regarded as composed of many such units. To put the matter briefly and somewhat technically: the Protozoa are unicellular animals, the Metazoa multicellular animals; in the Protozoa the cell is complete in itself, both morphologically and physiologically, and is capable of maintaining a separate and independent existence in suitable surroundings, like any other organism; in the Metazoa the cells are differentiated for the performance of distinct functions and combined together to form the various tissues of which the body is built up, and the individual cells of the Metazoan body are not capable of maintaining a separate existence apart from their fellows. This is the sense in which the term Protozoa is used by zoologists, whereby certain forms of animal life, which were formerly ranked as Protozoa, such as sponges and rotifers, are now definitely excluded from the group and classed as Metazoa.

The animal kingdom may be divided, therefore, into two sub-kings, the Protozoa and the Metazoa, the first named characterized by their essentially unicellular nature. This is a criterion by which it is easy to define the Protozoa from a purely
PROTOZOA

zoological standpoint, but which becomes less satisfactory when we take into consideration the whole range of microscopic unicellular organisms. Besides the true Protozoa, which, except the Haptophyta, are organisms of animal nature, there are many other organisms of equally simple organization, including the Bacteria and the unicellular plants. The Bacteria stand apart from the other forms of life, not only in many cases, by their divergent methods of metabolism, but by morphological characteristics, such as the definite body-form limited by a distinct envelope, the absence of organs for locomotion other than the peculiar flagella, and, above all, by the lack of any differentiation of the body-protoplasm into nucleus and cytoplasm, as in all true cells of either animal or vegetable nature. On the other hand, to separate by hard-and-fast definitions the unicellular plants from the unicellular animals is not only difficult but practically impossible. The essential difference between plant and animal is a physiological one, a difference in the method of nutrition. A typical green plant is able to live independently of other organisms and to build up its substance from simple gases in the air and inorganic salts in the soil or water, provided that certain conditions of light and moisture be present in its environment; this is the so-called holophytic method of nutrition. A typical animal, on the other hand, while practically independent of sunlight, is not able to exist apart from other living organisms, since it is not able to build up its substance from simple chemical constituents like a plant, but must be supplied with ready-made proteids in its food, for which it requires other organisms, either plants or animals; this is the so-called holozoic method of nutrition. Intermediate between these two habits of life is the so-called saprophytic habit, exemplified by the fungi amongst plants; in this method of nutrition the organism cannot build up its substance entirely from inorganic substances, but absorbs the organic substances present in solutions containing organic salts or decaying animal or vegetable matter.

If we regard the organisms termed collectively Protozoa from the point of view of their methods of nutrition (considering for the present only free-living, non-parasitic forms), we find in one class, the Flagellata, examples of the three methods mentioned above, the holozoic, holophytic and saprophytic habit of life, not only in species closely allied to each other, but even combined in one and the same species at different periods of its life or in different surroundings. An individual of a given species may contain chlorophyll, with which it decomposes carbonic acid gas in the sunlight, like a plant, while possessing a definite mouth-aperture, by means of which it can ingest solid food, like an animal. Such instances show clearly that in the simplest cases of the difference between plant and animal is not a difference of habit and of mode of nutrition, to which the organism is not at first irrevocably committed, and which are not at first accompanied by distinctive morphological characteristics. Only when the organism becomes specialized for one or the other mode of life exclusively does it acquire such definite morphological characters that the difference between plant and animal can be used for the purpose of a natural classification, as in the higher forms of life. In the lowest forms it is not possible to base natural subdivisions on their vegetable or animal nature. For this reason it has been proposed by E. Haeckel to unite all the primitive forms of life in which the body is morphologically equivalent to a single cell into one group, the Protista, irrespective of their animal or vegetable nature. In this method of dealing with the primitive Protista are regarded as a distinct kingdom (Reich), more or less intermediate between, but distinct from, the animal and vegetable kingdoms, and representing the ancestral stock from which both animals and plants have sprung. Many authorities have followed Haeckel's lead in the matter, and the science of Protistology or Protistenkunde has already a special journal devoted to the publication of researches upon it. But though it may be more scientific, from a theoretical point of view, to group all these primitive organisms together in the way suggested by Haeckel, in practice it is inconvenient, on account of the vast number of forms of life to be comprised as Protista, their diversity in habit of life and organization, and above all, the difference in the technical methods required for their study, which becomes too complicated for a single worker. Hence Protistology becomes split up in practice by its own mass into three sciences: the Bacteria are the objects of the science of bacteriology; botanists deal with the unicellular plants; and the zoologists with those Protista which are more distinctly animal in their characters.

Hence the Protozoa are to be regarded as a convenient rather than a natural group, and may be characterized generally as follows: Organisms in which the individual is a single cell, that is to say, consists of a single undivided mass of protoplasm which is capable of independent existence in a suitable environment; if many such individuals are combined together to form a colony, as frequently occurs, there is no differentiation of the individuals except for reproductive purposes, and never for tissue-formation as in the Metazoa. The body always contains chromatin or nuclear substance, which may be disposed in various ways, but usually forms one or more concentrated masses termed nuclei, which can be distinguished sharply from the general body-protoplasm or cytoplasm. The protoplasmic body may be naked at the surface, or may be limited and enclosed by a distinct envelope or cell-membrane, which is not usually of the nature of cellulose, except in holophytic forms. Organ serving for locomotion and for the capture and assimilation of solid food are usually present, but may be wanting altogether when the mode of nutrition is other than holozoic; chlorophyll, on the other hand, is only found as a constituent of the body-substance in the holophytic Flagellata. To these characters it may be added that reproduction is effected by some form of fission, or division of the body into smaller portions, and that in the vast majority of Protozoa, if not in all, a process of conjugation or syngamy occurs at some period in the life-cycle, the essential feature of the process being fusion of nuclear matter from distinct individuals. The foregoing definition does not distinguish the Protozoa sharply from the primitive forms of plant-life, with which, as stated above, they are connected by many transitions; but the differentiation of the body-substance into nucleus and cytoplasm separates them at once from the Bacteria, in which the chromatin is distributed evenly through the body-protoplasm.

Protozoa and Disease.—The study of the Protozoa has acquired great practical importance from the fact that many of them live as parasites of other animals, and as such may be the cause of dangerous diseases and epidemics in the higher forms of animal life and in man (see Parasitic Diseases). Examples of parasitic forms are to be found in all the four classes into which, as will be stated below, the Protozoa are divided, and one class, the Sporozoa, is composed entirely of endoparasitic forms. Hence Protozoology, as it is termed, is rapidly assuming an importance in medical and veterinary science almost equal to that of bacteriology, although the recognition of Protozoa as agents in the production of disease is hardly older than a decade. The most striking instances of Protozoa well established as pathogenic agents are the malarial parasites, the species of Plasmodium causing haemoglobinuria of cattle and other animals, the trypanosomes causing tsetse-fly disease, sura, sleeping sickness, and other maladies, the species of Leishmania causing kala azar and oriental sore, and the Amoeba responsible for the so-called amoebic dysentery. Other diseases referred, but not yet doubtfully, to the agency of Protozoa are syphilis, small-pox, hydrophobia, yellow fever, and even cancer.

It is only possible here to discuss briefly in a general way the relations of these parasites to their hosts. When two organisms stand habitually in the relation of host and parasite, an equilibrium tends to become established gradually between them, so

---

1 Many Protozoa contain symbiotic green organisms, so-called zoochlorellae or zooxanthellae, in their body-protoplasm; for instance, Radiolaria, and Ciliata such as Paramecium bursaria. &c. This condition must be carefully distinguished from chlorophyll occurring as a cell constituent.
that a condition is brought about in which, after many generations, the host becomes "tolerant" of the parasite, and the parasite is not lethal to the host, though perhaps capable of setting up considerable disturbance in its vital functions. Many animals are found to contain almost constantly certain internal parasites without being, apparently, in the least affected by them; and it should be borne in mind that in most cases it is not to the interest of the parasite to destroy the host or to over-tax its resources. But when the parasite is transferred naturally or artificially to a species or race of host which does not ordinarily harbour it, and which therefore has not acquired powers of resisting its attacks, the parasites may be most deadly in their effects. Thus the white traveller in the tropics is exposed to far greater dangers from the indigenous disease-producing organisms than are the natives of those climates.

In some cases two organisms have become mutually adapted to each other as host and parasite to such an extent that the parasite is not capable of flourishing in any other host. An instance of this is Trypanosoma lewisi of the rat, which cannot live in any other species of animal but a rat, and which is not as a rule lethal to a rat, at least not to one otherwise healthy.

Contrasting in an instructive manner with this species is Trypanosoma brucei, which occurs as a natural parasite of buffaloes and other big game in Africa, and is, apparently, harmless to them, but which is capable of being transferred to other animals by inoculation. The transference may take place naturally, by the bite of a tse-tse-fly, or may be effected artificially; in either case T. brucei is extremely lethal to certain animals, such as imported cattle, horses and dogs, or to rats and guinea-pigs.

Other animals, however, may be quite "repellent" to this parasite, that is, to say, if it be inoculated into their blood it dies out without producing ill effects, just as T. lewisi does when injected into an animal other than a rat. Thus it is seen that T. brucei, when introduced into the blood of an animal which is specifically or racially distinct from its natural hosts in the region where it is indigenous, is either unable to maintain itself in its new host, or flourishes in it to such an extent as to be the cause of its death.

We may assume, therefore, at least as a working hypothesis, that a lethal parasite is one that is new to its host, and that a harmless parasite is one long established. Since all parasites must have been new to their proper hosts at some period, recent or remote, in the history of the species, it would follow that the first commencement of parasitism would be in almost all cases a life and death struggle, as it were, between the two organisms concerned, and it is quite conceivable that the host might succumb in the struggle and so be exterminated. Ray Lankester has suggested that the extinction of many species of animals in the past may have been due, in some cases, to their having been attacked by a species of parasite to which they did not succeed in becoming adapted, and by which they became, in consequence, exterminated entirely.

**Organization of the Protozoa.**—The body-form may be constant or inconstant in the Protozoa, according as the body-substance is or is not limited at the surface by a firm envelope or cuticle. When the surface of the protoplasm is naked, as in the common amoeba and allied organisms, the movements of the animal bring about continual changes of form. The protoplasm flows out at any point in a mass termed pseudopodia, which are being continually retracted and formed anew. Such movements are known as amoeboid, and may be seen in the cells of Metazoa as well as in Protozoa. The pseudopodia serve both for locomotion and for the capture of food. If equally developed on all sides of the body, the animal as a whole remains stationary, but if formed more on one side than the other, the mass of the body shifts its position in that direction, but the movement of translation is generally slow. If the animal remains perfectly quiescent and inactive, the laws of surface-tension acting upon the semi-fluid protoplasmic body cause it to assume a simple spherical form, which is also the type of body-form generally characteristic of Protozoa of floating habit (Radiolaria, Heliozoa, &c.).

In the majority of Protozoa, however, the protoplasm is limited at the surface by a firm membrane or cuticle, and in consequence the body has a definite form, which varies greatly in different species, according to the habit of life. As a general rule those forms that are fixed and sedentary in habit tend towards a radially symmetrical structure; those that are free-swimming approach to an ovoid form, with the longest axis of the body placed in the direction of movement; and those that creep upon a firm substratum have the lower side of the body flattened, so that dorsal and ventral surfaces can be distinguished; it is very rare, however, to find a bilaterally symmetrical type of body-structure amongst these organisms. In some cases the cuticle may be too thin to check completely the changes of form due to the movements of the underlying protoplasm; instances of this are seen amongst the so-called "metabolic" Flagelata, in which the body exhibits continually changes of form, termed by Lankester "euglenoid" movements, due to the activity of the superficial contractile layer of the body manifesting itself in ring-like constrictions passing down the body in a manner similar to the peristaltic movements of the intestine.

The body-substance of the Protozoa is protoplasm, or, as it was originally termed by Dujardin, sarcod, which is finely alveolar in structure, the diameter of the alveoli varying generally between ½ and 1 µ. At the surface of the body the alveoli may take on a definite honeycomb-like arrangement, forming a special "alveolar layer," which in optical section appears radially striated. Besides the minute protoplasmic alveoli, the protoplasm often shows a coarse vacuolation throughout the whole or a part of its substance, giving the body a frothy structure. When such vacuoles are present they must be carefully distinguished from the contractile vacuoles and food-vacuoles described below; from the former they differ by their non-contractile nature, and from the latter by not containing food-substances.

In many Protozoa and especially in those forms in which there is no cuticle, the body may be supported by a skeleton. The material of the skeleton differs greatly in different cases, and may be wholly of an organic nature, or may be impregnated with, or almost entirely composed of, inorganic mineral salts, in which case the skeletal substance is usually either silica or carbonate of lime. From the morphological point of view the organs of the skeleton may be divided into two principal classes, according as they are formed internal to, or external to, the body in each case. Instances of internal skeletons are best seen in the spherical floating forms comprised in the orders Radiolaria and Heliozoa; such skeletons usually take the form of spicules, radiating from the centre to the circumference, and often further strengthened by the formation of tangential bars, producing by their union a lattice-work, which in species of relatively large size may be formed peripherally at the surface as the animal grows so that the entire skeleton takes the form of concentric hollow spheres held together by radiating beams. The architectural types of these skeletons show, however, an almost infinite diversity, and cannot be summarized briefly. External skeletons have usually the form of a shell or house, in which the body can be retracted for protection, and from which the protoplasm can issue forth during the animal's phases of activity. Shells of this kind, which must be carefully distinguished from cuticles or other membranes that invest the body closely, are well seen in the order Foraminifera; in the simplest cases they are monaxon in architecture, that is to say, with one principal axis round which the shell is radially symmetrical, and at one pole is a large aperture through which the protoplasm can creep out. In addition to the principal aperture, the shell may or may not be pierced all over by numerous fine pores, through which also the protoplasm can pass out. For further details concerning these shells and their very numerous varieties of structure the reader is referred to the article FORAMINIFERA.
The protozolic body of the Protozoa is frequently differentiated into two zones or regions: a more external, termed the ectoplasm or ectsarc, and a more internal, termed the endoplasm or endosarc. The ectsarc is distinguished by being more clear and hyaline in appearance, and more tough and viscid in consistency; the endoplasm, on the other hand, is more granular and opaque, and of a more fluid nature. The ectoplasm is the protective layer of the body, and is also the portion most concerned in movement, in excretion, and perhaps also in sensation and in functions similar to those performed by the nervous systems of higher animals. The endoplasm, on the other hand, is the chief seat of digestive and reproductive functions.

As the protective layer of the body, the ectoplasm forms the envelopes or membranes which invest the surface of the body, and which are differentiation of the outermost layer of the ectoplasm. Thus in most Flagellata the ectoplasm is represented only by the more or less firm outer covering or periplast. Even when such envelopes are absent, however, the ectoplasm can still be seen to exert a protective function; as, for instance, in those Myxosporidia which are parasitic in the gall-bladders or urinary bladders of their hosts, and which can resist the action of the juices in which they live so long as the ectoplasm is intact, but succumb to the action of the medium if the ectoplasm be injured. In many Infusoria the ectoplasm contains special organs of offence termed trichocysts, each a minute ovoid body from which, on stimulation, a thread is shot out, in a manner similar to the nematocysts of Coelenterata. Similar organs are seen also in the spores of Myxosporidia, as the so-called polar capsules; but in this case the organs are not specially ectoplasmic, and appear to serve for adhesion and attachment, rather than for offence.

The connexion of the ectoplasm with movement is seen in the simplest forms, such as Amoeba, by the fact that all pseudopodia arise from it in the first instance. In forms with a definite cuticle, on the other hand, the ectoplasm usually contains contractile fibres or myonemes, forming, as it were, the muscular system of the organism. The dependence of the motility of the animal upon the development of the ectoplasm is well seen in Gregarines, in which other organs of locomotion are absent; in forms endowed with active powers of locomotion a distinct ectoplasmic layer is present below the cuticle; in those Gregarines incapable of active movement, on the other hand, the ectoplasm is absent or scarcely recognizable.

From the ectoplasm arise the special organs of locomotion, which, when present, take the form of pseudopodia, flagella or cilia. Pseudopodia, as already explained, are temporary protoplasmic organs which can be extruded or retracted at any point; they fall naturally into two principal types, between which, however, transitions are to be found: first, slender, filamentous or flosse pseudopodia, composed of ectoplasm alone, which may remain separate from one another, or may anastomose to form networks, and are then termed reticulose; secondly, thick, blunt, so-called lobose pseudopodia, which are composed of ectoplasm with a core of endoplasm, and never form networks. In forms showing active locomotor powers the pseudopodia are usually more lobose in type; flosse pseudopodia, on the other hand, are more adapted for the function of capturing food.

Flagella are long, slender, vibratile filaments, generally few in number when present, and usually placed at the pole of the body which is anterior in progression. Each flagellum performs peculiar lashing movements which cause the body, if free, to be dragged along after the flagellum in jerks or leaps; if, however, the body be fixed, the action of the flagellum or flagella causes a current towards it, by which means the animal obtains its food-supply. A flagellum which is anterior in movement has been distinguished by Lankester by the convenient term tractellum; sometimes, however, the flagellum is posterior in movement and acts as a propeller, like the tail of a fish; for this type Lankester has proposed the term pulselium. The flagellum appears to arise in all cases from a distinct basal granule, and in some cases, as in the genus Trypanosoma, there is a portion of the nuclear apparatus set apart as a distinct kinetic nucleus, with the function, apparently, of governing the activities of the flagellum.

Cilia are minute, hair-like extensions of the ectoplasm, which pierce the cuticle and form typically a furry covering to the body. Though perhaps primitively derived from flagella, cilia, in their usual form, are distinguished from flagella by being of smaller size, by being present, as a rule, in much greater numbers, and above all by the character of their movements. In the place of the complicated lashing movements of the flagella, each cilium performs a simple stroke in one direction, becoming first bowed on one side, by an act of contraction, and then straightened out again when relaxed. The movements of the cilia are coordinated and they act in concert, though not absolutely in unison, each one contracting just before or after its neighbour, so that waves of movement pass over a ciliated surface in a given direction, similar to what may be seen in a cornfield when the wind is blowing over it. Primitively coating the whole surface of the body evenly, the cilia may become modified and specialized in various ways, which cannot be described in detail here (see Infusoria).

Besides the organs of locomotion already mentioned, there may be present so-called undulating membranes, in the form of thin sheets of ectoplasm which are capable of performing sinuous, undulating movements by their inherent contractility. In some cases distinct contractile threads or myonemes have been described in these membranes. Undulating membranes appear to be formed either by the fusion together of a row of cilia, side by side, or by the attachment of a flagellum to the body by means of an ectoplasmic web, in which case the flagellum forms the free edge of the membrane, as in the genus Trypanosoma.

Returning to the ectoplasm, the excretory function exerted by this layer is seen by the formation in it of the peculiar contractile vacuoles found in most free-living Protozoa. A contractile vacuole is a spherical drop of watery fluid which makes its appearance periodically at some particular spot near the surface of the animal's body, or, if more than one such vacuole is present, at several definite and constant places. Each vacuole grows to a certain size, and when it has reached the limit of its growth it discharges its contents to the exterior by a sudden and rapid contraction. There is, apparently, in most if not in all cases, a definite pore through which the contractile vacuole empties itself to the exterior. On account of the relatively large size which the contractile vacuole attains it bulges inwards beyond the limits of the ectoplasm and comes to lie chiefly in the endoplasm, to which it is sometimes, but erroneously, ascribed. In the most highly differentiated Protozoa, for instance, the Ciliata, the ectoplasm contains an apparatus of excretory channels, situated in its deeper layers, and forming as it were a drainage-system, from which the contractile vacuoles are fed. The fluid discharged by the contractile vacuoles appears to be chiefly water which has been absorbed at the surface of the protoplasmic body, and which has filtered through the protoplasm, taking up the soluble waste nitrogenous products of the metabolism and the gaseous products of respiration; hence the contractile vacuoles may be compared in a general way to the urinary and respiratory organs of the Metazoa.

One of the first consequences of the parasitic habit of life is the disappearance of the contractile vacuoles, which are hardly ever found in truly parasitic Protozoa, that is to say, in forms which live in the interior of other animals and nourish themselves at their expense. They are also very frequently absent in their free-living forms.

Mechanisms of a nervous nature are very seldom found in Protozoa, but in some Ciliata special tactile bristles are found, and it is possible that flagella, and perhaps even pseudopodia, may be sometimes tactile rather than locomotor in function. Pigment-spots, apparently sensitive to light, may also occur in some Flagellata.

The endoplasm, as already stated, is the chief seat of nutritive and reproductive processes. In many Flagellata the ectoplasm
is represented only by the thin envelope or periplast, so that the whole body is practically endoplasm. When the two layers are well differentiated the endoplasm is more fluid and coarsely granular, and contains various organs, chief amongst them in importance being the nucleus, which must be considered specially and may be put aside for the present.

In considering the functions of ingestion and assimilation of food a distinction must be drawn between those Protozoa which absorb solid food-particles, that is to say, which are holozoic in habit, and those which, being holotypic, saprophytic or parasitic in habit, absorb their nourishment in a state of solution. Only in holozoic forms is a special apparatus found for ingestion or digestion of food; in all other forms of nutrition is absorbed by osmosis through the body-wall, presumably at any point of the surface. In holozoic forms we must distinguish further those in which the protoplasm is naked at the surface from those in which the body is clothed by a firm cuticle or cell-membrane. In naked forms food-particles are taken in at any point of the body-surface, either by means of the pseudopodia, or by the action of flagella causing them to impinge upon the surface of the body. In either case the food is absorbed by the protoplasm simply flowing round it and engulfing it, and the food passes into the interior of the body in a tiny droplet of water forming what is termed a food-vacuole. Into the food-vacuole the surrounding protoplasm secretes digestive enzymes, so that each such vacuole represents a minute digestive cavity, in which the food is slowly digested, rendered soluble, and absorbed by the surrounding protoplasm. The insoluble residue of the food is finally rejected by expelling the food-vacuole and its contents from the surface of the body at any convenient point.

The simple process of food-absorption described above for the more primitive naked forms is necessarily modified in detail, though not in principle, in ciliate Protozoa, that is, to say, in forms provided with a cuticle. In the first place, it becomes necessary to have a special aperture for the ingestion of food, a cell-mouth or cytosome. Primitively the cytosome is a simple pore or interruption of the cuticle, but in forms more highly evolved the aperture is prolonged inwards in the form of a tube lined by ectosarc and cuticle, forming a gutlet or oesophagus which ends in the endoplasm. Food-particles are forced by the action of cilia or flagella down the oesophagus and collect at the bottom of it in a droplet of water which, after reaching a certain size, passes into the endoplasm as a food-vacuole in which the food is digested. For rejection of the insoluble residue of the food-vacuoles, a special pore or cell-anus (cytophoge) may be present. In the Ciliata there is often a distinct anal tube visible at all times, but as a rule the anus is only visible at the moment that faecal matter is being ejected from it, though fine sections show that the pore is a constant one.

In the higher Flagellata, on the other hand, the oesophageal ingrowth forms commonly a sort of cloacal cavity, into which the contractile vacuole or vacuoles discharge themselves, and into which also the food-vacuoles evacuate their residues.

Besides the food-vacuoles already described, and the nuclear apparatus presently to be dealt with, the endoplasm may contain various metaplastic products, that is to say, bodies to be regarded as stages in the upward or downward metabolism of the protoplasmic substance. Such substances may take the form of coarse granules of various kinds, crystals, vacuoles or droplets of fatty or oily nature, pigment-grains, and other bodies. In the holophytic Flagellata the endoplasm contains also various organs proper to the vegetable cell, such as chlorophyll-bodies (chloratophores), pyrenoids, grains of a starchy nature (paramyllum), and so forth, which need not be described here in detail.

The nucleus in Protozoa is usually a compact, fairly conspicuous structure, composed of chromatin combined in various ways with an achromatic substance or substances. Sometimes the chromatin is distributed in smaller masses through the nucleus, producing a granular type of nucleus; more often the chromatin is more or less concentrated in a central mass forming a so-called karyosome, consisting of an achromatic plastinoid substance impregnated with chromatin. If the karyosome is large and there is very little chromatin between it and the nuclear membrane, the nucleus is of the type termed vesicular. A nuclear membrane is not, however, always present, and true nucleoli, of the type found in the nuclei of metazoan cells, are not found in Protozoa.

A given individual may have more than one nucleus, and the number present may amount to many thousands, as in the plasmodia of Myctozoa. In such cases the nuclei may be all of one kind, that is to say, not markedly different in size, structure or function, so far as can be seen; or there may be a pronounced morphological differentiation of the nuclei correlated with a difference of function. Thus in the class Infusoria two nuclei are found in each individual; a macronucleus which is somatic in function, that is to say, which regulates the metabolism and vital processes of the body generally, and the micronucleus, which is generative in function, that is to say, which remains in reserve during the ordinary, "vegetative" life of the organism and becomes active during the act of syngamy, after which the effete macronucleus is absorbed or cast out and a new somatic nucleus is formed from portions of the micronuclei which have undergone fusion in the sexual act. Thus the micronucleus of the Infusoria is called in a general way with the germ-plasm of the Metazoan, like which it remains inactive until the sexual union. On the other hand, in some Flagellata a differentiation of the nucleus of quite a different type is seen, a smaller, kinetic nucleus being separated off from the larger, trophic or principal nucleus. The kinetic nucleus has the function, apparently, of controlling the locomotor apparatus, so that the specialization of these two nuclei is of a kind quite different from that seen in the Infusoria.

Besides the nuclear substance which is concentrated to form the principal nucleus or nuclei, there may be present also extranuclear granules of chromatin, so-called chromidia, scattered throughout the whole or some parts of the protoplasmic body. Chromidia may be normally present in addition to the principal nucleus, or may be formed from the principal nucleus during certain phases of the life-cycle. In some cases the entire nucleus may become resolved temporately into chromidia, from which a new nucleus may be formed again later by condensation and concentration of the scattered granules. When the chromidia are numerous and closely packed they may form a so-called chromidial network (Chromidial-Nets). Recent observations on the reproduction of some Sarcodina have shown that the chromidia may possess great importance in the life-cycle as representing generative chromatin which, like the micronucleus of the Infusoria mentioned above, remains in reserve until, by the process of syngamy, the nuclear apparatus is renewed; while the principal nuclei represent, like the macronucleus, somatic or vegetative chromatin which becomes effete and is cast off or absorbed when syngamy takes place. These questions will be discussed further below.

It was formerly supposed that the lowest Protozoa were entirely without a nucleus, and on this supposition E. Haeckel attempted to establish a class named by him Monera, defined as Protozoa consisting of protoplasm alone, in which a nucleus was not differentiated. To this class were referred various organisms whose alleged archaic nature was expressed by such names as Protogenes primordialis, organisms which, like so many other of the primitive forms of animal life described by Haeckel, have been seen by that naturalist alone up to the present. In all Protozoa that have been examined by modern methods a nucleus in some form has been demonstrated to exist, and it must be supposed, until proof to the contrary be forthcoming, that the case of the so-called Monera either the nucleus was overlooked owing to defective technique, or it had been temporarily resolved into chromidia.

The nuclear apparatus may be supplemented by other bodies of which the nature is not always clear. Such is the so-called "Nebenkern" of Paramoeba elhardi, apparently of the nature of a centrosome. Sometimes the karyosome acts like a

PROTOZOA

483
Protozoa

484

CENTROSOOME during the division of the nucleus, and sometimes true centrosomes are present. Flagella also commonly arise from basal granules of a centrosomic nature, blepharoplasts in the correct sense of the term; these blepharoplasts are always in connexion with the nucleus, or with the kinetic nucleus if there is one distinct from the trophic nucleus, as in the genus Trypanosoma and allied forms.

Reproduction of the Protozoa.—The mode of reproduction in these organisms is the same as that of the cell generally, and takes always the form of fission of some kind; that is to say, of division of the body into smaller portions, each of which represents a young individual. The division of the body is preceded by that of the nucleus, if single, or of each nucleus in the cases where there are two different nuclei; if, however, more than one nucleus of the same kind be present, the nuclei may be simply divided in a simple division of the parent nucleus. The mode of division may be different in different nuclei of the same individual; thus, in the Infusoria the macronucleus divides by direct division, the micronucleus by mitosis.

The division of the nucleo in Protozoa may take place by the direct method or by means of mitosis. Direct division, without mitosis, is of very common occurrence; the division may be simple or multiple, that is to say, into only two parts, or into a number of fragments formed simultaneously. An extreme case of multiple fission is seen in the formation of the microgametes of Coccidium schubergi, where the nucleus breaks up into a great number of chromidia, which become concentrated in patches to form the several daughter-nuclei. In some cases, on the other hand, multiple daughter-nuclei are formed by rapidly repeated simple division of the parent nucleus. The mode of division may be different in different nuclei of the same individual; thus, in the Infusoria the macronucleus divides by direct division, the micronucleus by mitosis.

The mitosis of the Protozoa is far from being of the uniform stereotyped pattern seen in the Metazoa, but, as might have been expected, often shows a much simpler and more primitive condition. Centrosomes are often absent, and their place may be taken, as stated above, by other bodies. The nuclear membrane may be retained throughout the mitosis. Definite chromosomes can, as a rule, be made out, but the chromosomes are often very numerous and minute, without definite form, and divide irregularly. Much remains to be done in studying the mitosis of the Protozoa, but it is probable that wider knowledge will show many conditions intermediate between direct division and perfect mitosis.

The simplest method of fission in Protozoa is that termed binary, where the body divides into two halves, which may be equal and similar, so that the result is two sister-individuals impossible to distinguish as parent and offspring. In many cases of binary fission, however, the resulting daughter-individuals may be markedly unequal in size, so that one may be distinguished as the parent, the other as the offspring. If the daughter-individual be relatively very small, and formed in a more or less imperfect condition at first, the process is termed germination or budding. The buds formed in this way may be either external, formed on the surface of the body, or internal, that is, formed in special internal cavities, from which the offspring are later set free, as in many Acinetaria. Germination may be correlated with multiple nuclear fission in such a way that buds are formed over the whole body surface of the organism, which thereby undergoes a process of simultaneous multiple fission into numerous daughter-individuals. Rapid multiple fission of this kind is termed sporulation, and is a form of reproduction which is of common occurrence, especially in parasitic forms. Usually, the central portion of the parent body remains as a residual body (Restkörper), but sometimes the parent organism is entirely resolved into the daughter-individuals, which are termed spores.

1 The kinetic nucleus of Trypanosoma is sometimes, but in the writer's opinion wrongly, named centrosome or blepharoplast; the latter to which, however, by giving these names are chromatic bodies; the kinetic nucleus is a true chromatic nucleus. The question of the centrosome in Protozoa is discussed by R. Goldschmidt and M. Popoff.

In a general way, but can be given special names in special cases (see Gregarines, Coccidia, &c.).

Life-cycles of the Protozoa.—It is probable that in all Protozoa, as in the Metazoa, the life-history takes its course in a series of recurrent cycles of greater or less extent, a fixed point, as it were, in the cycle being marked by the act of syngamy, or conjugation, which represents, apparently, a process for recuperation of the waning vital powers of the organism. It is true that in many types of Protozoa syngamy is not known as yet to occur, but in all species which have been thoroughly investigated syngamy in some form has been observed, and there is nothing to lead to the belief that the sexual process is not of universal occurrence in the Protozoa.

The life-cycle of a given species may be very simple or it may be extremely complex, the organism occurring under many different forms at different phases or periods of its development. The polymorphism of the Protozoa is best considered under three categories, according to the three main causes to which it is due, namely, first, polymorphism due to adaptation to different conditions of existence; secondly, polymorphism due to differences of size and structure during growth; thirdly, polymorphism due to the differentiation of individuals in connexion with the process of syngamy or sexual conjugation.

1. Polymorphism in Relation to Life-conditions.—As a protection against unfavourable conditions, or for other reasons, most Protozoa have the power of passing into a resting condition, during which the vital functions may be wholly or in part suspended. In the resting phase the animal usually becomes enveloped in a resistant membrane or cyst secreted by it, and is then said to be encysted. The formation of a cyst may be a response to conditions of various kinds. Very commonly it is formed to protect the organism against a change of medium, as in the case of freshwater forms liable to desiccation, or of parasites about to pass out of the bodies of their hosts. In other cases the organism passes into the resting state in order to absorb ingested nutriment or in order to enter upon reproductive phases.

As a preparation for encystment, organs of locomotion, if present, are retracted or cast off; contractile vacuoles cease to be formed; and the food-vacuoles disappear, usually by digestion of their contents and rejection of the waste residue. The body becomes rounded off and more or less spherical in form, and the protoplasms becomes denser, that is, less fluid and more opaque, but at the same time of diminished specific gravity, by loss of water. The cyst is then secreted at the surface as a layer of varying thickness and toughness. In the encysted condition many Protozoa are capable of being transported by the wind, a fact which explains their appearance in infusions and liquids exposed to the air. In favourable conditions the cysts germinate, that is to say, the envelope is dissolved and the contained organism or organisms are set free to enter upon the strenuous life once more.

In the Mycetozoa, organisms adapted to a semi-terrestrial life in moist surroundings, the protoplasms is capable, when desiccated, of passing into a tough condition resembling sealing-wax, which, when moistened, assumes again its normal appearance and active condition.

Resting phases, analogous to encystment, are seen in the spores of various Protozoa, especially those of parasitic habit which are commonly enclosed in tough, resistant envelopes or sporocysts, and enveloped as a protection against change of medium or of host. Within the sporocyst multiplication of the sporocyst may take place to form more or fewer sporozoids. The sporocysts usually show definite symmetry and structure, infinitely variable in different species. In a suitable medium the spores germinate by rupture of the sporocyst and escape of the contents.

2. Polymorphism in Relation to Growth and Development.—In many species of Protozoa there is hardly any difference to be observed between different individuals during their active phases except in size. Those individuals about to multiply by fission are slightly above the normal in dimensions; on the
of frequent occurrence in many forms of Protozoa. The
individuals whose nuclei undergo fusion are termed gametes.
They may be in no way different from each other or from ordinary
individuals of the species, or, on the other hand, they may be
highly differentiated in size, form and structure. The two
gametes may undergo complete fusion into one body, thus
giving rise to an individual termed generally a zygote or copula,
but which may bear special names in special cases (e.g. vermicule or
ökiknete of the malarial parasites, &c.); such a process is
termed sometimes copulation. On the other hand, the bodies of
the two gametes may remain distinct, and portions of
the nucleus of each be exchanged between them; to this condition
the term conjugation is sometimes specially applied. The act
of syngamy may be performed in the free condition, or in the
resting state, within a cyst.

The significance of syngamy has been much discussed, and it is
easy to make positive statements upon this point. By comparing
the life-cycles of different forms it is found that
syngamy sometimes precedes, sometimes follows, a period
of great reproductive activity on the part of the organism. Thus
in such a form as Noctiluca, syngamy between two full-grown
individuals is followed by rapid sporulation and the production
of a swarm of young individuals; on the other hand, in Foramini-
fera and Radiolaria, rapid sporulation of adult individuals
produces a numerous progeny of young forms which may go
through the process of syngamy and produce zygotes that simply
grow into the adult form. Comparing these two types of develop-
ment, instances of which might be greatly multiplied, it is seen
that in one case syngamy follows a period of growth and precedes
a period of proliferation in the life-cycle, and that in the other
case exactly the reverse is true. Hence it follows that
syngamy must not be regarded as in any wajy specially connected
with reproduction, but must be considered in its relation to the
life-cycle as a whole, and in those instances in which syngamy is
followed by increased reproductive activity the explanation
must be sought in the general physiological effects of the sexual
process upon the vital powers of the organism.

In the Metazoan the sexual process is always related to the
production of a new individual, that is to say, of a multicellular
organism for which there is no analogy amongst the Protozoa,
although an approach to the Metazoan condition is seen in
the colony-forming Flagellata, such as Volvox and its allies.
The reproduction of Protozoa is analogous to the ordinary process
of cell-division and multiplication which is going on at all times in
the bodies of the Metazoan, and which can be observed in the pro-
duction of the gametes; that is to say, in the period of the life-
cycle immediately preceding the sexual process in the Metazoan,
just as much as in the developmental phases which follow
syngamy and result in the building up of a new Metazoan individual.
Hence, so far as the Protozoa are concerned, the phrase "sexual
reproduction" is an incongruous combination of words; repro-
duction and sex are two distinct things, not necessarily related
or in any direct causal connexion; and in order to arrive at
any theory of reproduction it is necessary to clear away all
misconceptions or preconceived notions arising from analogies
with the multicellular Metazoan individual.

Many observations indicate that the vital powers of the
Protozoa become gradually weakened, and the individual tends
to become senile and effete, unless the process of syngamy
intervenes. The immediate result of the sexual union is a
renewal of the vitality, a rejuvenescence, which manifests itself
in enhanced powers of metabolism, growth and reproduction.
These facts have been most studied in the Ciliata. It is observed
that if these organisms be prevented from conjugating with
others of their kind they become senile and finally die off. It
has been found by G. N. Calkins, however, that if the senile
individuals be given a change of medium and nourishment,
their vigour may be renewed and their life prolonged for a time,
though not indefinitely; there comes a period when artificial
methods fail and only the natural process of syngamy can enable
them to prolong their existence. The results obtained by Calkins
are of great interest, as indicating that under special conditions

1 It will be shown below, however, that in some species syngamy
may perhaps be secondary in abevance.
of the environment the necessity for the sexual process may be diminished and the event may be deferred for a long time, if not indefinitely. Hence it is quite possible that in many Protozoa the process of syngamy may be in abeyance, just as there are cuttings which can be propagated indefinitely by suckers or cuttings without ever setting seed; and it is possible that the incomplete or artificial transmission of parasitic Protozoa from one host to another, as in the case of pathogenic trypanosomes, without any apparent diminution in their vital powers, is an instance of this kind.

As a general rule, in order that syngamy may be attained by beneficial results to the organism, it is necessary that the two conjugating individuals should be from different strains, that is to say, they should not be nearly related by descent and parentage. Thus F. Schaudinn found that in order to observe the sexual union of the gametes of Foraminifera it was necessary to bring together gametes of distinct parentage. On the other hand it has been observed that in many Protozoa, especially in parasitic forms, syngamy takes place between individuals of common parentage. Thus in Ameoba coli, according to F. Schaudinn, a single individual becomes encysted and its nucleus divides into two; after each nucleus has undergone certain maturative changes they give rise to pronuclei which conjugate and initiate a new developmental cycle. Syngamy between sister individuals, or autogamy, as it has been termed, is not, however, confined to parasitic Protozoa; it has been observed in Actinosphaerium by R. Hertwig. The benefit to the organism, if any, arising from autogamy can only be supposed to result from the rearrangement and reconstitution of the nuclear apparatus. The frequent occurrence of autogamy suggests that in many Protozoa the nature of the environment diminishes the importance of the sexual process, at least so far as the mixture of nuclear material from distinct sources is concerned; and, since autogamy is most common in parasitic forms, this result may, in the light of G. N. Calkins's experiments, be ascribed in great part to the frequent changes of environment and nutrition to which parasitic forms, above all, are subject.

True syngamy consists, as has been said, of nuclear fusion or karyogamy. It rarely, if ever, happens, however, that such fusion takes place without the conjugating nuclei having undergone some process of reduction by elimination of a portion of the nuclear substance, in a manner analogous to the maturations of the germ-cells in the Metazoa. The chromatin thus eliminated may be cast out from the body of the organism as one or more so-called polar bodies; or may be absorbed in the cytoplasm; or may remain in the cytoplasm and be left over in the residual protoplast. The process of syngamy is followed by a process of rapid multiplication by sporulation; but in all cases the chromatin removed from the nucleus is rejected in some way or other and plays no part in the subsequent development of the organism. The nuclei of the gametes which have completed this process of élation naire are then ripe for syngamic fusion and are termed pronuclei; the union of two pronuclei produces a single nucleus termed a synkyaryon.

It is certain that in many, if not in all, cases the nuclear substance that is rejected as a preliminary to syngamy consists of somatic or vegetative chromatin; that is to say, of chromatin that has been functional in regulating the ordinary vital functions, metabolism, growth, reproduction, &c., during previous generations, and has become effete; while on the other hand the chromatin that persists to form the pronuclei is generative chromatin which has remained in reserve for the sexual act and has retained its peculiar powers and properties unimpaired.

The truth of this explanation is extremely obvious in such forms as the Infusoria, where somatic and generative chromatin are concentrated into two distinct and entirely separate nuclei. In some Rhizopoda also the body contains one or more principal nuclei and a mass of chromidia, and it has been observed that as a preparation for syngamy the principal nuclei are eliminated and the pronuclei are formed from the chromidia; in such cases, therefore, it is reasonable to regard the principal nuclei as representing somatic chromatin, the chromidia as generative chromatin. In other cases, however, for example Actinosphaerium, the chromidia must be interpreted, from their behaviour, as somatic chromatin, and the principal nuclei as generative chromatin; hence R. Goldschmidt has proposed the special term sporidia for those chromidia which represent reserve generative chromatin. In the majority of Protozoa, however, the nuclear substance is not differentiated in such a way that it can be distinguished by any visible peculiarities into somatic and generative chromatin.

The process of reduction is not limited, apparently, to the elimination of somatic chromatin, but a portion of the generative chromatin is also cast off. Thus in the Infusoria not only the somatic macronucleus, but also a considerable portion of the generative micronucleus, is absorbed at each act of conjugation. The elimination of generative chromatin is perhaps of importance as a factor in heredity and the production of variations, or possibly for sex determination, as will be discussed below; it is difficult to suggest any other explanations for it, unless it be supposed that during the exercise of ordinary vital functions a portion of the generative chromatin be rendered effete as well as the somatic chromatin.

From the considerations set forth in the foregoing paragraphs it must be supposed that the synkyaryon, the fusion-product of the two pronuclei in syngamy, consists at first purely of generative chromatin, which must speedily become differentiated into the regulative somatic chromatin of the ensuing generations and the generative chromatin held in reserve for the next act of syngamy. Such a differentiation can be actually observed in the Infusoria, where immediately after conjugation the synkyaryon divides into one or more pairs of nuclei, each pair becoming the two unequally sized nuclei of an ordinary individual, sometimes with, even at this stage, an apparently wanton elimination of nuclear substance. Thus the somatic and generative chromatin of the Protozoa offer a certain analogy with the soma and germ-plasm of Metazoa; but in making such comparisons the distinction between a physiological analogy and a morphological homology should be borne clearly in mind.

It has been stated above that the two gametes of a given species of Protozoa may be perfectly similar and indistinguishable, or may be very different one from the other. The condition with similar gametes is termed isogamy, that with differentiated gametes anisogamy. Every transition can be found from complete isogamy and pronounced anisogamy in the Protozoa; in tracing, however, the evolution of specialized gametes it must be remembered that we are dealing only with visible morphological differences mainly of an adaptive nature, without prejudice to the question of the possible existence of mental sexual antithesis in all gametes, present even when not perceptible. The sex philosopher O. Weininger has urged that sex is a fundamental attribute of living things, and that the living substance, protoplasm, consists of arrenoplasms and thelyplasms united in varying proportions. Certain observations of F. Schaudinn tend to support this view; in Trypanosoma nocturnae, for example, Schaudinn found that the process of reduction in one gamete took an opposite course to that which it took in the other gamete. In one gamete certain portions of the nucleus were retained and certain other portions rejected; in the maturation of the other gamete the portions rejected and the portions retained were the reverse. Hence Schaudinn was led to regard the indifferent individuals as essentially hermaphrodite in nature, and therefore capable of giving rise to gametes of either order by elimination of one or the other set of sexual elements; the process which it is possible to influence by the elimination of generative chromatin mentioned above. It is possible, therefore, that the gametes of Protozoa may possess sexual characters intrinsically different even when perfectly similar so far as can be perceived. It is very probable, for instance, that the isogamy in Gregarines is a state of things derived secondarily from a primitive condition of anisogamy (see Gregarines).

The simplest possible condition of the gametes is seen in the free-swimming Ciliata, forms which in other respects are the
most highly organized of Protozoa; here the individuals which conjugate are only distinguished from ordinary individuals of the species by the fact that their nuclei have undergone very complicated processes of reduction and nuclear elimination. In these forms there is also no difference between young and adult individuals, beyond scarcely perceptible differences of size between individuals about to divide and those that are the products of recent division, so that these species are practically monomorphic in the active condition. In forms, however, which, like Vorticella, are of sessile habit, small free-swimming individuals are liberated which seek out and conjugate with the ordinary sessile individuals. Here we have an instance of a morphological differentiation of the gametes which is clearly adaptive to the life-conditions of the species. In other Protozoa there may be, as already stated, differences, more or less pronounced, between young and adult individuals, and syngamy may take place either between young individuals (microgammy) or between adults (macrogamy); the gametes may be in either case ordinary individuals of the species, not specially differentiated in any way, or on the other hand they may be differentiated from ordinary individuals, while still similar and isogamic amongst themselves; or, finally, they may be anisogamic; that is to say, differentiated into two distinct types. Thus in the Radiolaria, for example, an adult individual breaks up by a process of sporulation into numerous minute flagellated swarm-spores; these may be all of one kind, termed isospores, which develop directly without undergoing syngamy; or they may be of two kinds, termed anisospores, both different in their character from the isospores, and incapable of development without syngamy.

When the gametes are differentiated the divergence between them almost always follows parallel paths. One gamete is distinguished by its smaller size, its greater activity, and its comparative poverty in granules of reserve food-material; hence it is termed the microgamete. The other gamete, distinguished by its greater bulk, its pronounced sluggishness and inertness, and its tendency to form and store up in the cytoplasm reserve nutriment of one kind or another; hence it is termed the macrogamete, or, as some prefer to write it, the megagamete (better megadogamete). When these differences are very pronounced, as, for instance, in the Coccidia and other Sporozoa, a condition is reached which is practically indistinguishable from that seen in the sperm and ova of the Metazoa. Hence the microgamete is generally regarded as male, the macrogamete as female; and these terms may be conveniently used, although they do not in themselves imply more than would the words positive and negative, or any other pair of terms expressive of a fundamental contrast. The microgamete may become reduced to a mere thread of chromatin, which may possess one or two flagella for purposes of locomotion, as in Coccidia, &c., or may move by serpentine movements of the whole body, which resembles in its entirety a flagellum, and is often wrongly so termed. In contrast with the microgamete, its correlate, the macrogamete, tends to become a bulky, inert body, often with great resemblance to an ovum, its cytoplasm dense and granular, packed with reserve food-materials as an egg contains yolk, and without organs of locomotion or capacity for movement of any kind. Hence the macrogamete is the passive element in syngamy, which requires to be sought out and "fertilized" by the active microgamete, a division of labour perfectly analogous to that seen in the male and female gametes of Metazoa. In those cases where syngamy takes place by interchange of nuclear substance between two gametes which remain separate from one another, as in the Infusoria, each gamete forms two pronuclei, which are distinguished by their behaviour as the active and passive pronuclei respectively. The active pronucleus of each gamete passes over into the body of the other and fuses with its passive pronucleus to form a syncaryon. A similar method of procedure occurs also in Amoeba coli, according to F. Schaudinn.

When gametes are not very highly specialized they may still retain the power of multiplication by division possessed by ordinary individuals, so long as they have not undergone the process of nuclear reduction preliminary to syngamy. If, however, the gametes are highly specialized they may forfeit the power of multiplication. In this respect the microgametes are worse off than the other sex; on account of the great reduction of the body-protoplasm, and the entire absence of any reserve materials, they must either fulfil their destiny as gametes or die off. The macrogametes, on the other hand, with their great reserves of cytoplasm and nutriment, are more hardly than any other forms of the species, and are able to maintain their existence in periods of famine and starvation when all other forms are killed off. Moreover they may regain the power of multiplication by a process of parthenogenesis, a term originally applied in the Metazoa to cases where a germ-cell of definitely female character, that is to say an ovum, acquires the power of reproduction without fertilization by syngamy. A macrogamete multiplying by parthenogenesis first goes through certain nuclear changes whereby it is set back, as it were, from the female to the indifferent condition, and it is then able to multiply by fusion like any ordinary, non-sexual individual of the species. Parthenogenesis has been described by F. Schaudinn in the malarial parasites and in Trypanosoma noctuae. In both cases the female forms are able to persist under adverse conditions after all other forms have perished, and then by parthenogenesis they may multiply when conditions are more favourable, overrun the host again, and cause a relapse of the disease of which they are the cause. S. v. Prowazek has described in Herpetomonas muscae-domesticae an analogous process of multiplication on the part of male individuals, and has coined the term theogenesis for this process, but the statement needs confirmation, and as a general rule the microgamete is quite incapable of independent reproduction under any circumstances.

It is often found that not only are the gametes differentiated, but that their immediate progenitors may also exhibit characters which, in the more general and undifferentiated forms of the species, are more or less conspicuous. In such cases the parent-forms of the gametes are termed gametocytes, and they may differ amongst themselves in characters which render it possible to distinguish those destined to produce microgametes from those which will produce the other sex. The parent-individuals of the microgametes, or microgametocytes, are distinguished as a general rule by clearer protoplasm, free from coarse granulations, and a larger nucleus, more rich in chromatin. The macrogametocytes, on the other hand, usually have coarsely granular cytoplasm, rich in reserve food-stuffs, and a relatively small nucleus. The gametocytes produce the gametes by methods that vary according to the degree of specialization of the gametes. In isogamous forms, of which good examples are furnished by many Gregarinæ (p. 498), the gametes are produced by a process of sporulation on the part of the gametocytes, a certain amount of residual protoplasm being left over. In forms with pronounced anisogamy, for instance, Coccidia or Haemosporinia, the microgametes are produced by sporulation in which almost the whole mass of the body of the gametocyte may be left over as residual protoplasm, together with some portion of the nucleus; in the other sex, however, the process of sporulation may be altogether in abeyance, and the macrogametocyte becomes simply converted into the macrogamete after going through a process of nuclear reduction.

The gametocytes may, however, possess the power of multiplication without change of character for many generations; or, to put the matter in other words, the sexual differentiation may be apparent not merely in the generation immediately preceding the gametes, but in many generations prior to this. Thus a given species may consist of three different types of adult individuals, male, female and indifferent, each multiplying in its own line. Complicated alternations of generations are the result, and if at the same time there is a well-marked difference between young and adult forms of the species, the height of polymorphism is reached. Very commonly a double series of generations occurs, the non-sexual or indifferent forms multiplying apart from the sexually differentiated individuals and the generations immediately descended from them; in such cases the
series of non-sexual generations is termed schizogony, the series of sexual generations gametogony or sporogony. Schizogony and sporogony usually occur as adaptations to, or at least in relation with, distinct conditions of life. Thus in parasitic forms, as well illustrated by the Coccidia, the organisms multiply by schizogony when overrunning the host, that is to say, when nutrition is abundant; sporogony begins as a preparation for passing into the outer world, in order to infect new hosts. In the Haemo-
sporidia, in which transmission from one vertebrate host to another is effected by means of blood-sucking ectoparasites (Diptera, ticks, leeches, &c.), the schizogony goes on in the vertebrate host, the sporogony in the invertebrate host. In free-living, non-parasitic forms, schizogony may go on under ordinary conditions, while sporogony supervenes as a preparation for a marked change in the life-conditions; for instance, a change of medium, at the approach of winter. It is interesting to note that, as a general rule, the differentiation of sexual forms seems to be a preliminary to the production of more resistant forms capable of braving adverse conditions or violent changes in the conditions of life; a phenomenon which is in support of the hypothesis that syngamy has a strengthening effect on the vitality of the species.

**Classification of the Protozoa.**

Various attempts have been made to separate the Protozoa into two primary subdivisions. E. Ray Lankester divided them into two main groups, the Gymnomyzacs, with naked protoplasm and indefinite form, and the Coricata, with the protoplasm limited by a firm membrane, and consequently with a definite body-form. In many of the coricate groups, however, there must be placed amoeboid, non-corticate forms, such as *Mastig amoeba* amongst the Flagellata, or the malarial parasites amongst the Sporozoa. Hence if Lankester's classification be used, it must be without a hard and fast verbal definition. F. Dobien, on the other hand, has divided the Protozoa into Plasmodroma, with organs of locomotion derived from protoplasmic processes, i.e. pseudopodia or flagella, and Ciliophora, with locomotion by cilia. It may be doubted, however, if the distinction between flagella and cilia is so fundamental and sharply defined as this mode of classification would imply. W. H. Jackson has proposed to unite the forms bearing flagella and cilia into one section, Plegepoda, and distinguishes two other sections, Rhizopoda (=Sarcodina) and Endoparasita (=Sporozoa).

Four main groups are thus named in the Protozoa of classes, are universally recognized, however they may be combined into larger categories; these are the Sarcodina, Mastigophora, Sporozoa and Infusoria.

The Sarcodina are characterized by the body being composed of naked protoplasm, not covered by any limiting cuticle, although in many cases a house or shell is secreted into which the protoplasm can be partly or entirely withdrawn. No special organs of locomotion, either flagella or cilia, are ever present in the adult, and locomotion and capture of food are effected in the manner named amoeboid, by more or less temporary extrusions or outflow of the protoplasm which are termed pseudopodia, as in *Ameba*.

The Mastigophora are characterized because organs of locomotion are always present in the adult in the form of one or more flagella, each flagellum (Gr. *pàrasti*; whip) a delicate, thread-like extension of the protoplasm, endowed with a special contractility which enables it to perform lashing, whip-like movements. The body protoplasm is sometimes naked, in which case it may be amoeboid, but is more usually limited by a cuticle, varying in thickness in different types.

The Sporozoa, with the exception of a few forms of dubious position, are exclusively internal parasites of Metazoa, absorbing their food from the internal juices and secretions of their hosts, and never exhibiting in their trophic phases any organs of locomotion or for the ingestion and digestion of solid food. The body-protoplasm may be naked and amoeboid or limited by a cuticle. The reproduction is specialized in correlation with the parasitic habit, and results typically in the formation of a number of minute germs or spores, by which the infection of fresh hosts is effected. It must not be supposed, however, that spore-formation is confined to this class of Protozoa.

The Infusoria, a name originally of much wider application, is now restricted to denote those Protozoa in which locomotion or capture of food is effected by means of special organs termed cilia, minute hair-like contractile extensions of the protoplasm differing from flagella not only in their usually smaller size and greater number, but also in the mode of contraction and movement. The cilia may be present throughout life or only in an early stage of the individual. The body is always limited by a cuticle and the nucleus seems to be invariably double, being divided into two parts specialized in function and differing in size, termed respectively macronucleus and micronucleus.

Comparing these four subdivisions with one another, it may be said at once that the Sporozoa and Infusoria are highly specialized classes, each well marked off from the other subdivisions. The Sarcodina and Mastigophora, on the other hand, include the most primitive types of Protozoa and are delimited from one another by a somewhat arbitrary character, the presence or absence of a flagellum in the adult. Thus *Mastigamoeba* is a form which unites the characters of the Sarcodina and Mastigophora, having an amoeboid body which bears a flagellum, and it is classed among the Mastigophora merely because the flagellum is retained throughout life; if the flagellum were absent in the adult condition it would be placed among the Sarcodina, many of which have flagella in their young stages but lack them when adult. Hence Bütschli considered the Rhizomastigina (i.e. *Mastigamoeba* and its allies) as the most primitive group of Protozoa, representing the common ancestral form of all the classes; and on this view the flagellated young stages of many Sarcodina would represent recapitulative larval stages.

Bütschli's theory of Protozoa phylogeny implies that a flagellum is an organ of most primitive nature, possessed perhaps by the earliest forms of life; and it must be remembered that flagella are borne by many Bacteria. On the other hand, one would imagine, from general considerations, that living beings possessing a flagellum would have been preceded in evolution by others that did not bear so definite an organ. The flagellum itself is generally regarded as a vibratile process or extension of the protoplasm, comparable in its nature to a slender pseudopodium endowed with peculiar powers of movement. More generally with the protozoans, the nature and formation of the flagellum is needed in order to decide this point, and particularly with regard to the question whether the flagella of Bacteria are of the same nature as those of Protozoa.

It has been much debated whether the earliest forms of life were of the nature of plants or animals. Many authors consider the question settled beyond all debate by a process of trenchant deductive reasoning. It is argued that animals require other organisms for their nutrition, and that plants, that is to say green plants, do not; therefore plants must have preceded animals. On the other hand, the morphologist will urge that green plants derive their peculiar powers of metabolism from the possession of very definite cell-organs, namely chromato-
phores containing chlorophyll; and will argue that living things of one or another of the modes of metabolism of the possessing them. The whole dispute is based on the assumption that plant and animal represent the two fundamental modes of metabolism; whereas the study of the Bacteria shows the possibility of many other modes of life. Many Bacteria exhibit processes of metabolism totally different from those generally laid down in textbooks as characteristic of living matter; some are killed by free oxygen; others can absorb free nitrogen, and various other "abnormal" properties are mani-

fested by them. Hence the primitive organisms may have been neither plant nor animal in their nature, but may have possessed, like the Bacteria at present, many different methods of metabolism from which plant and animal are two divergent paths of evolution.

The origin of life is veiled in a mist which biological knowledge...
in its present state is unable to dispel; and speculations with regard to the nature of the earliest form of life are as yet premature and futile.

The following references are either general treatises on the Protozoa, or memoirs dealing with special points in a general manner.

**PROUDHON, PIERRE JOSEPH** (1809-1865), French socialist and political writer, was born on the 15th of January 1809 at Besançon, France, the native place also of the socialist Fourier. His origin was of the humblest, his father being a brewer’s cooper; and the boy herded cows and followed other simple pursuits of a like nature. But he was not entirely self-educated; at sixteen he entered the college of his native place, though his family was so poor that he could not procure the necessary books, and had to borrow them from his mates in order to copy them. He was a student of law in the University of his native country, and afterwards he rose to be a corrector for the press, reading proofs of ecclesiastical works, and thereby acquiring a very competent knowledge of theology. In this way also he came to learn Hebrew, and to compare it with Greek, Latin and French; and it was the first proof of his intellectual audacity that on the strength of this he wrote an *Essai de grammaire générale*. As Proudhon knew nothing whatever of the true principles of philology, his treatise was of no value. In 1838 he obtained the *pension Suard*, a bursary of 150 francs a year for three years, for the encouragement of young men of promise, which was in the gift of the academy of Besançon. In 1839 he wrote a treatise *L’Utilité de la célébration du dimanche* which contained the germs of his revolutionary ideas. About this time he went to Paris, where he lived a poor, ascetic and studious life—making acquaintance, however, with the socialist ideas which were then fomenting in the capital. In 1840 he published his first work *Qu’est-ce que la propriété?* His famous answer to this question, "La propriété, c’est le vol" (property is theft), naturally did not please the academy of Besançon, and then the son of a poor tailor, who had to sell his work for his education, was published for the regular period. For his third memoir on property, which took the shape of a letter to the Fourierist, M. Considérant, he was tried at Besançon but was acquitted. In 1846 he published his greatest work, the *Système des contradictions économiques ou philosophie de la misère*. For some time Proudhon carried on a small printing establishment at Besançon, but without success; afterwards he became connected as a kind of manager with a commercial firm at Lyons. In 1847 he left this employment, and finally settled in Paris, where he was now becoming celebrated as a leader of innovation. He regretted the sudden outbreak of the revolution of February (1848), because it found the social reformers unprepared. But he threw himself with ardour into the conflict of opinion, and soon gained a national notoriety. He was the moving spirit of the *Représentant du peuple* and other journals, in which the most advanced theories were advocated in the strongest language; and as member of assembly for the Seine department he brought forward his celebrated proposal of exacting an impost of one-third on interest and rent, which of course was rejected. His attempt to found a bank which should operate by granting gratuitous credit was also a complete failure; of the five million francs which he required only seventeen thousand were offered. The violence of his utterances led to an imprisonment at Paris for three years, during which he married a young working woman. As Proudhon aimed at economic rather than political innovation, he had no special quarrel with the second empire, and he lived in comparative quiet under it till the publication of his work, *De la Justice dans la révolution et dans l’église* (1858) in which he attacked the Church and other existing institutions with unusual fury. This time he fled to Brussels to escape imprisonment. On his return to France his health broke down, though he continued to write. He died at Passy on the 16th of January 1865.

Personally Proudhon was one of the most remarkable figures of modern France. His life was marked by the severest simplicity and even Puritanism; he was affectionate in his domestic relations, a most loyal friend, and strictly upright in conduct. He was strongly opposed to the prevailing French socialism of his time because of its utopianism and immorality; and, though he uttered all manner of wild paradox and vehement invective against the dominant ideas and institutions, he was remarkably free from feelings of personal hate. In all that he said and did he was the son of the people, who had not been broken to the usual social and academic discipline; hence his roughness, his one-sidedness, and his exaggerations; but he is always vigorous, and often brilliant and original.

It would of course be impossible to reduce the ideas of such an irreligious thinker to systematic form. In later years Proudhon himself confessed that "the great part of his publications formed only a work of dissipation and ventilation, so to speak, by means of which he slowly makes his way towards a superior conception of political and economic laws. On the whole, the whole of his teaching is clear and firm; no one could insist with greater emphasis on the demonstrative character of economic principles as understood by himself. He strongly believed in the absolute truth of a few moral ideas, with which it was the aim of his teaching to mould and suit the political economy. Of these fundamental ideas, justice, liberty and equality were the chief. What he desired, for instance, in an ideal society was the most perfect equality of remuneration. It was his principle that service pays service, that a day’s labour balances a day’s labour—in other words, that the duration of labour is the just measure of value. He did not shrink from any of the consequences of this theory, for he would give the same remuneration to the worst mason as to a Phidias; but he looks forward also to a period in human development when the present inequality in the talent and capacity of men would be reduced to an inappreciable minimum. From the great principle of service as the equivalent of service is derived his axiom that property is the right of *aubaine*. The *aubaine* was a stranger not naturalized; and the right of *aubaine* was the right in virtue of which the sovereign, from the earliest monarchy, should derive all property which he had died in his territory.1 Property is a right of the same nature, with a like power of appropriation in the form of rent, interest, &c. It reaps without labour, consumes without producing, and enjoys without exertion. Proudhon’s aim, therefore, was to realize a science of society resting on principles of justice, liberty and equality thus understood; "a science absolute, rigorous, based on the nature of man and of his faculties,

1 The droit d’*aubaine* was abolished in 1790, revived by Napoleon, and ended in 1819.
PROUST, A.—PROUT, S.

and on their mutual relations; a science which we have not to invent, but to discover.” But he saw clearly that such ideas with their necessary accompaniments could only be realized through a long and laborious process of social transformation. He strongly detested the pruriens-immorality of the schools of Saint-Simon and Fourier. He attacked them not less bitterly for thinking that society could be changed off-hand by a ready-made and complete scheme of reform. It was “the most accursed lie,” he said, “that could be offered to mankind.” In social change he distinguishes between the transition and the perfection or achievement. With regard to the transition he advocated the progressive abolition of the right of aubaine, by reducing interest, rent, &c. For the goal he professed only to give the general principles; he had no ready-made scheme, no utopia. The positive organization of the new society in its details was a labour that would require fifty Montesquieux. The organization he desired was one on collective principles, a free association which would take account of the division of labour, and which would maintain the personality both of the man and the citizen. With his strong and fervid feeling for human dignity and liberty. Proudhon could not have tolerated any theory of social change that did not give full scope for the free development of man. Connected with this was his famous paradox of anarchy, as the goal of the free development of society, by which he meant that through the ethical progress of men government should become unnecessary. “Government of man by man in every form,” he says, “is oppression. The highest perfection of society is found in the union of order and anarchy.” Proudhon, indeed, was the first to use the word anarchy, not in its revolutionary sense, as we understand it now, but as he himself says, to express the highest perfection of social organization.

Proudhon’s theory of property as the right of aubaine is substantially the same as the theory of capital held by Marx and most of the later socialists. Marx, however, always greatly detested Proudhon and his doctrines, and attacked him violently in his Misère de la philosophie. Property and capital are defined and treated by Proudhon as the power of exploiting the labour of other men, of claiming the results of labour without giving an equivalent. Proudhon’s famous paradox, “la propriété, c’est le vol,” is merely a trenchant expression of this general principle. As slavery is assassination inasmuch as it destroys all that is valuable and desirable in human personality, so property is theft inasmuch as it appropriates the value produced by the labour of others without rendering an equivalent. For property Proudhon would substitute individual possession, the right of occupation being equal for all men.

A complete edition of Proudhon’s works, including his posthumous writings, was published at Paris (1875). See also P. J. Proudhon, lettres et sa correspondance, by Sainte-Beuve (Paris, 1875); Beauchêne, Economie sociale de P. J. Proudhon (Lille, 1867); Spoll, P. J. Proudhon, étude biographique (Paris, 1867); Marchegay, Silhouette de Proudhon (Paris, 1868); Puthitz, P. J. Proudhon, sein Leben und seine positiven Ideen (Berlin, 1881); Dichtel, P. J. Proudhon, seine Lehre und sein Leben (Jena, 1888-1889); Mülberger, Studien über Proudhon (Stuttgart, 1891); Desjardins, P. J. Proudhon, sa vie, ses œuvres et sa doctrine (Paris, 1896); Mülberger, P. J. Proudhon (Stuttgart, 1899).

PROUST, ANTONIN (1832-1905), French journalist and politician, was born at Niort on the 15th of March 1832. He founded in 1864 an anti-imperial Journal, La Semaine hebdomadaire, which appeared at Brussels. He was war correspondent of Le Temps in the early days of the Franco-German War, but after Sedan he returned to Paris, where he became secretary to Gambetta and superintended the refugees in Paris. He entered the Chamber as deputy for his native town in 1876, taking his seat on the left. In Gambetta’s cabinet (1881-1882) he was minister of the fine arts, and in the Chamber of Deputies he was regularly commissioned to draw up the budget for the fine arts, after the separate department had ceased to exist. Prosecuted in connexion with the Panama scandals, he was acquitted in 1893. From this time he lived in the closest retirement. On the 20th of March 1905 he shot himself in the head, dying of the wound two days later.

PROUST, JOSEPH LOUIS (1754-1826), French chemist, was born on the 26th of September 1754 at Angers, where his father was an apothecary. After beginning the study of chemistry in his father’s shop he came to Paris and gained the appointment of apothecary in chief to the Salpêtrière, also lecturing on chemistry at the musée of the aeronaut J. F. Pilâtre de Rozier, whom he accompanied in a balloon ascent in 1784. Next, at the instance of Charles IV., he went to Spain, where he taught chemistry first at the artillery school of Segovia, and then at Salamanca, finally becoming in 1789 director of the royal laboratory at Madrid. In 1808 he lost both his position and his money by the fall of his patron, and retired first to Craon in Mayenne and then to Angers, where he died on the 5th of July 1826. His name is best known in connexion with a long controversy with C. L. Berthollet. The latter chemist was led by his doctrine of mass-action to deny that substances always combine in constant and definite proportions. Proust, on the other hand, maintained that compounds always contain definite quantities of their constituent elements, and that in cases where two or more elements unite to form more than one compound, the proportions in which they are present vary per saltum, not gradually. In 1799 he proved that carbonate of copper, whether natural or artificial, always has the same composition, and later he showed that the two oxides of tin and the two sulphides of iron always contain the same relative weights of their components and that no intermediate indeterminate compounds exist. His analytical skill enabled him to demonstrate the inaccuracy of the researches by which Berthollet attempted to support the opposite view, and to show among other things that some of the compounds which Berthollet treated as oxides were in reality hydrates containing chemically combined water, and the upshot was that in 1808 he had fully vindicated his position. Proust also investigated the varieties of sugar that occur in sweet vegetable juices, distinguishing three kinds, and he showed that the sugar in grapes, of which he announced the existence to his classes at Madrid in 1799, is identical with that obtained from honey by the Russian chemist J. T. Lowitz (1757-1804).

Besides papers in scientific periodicals he published Indagaciones sobre el estañada de cobre, la vejiga de estauo y el vidriado (1803); Memoire sur le suet de raisins (1808); Recueil des memoires relatifs à la poudre à canon (1815); and Essai sur les causes qui peuvent amener la formation du calcaire (1824).

PROUSTITE, a mineral consisting of silver sulpharsenite, Ag₂As₂S₄, known also as light red silver ore, and an important source of the metal. It is closely allied to the corresponding sulphantimonite, pyrrargyrite, from which it was distinguished by the chemical analyses of J. L. Proust in 1824, after whom the mineral received its name. Many of the characters being so similar to those of pyrrargyrite (q.v.) they are mentioned under that species. The prismatic crystals are often terminated by the scalenohedron {201} and the obtuse rhombohedron {110}, thus resembling calcite (dog-tooth-spar) in habit. The colour is scarlet-vermilion and the lustre adamantine; crystals are transparent and very brilliant, but on exposure to light they soon become dull black and opaque. The streak is scarlet, the hardness 2½, and the specific gravity 5-57. The mode of occurrence is the same as that of pyrrargyrite, and the two minerals are sometimes found together. Magnificent groups of large crystals have been found at Chacarillo in Chile; other localities which have yielded fine specimens are Freiberg and Marienberg in Saxony, Joachimsthal in Bohemia and Markirch in Alsace.

PROUT, SAMUEL (1783-1852), English water-colour painter, was born at Plymouth on the 17th of September 1783. He spent whole summer days, in company with the ill-fated Haydon, in drawing the quiet cottages, rustic bridges and romantic water-mills of the beautiful valleys of Devon. He even made a journey through Cornwall to try his hand in furnishing sketches for Britton’s Beauties of England. On his removal in 1803 to London, which became his headquarters after 1812, a new scene of activity opened up before Prout. He now endeavoured to
correct and improve his style by the study of the works of the rising school of landscape. To gain a living he painted marine pieces for Palsor the printseller, received pupils, and published many drawing books for learners. He was likewise one of the first who turned to account in his profession the newly-invented art of lithography. It was not however until about 1818 that Prout discovered his proper sphere. Happening at that time to make his first visit to the Continent, and to study the quaint streets and market-places of continental cities, he suddenly found himself in a new and enchanting province of art. All his faculties, having found their congenial element, sprung into unwonted power and activity. His eye readily caught the picturesque features of the architecture, and his hand recorded them with unsurpassed felicity and fine selection of line. The composition of his drawings was excellently natural; their colour exhibited "the truest and happiest association in sun and shade"; the picturesque remnants of ancient architecture were rendered with the happiest breadth and largeness, with the heartfelt perception and enjoyment of their time-worn ruggedness; and the solemnity of great cathedrals was brought out with striking effect. At the time of his death, on the 10th of February 1852, there was scarcely a nook in France, Germany, Italy and the Netherlands where his quiet, benevolent, observant face had not been seen searching for antique gables and sculptured pieces of stone. In Venice especially there was hardly a pillar which his eye had not lovingly studied and his pencil had not dexterously copied.

See a memoir of Prout, by John Ruskin, in Art Journal for 1849, and the same author's Notes on the Fine Art Society's Loan Collection of Drawings by Samuel Prout and Horace Leys (1856). PROUT, WILLIAM (1785-1850), English chemist and physician, was born at Horton, Gloucestershire, on the 15th of January 1785, and died in London on the 9th of April 1850. His life was spent as a practising physician in London, but he also occupied himself with chemical research. He was an active worker in physiological chemistry, and carried out many analyses of the products of living organisms, among them being one of the gastric juice which, at the end of 1823, resulted in the notable discovery that the acid contents of the stomach contain hydrochloric acid which is separable by distillation. In 1815 he published anonymously in the Annals of Philosophy a paper "On the relation between the specific gravities of bodies in their gaseous state and the weights of their atoms," in which he calculated that the atomic weights of a number of the elements are multiples of that of hydrogen; and in a second paper published in the same periodical the following year he suggested that the \( \text{Hg}_n \text{O}_m \) of the ancients is realized in hydrogen, from which the other elements are formed by some process of condensation or grouping. This view, generally known as "Prout's hypothesis," at least had the merit of stimulating inquiry, and many of the most careful determinations of atomic weights undertaken since its promulgation have been provoked by the desire to test its validity.

PROVENÇAL LANGUAGE. The name Provençal is used to comprehend all the varieties of Romanic speech formerly spoken and written, and still generally used by country people in the south of France. The geographical limits of this infinitely varied idiom cannot be defined with precision, because it is conterminous on the north, south and east with idioms of the same family, with which almost at every point it blends by insensible gradations. Roughly speaking it may be said to be contained between the Atlantic on the west, the Pyrenees and Massif Central on the south, the Alps on the north by a line proceeding from the Gironde to the Alps, and passing through the departments of Gironde, Dordogne, Haute Vienne, Creuse, Allier, Loire, Rhône, Isère and Savoie. These limits are to some extent conventional. True, they are fixed in accordance with the mean of linguistic characters; but it is self-evident that according to the importance attached to one character or another they may be determined differently.

1. Different Names.—Though the name Provençal is generally adopted to designate the Romanic idiom of this region, it must not be supposed that this name has been imposed by general consensus, or that it rests upon any very firm historical basis. In the southern part of Gaul, Romanic developed itself, so to say, in the natural state of language. Contrary to what took place in other Romanic countries, no local variety here raised itself to the rank of the literary idiom par excellence. While in Italy the Florentine, in France the French dialect proper (that is to say, the dialect of the Íle de France), succeeded little by little in monopolizing literary use, to the exclusion of the other dialects, we do not find that either the Marseillais or the Toulousain idiom was ever spoken or written outside of Marseilles or Toulouse. In consequence of this circumstance, no name originally designating the language of a town or of a small district came to be employed to designate the language of the whole of southern France; and on the other hand the geographical names, whether Provençal, Provencal, or of the same idiom, were not to give one to the idiom.

In the middle ages the idiom was spoken of under various appellations: Romans or lenga romana was that most generally used. The name was employed by the authors of the Leys d'amors, a treatise on grammar, poetry and rhetoric, composed at Toulouse in the 14th century. But while it is capable of being applied and in fact, has been applied, to each of the Romanic languages individually, the term is too general to be retained in a particular case; though it was revived in the beginning of the 10th century by Raynouard, the author of the Lexique roman. Roman or langue romane is no longer in use among scholars to design the Romanic language of the south of France. In the 13th century a poet born in Catalonia, on the southern slope of the Pyrenees, Raimon Vidal of Besalú, introduced the name of Limousin language, probably on account of the great reputation of some Limousin troubadours; but he took care to define the expression, which he extended beyond its original meaning, by saying that in speaking of Limousin he must be understood to include Saintonge, Quercy, Auvergne, &c. (Rasos de trobar, ed. Stengel, p. 70). This expression found favour in Spain, and especially in Catalonia, where the little treatise of Raimon Vidal was extensively read. The most ancient lyric poetry of the Catalans (11th and 14th centuries), composed on the model of the poetry of the troubadours, was often styled in Spain poesia lemosina, and in the same country lengua lemosina, long designated at once the Provençal and the old literary Catalan.

The name Provençal as applied to language is hardly met with in the middle ages, except in the restricted sense of the language of Provence proper, i.e. of the region lying south of Dauphiné (the Dauphiné is a part of the south country of France, and in the 10th century, as well as later, it was included in the province of Dauphiné, which was governed by a count of the same name). But the term Limousin was recognized as a style of the language of the Auvergne, the south of the Rhône, the western side of the Pyrenees, the Vaucluse, and a part of the north of Spain, and was applied to the dialects of Spain, which, like those of France, were spoken by people of the same race, the same language, and of the same stock. But the name itself was derived from the home of the language, the town of Limoges (Limoges is a city in the province of Limousin, between the rivers Vienne and the Cher, and on the railway line between Paris and Bordeaux), which was regarded not only as the geographical centre of the region, but as the home of the language, and the name itself was applied to the style of the language of the town of Limoges, and the whole of the south of France, which was spoken there. But this was the language of Saintonge, Quercy, Auvergne, &c., and the name Limousin was applied to the language of the region, and not to the language of the town of Limoges.

1. The Provençal speech in the times in which it flourished was prized and held in great esteem all over the West, and among all the other idioms of that region was by far the foremost; so that every one who desired either to write or to write well, used it, for it was the idiom of the nation, the idiom of the nation, and the idiom of the nation, as it was called. (Prose, p. 12). This passage, in which the primacy of the Provençal tongue is manifestly exaggerated, is interesting as showing the name Provençal employed, though with little precision, in the sense in which we now apply it.
Another designation, which is supported by the great authority of Dante, is that of lingua d'oco (langue d’oc). In his treatise, *De vulgari eloquio* (bk. 1, chs. vii. and ix.), Dante divides the languages of Latin origin into three idioms, which he characterizes by the affirmative particles used in each, *oc, oll, si*; “nam alli *oc, alli oll, alli si*, affirmando loquuntur, ut puta Hispani, Franci, et Latini.” As is seen, he attributes the affirmation *oc* to the Spaniards, which is of course erroneous; but there is no doubt that to the Spaniards he joined more correctly the inhabitants of southern France, for in the *Vita nuova*, ch. xxv., and in the *Convivio*, I. x., he speaks of the lingua d’oco as having been long celebrated for its poets, which can apply only to the language of the troubadours. The name *langue d’oc* occurs also as early as the end of the 13th century, in public acts, but with a different sense, that of the province of Languedoc, as constituted after the union of the county of Toulouse to the French king’s dominion in 1218. In the legal acts of the period and in the 14th century paries *lingue occitane* or *pars de langue d’oc* designates the union of the five senechalships of Périgoux, Carcassonne, Beaufort, Toulouse and Rodez; that is to say, the province of Languedoc, such as it existed till 1700. Some scholars, following the example of Dante, still actually use the term *langue d’oc* in opposition to *langue d’ital*; but these names have the inconvenience that they take such a secondary fact as the form of the affirmative particle as an essential character. Moreover, it can hardly help to distinguish the other Romance languages, as *langue de si* would cause a confusion between Italian and Spanish. *Provençal*, without being entirely satisfactory, since in principle it applies solely to the language of Provence, is, notwithstanding, the least objectionable name that can be adopted. In addition to its being in some sense the characteristic of the use made of it by the Italians, who were the first after the Renaissance to study the works of the troubadours, it must not be forgotten that, just as the Roman *provincia*, in which the name originated, extended across the south of Gaul from the Alps to Toulouse and the Pyrenees, so still in the middle *provincias, provinciales*, were understood in a very wide sense to designate not only Provence strictly so called, i.e. the present departments of Alpes Maritimes, Basses Alpes, Var, Bouches du Rhône, but also a very considerable part of Languedoc and the adjacent countries. Thus in the 12th century the chronicler Albert of Aix-la-Chapelle (Albertus Aquensis) places the town of Puy (Haute Loire) in *Provincia*.  

2. General Characters of the Language in its Ancient State—The Provençal language, within the limits above indicated, cannot be said to have any general characteristics peculiarly peculiar to it. Such of its characteristics found in all the varieties of the language are met with also in neighbouring idioms; such as are not found elsewhere are not general characters, that is to say, are manifested only in certain varieties of Provençal. In reality “Provençal language” does not designate, speaking, a linguistic unity; it is merely a geographical expression.

**Tonic or Accented Vowels.**—*Latin a* is preserved in an open syllable a *mare, amat, amat, as well as in a closed syllable car, Carm, *car*.* This character is common also to the Romance of Spain and Italy; but it is one of the best distinguishing marks of the Valencian and of all varieties of Provençal. When an open syllable, does not pass beyond a line which would run approximately through Blaye, Couturs (Gironde), Ribera, Nontron (Dordogne), Bejaic (Haute Vienne), Boussac (Creuse), Montlauçon, Gannat (Allier), Montbrison (Loire). Starting eastward from Lyons or therabouts, there appears a notable linguistic fact which is observable in various proportions of the *Ain, Isère, and Savoie, and in Romanic Switzerland*. This is, that accenting in most cases, is accompanied by a light vowel sound, the *o* (e.g., *Aurora, aurora*), the *u* (e.g., *Burgo, burgos*), the *e* (e.g., *uré, uré*), the *i* (e.g., *qui, quí*). Generally, this fact is found regularly in French, the second which is regular in *Pr*. Pure *Pr* would have *-a* in both cases (e.g., *encher, debeter, destier, &c.); *Fr* would have *-er* (e.g., *encher, deblérer, destrier, &c.)*. But in Provençal (franco-provençal) to the varieties of Romanic in which we find this duality of treatment in Latin a, according as it was or was not preceded by a palatalized sound. Latin *ę* become close *e* (Ital *e chiuso; Fr. é* : há bér, ér e d r í t, ér e jen e m, S, é d e m, fe, plu m, pel. This character is not only common to Italian and Spanish, but also extends over the French domain inside the Rhône valley. It is observable in French only in such cases as those in which a syllable begins with a palatal sound (e.g., *Pr* mer) in which the character is traceable to the sound of open *I* (I. *a e r o p e * : péd e m, pe, lé v a t, lea, pé r o m, letré. In certain determinate cases, this *e*, from about the 13th century onwards, may diphthongize to *é* (*eg, eu, etc.*): *㓘, *pè d e m, *pa t le, *pè r a, *pa t le *). In Latin *ę* treated like *y* long when it precedes (with hiatus) another vowel: plu, pu, pu è, vi, a, li, la, li. Latin *a* is the only one and the same word (e.g., *alma, alma*). It is also observable in Old Spanish: *por* becomes *pa* (with accent *pa*). Latin *a* seems to have been preserved in the north of Spain and in the Romanic of Catalonia. This sound, which is styled by the Donat Provençal *o estrét* (close *o*), is usually symbolized in the early texts by *oa* and the later by *Tg* in *Tg* and Latin letters. Of course it is also regularly become open *o* (a urum, al, ala, d, ala, pures, tula). At present the pronunciation of Latin *a* does not extend much beyond the Provençal domain: it is, however, noticeable in certain dialects of the Languedoc (upper Rhône valley), and in Friulian, and it is to be supposed to have been once general over the whole of that zone. It is attested as late as the 16th century in the Vaucluse valleys of Piedmont, and there are also examples of it in the Italian dialects of the same region, where it regularly become open *o* (a urum, It. and Span, *or* fr. *or*, &c.)*. 

**Atomic Vowels.**—The atomic vowels (i.e. vowels of the unaccented syllables) which precede the accented syllable present very characteristic forms of diminution and increase. Thus we find the accented syllable, the post-tonic vowels. The *Pr* is one of the Romance idioms which, like the French, but unlike the Castilian and many dialects of Italy, admit of only one syllable after the accent. The *Pr* vowels are not, or are at least, fewer, than those of some exceptional cases real proparoxytones seem to have been preserved by accidental documents. In French only the vowel which can stand after the accented syllable is "e feminine," otherwise called "e libre" (*trè, *trè, *trè, &c.*). In Italian, however, the vowels *u* and *o* have survived in that position, but *i* and *a* also occur. In French the first of the two post-tonic vowels of a Latin proparoxytone always disappears; in *Pr* it tends to be preserved, followed by one of the consonants *n, t, i* (*let, *let, *let, &c.*), or *v, f, c* (*fet, *fet, *fet, &c.*). There are a few exceptions in monosyllables, from which it appears that the copist, not the author, is responsible for them. Again, names of places ending in *-icion, -icion*, as *Conichen, De-Attaichanicus, Dominichanis, &c.*, now *Colorques, De-assargues, Domessargues*, in *Pr* Garci, appear in the 12th and 13th centuries as *Colonesques, Dasoneuges, Domensanegues*. Moreover *Pr* presents in certain words coming from Latin proparoxytones the trace of forms which (like Italian) admitted two atomic vowels after the accented syllable; thus we have *purge, purge* (*purge*, *purge*), *Fabre, fa, Faber, fabra*, and *pura, pura, pura, pura, pura, pura* is also the character of the *pronominal",* *pronoun, *pronoun"* (in the old sense). 

**Consonants.**—The boundary usually recognized between *Pr* and French is founded upon linguistic characters furnished by the Provençal language in the main features furnished by the consonants. *Pr* is characterized by the greater number of consonants furnished by the consonants, the line of demarcation would have to be drawn farther south, because the consonantal system which is regarded as proper to French really extends in its main features throughout the whole of the Pr. As with the vowels, only a few of the salient facts can here be indicated. *C initial, or second consonant of a group, after a (c *balium, mercatium*), preserves its Latin sound; as in *cina, ceina*. In the *north of the Rhône valley* it takes the sound of *t* (*Fr* ch *chin*), as in Old French, and this sound is still pretty well preserved, although there is here and there a tendency to the present sound of *ch* in *Fr* (*c *heng*). *The place-names Caisel, Chasatel, Chisol*, in *Dordogne, Haute Vienne, Corrèze, Puy de Dôme*, *Cantal, Haute Loire*, the north of *Lozère*, *Andeché, of*
Drome, of Isère, and of Hautes Alpes, and Castel, Castanet, Canel, farther to the south. Analogously, g, initial, or second consonant of a group, followed by a, becomes j (i.e. di - = O. Fr. and Eng. j in jam) in the same zone; Gărlica is Jarjiga, Jarjiga in Dordogne, Corne on the Loire, &c. In all these words the d is retained, the a is softened to a very m. Between two vowels t becomes d; edat, emperadour, natala, amant a etem, imperatorem, natalla, amata. This was also the case in O. Fr. until about the 10th or 11th century (hornedour, horned). In the 13th and 14th centuries, in the northern zone this d, representing a Latin t, fell away as early as in French. In 11th century text from the environs of Valence we read murcaor, correa (muratoare, corrogàta, Fr. corée (F. Meyer, Recueil d'anciens textes, Provençal section, No. 40). In the south-in - is sometimes given between two words every where until about the middle of the 12th century, when it became s (as in Fr. and Eng. sero); cruad, azaor, asor, seer (crudelam, adorare, audire, videre). In the 14th and 15th centuries in the north-western part of the domain, t and ma became amable, amabel (Latin amabilis), t becomes a. Is there in the 11th century, shows in this respect great hesitation: e.g. d preserved in chaden, credet, tradat, veder (c adentem, c rededit, t radat, videre); d fallen away in creessen, fueessen, vouessen, voues, seu (seu, vestu, sed casd, vestum; dationem, vidutum, p. ple. de videre, dier). One of the most general facts in Fr. is the habit of rejecting Latin final t, of which examples to any number are presented by the verbs. In the Provençal those with a final t or the cases rendered by t in Latin, retained, aimer, aiment, aiment, were, in every written form is able to become r (lingual, not uvular); aimer, viren (au duire, videntem). In Béarn and Gascony d remained, as in the northern zone Latin d, instead of changing into r, s, disappeared as in Béarn, though in Gascony some third case, dropping (of course) into the addition (Latin s) is indicative of the 11th century. This is shown in Fr. in d'ers, d'etern, d'etc., which remains, aimer, aiment, aiment, and still remains (in writing at least) when, in Latin, it follows a consonant, aiment, fall, fail, s, etc. (a ma t, facit, fact, vital, vitivit); but in the Provençal in this position, t remains, even in d'etern. Yet in the northern zone we find the t retained in the 3rd per. of verbs, ait, amit (Lat. a, amat, un t). H. has gone completely (or at least only appears through orthographic tradition, and of a different kindness, (her) (homen) &c., nom., in words of Latin origin, which is the case in Old Fr. in some texts in Teutonic words (anta, ardii, arsuce, ertm, Fr. honte, hardi, hareng, haubert, heiss, bo), in a-capselânum, vicum, bonum, &c. These are the most important characteristics of the consonants in relation to the extent of space over which they prevail. Others, which are not so numerous, though of a more interesting kindness on account of their strangeness. It will suffice to mention a few which belong to the district bounded on the west and south by the Atlantic, the Basque provinces and the Pyrenees, and which have probably influence on their consonants in the other districts as far as the Gironda. (This includes Béarn, Bigorre and Gascony.) Here the sound t no longer exists, being replaced generally by b; between two vowels, in Gascony, by b with the addition of a nasal, it becomes a guttural "mb", as in mbis, a-bis, abis, abim, abis, etc. The sound t lost after the same position in both Fr. and Provençal. It is evident that this was a sound very curious for the speakers of the neighboring language. This sound t being lost in Fr. to the north and south, and in this word "tis", it has not even been noted in the Pyrenees, for example, in the name Castanet, Castanet, Co. The vocabulary is a purely Latin word, and is not Provençal. It is evident that this sound t was lost in Fr. to the north and south, and also in a very limited number of cases, but was never lost in the Provençal. The Provençal has been adopted as the basis of the modern Fr. In the south-in - after the 11th century the sound t is not noticeable, but in the north, and in the Pyrenees it remains, as in d'ern. In the Pyrenees, the sound t is not noticeable.
The 12th and 13th centuries we find in the subj., case pl., and especially in this predicative use, pagai, certifiable, acossölithak, representing pagati, certificati, adconsiliati.

A similar peculiarity is noticeable also in masculine substantives, but the subj. may be limited to the forms daci, aaci [Lat. a viciell] (see A. Thomas, in Romania, xxxiv. 353).

It is in the verbs that the individuality of the different Romance idioms manifests itself most distinctly. At a very early date the extended and diminished forms of participles and adjectives, which are the basis of the verb in the Romance languages, began to develop from the verbal roots, respectively; as in the whole Romance domain, the conjugation in -ar is the most numerous. The table of verbs, which forms part of the Pr. grammar called the Donatis Procesalis (13th century), contains 473 verbs in -ar, 101 in -er and -ir, 115 in -ir. In the -er conjugation we remark one verb from another conjugation: far (cf. Ital. fare) from facere. The conjugations in -er and -re encroach each upon the territory of the other. The three Lat. verbs cadere, capere, sapere have become -er verbs (case, eber, eber) as in Pr. chere, cener (reco(e)voir), savoir; and several other verbs wager between the two: creder, creer, and creere (creder, creer) and crevere (quaere, crevere). This fluctuation is most frequent in the case of verbs which belong to different conjugations in Latin, as in the -ar: plasere and paisere, taser and tare (ardere, placere, taceere). Next to the -ar conjugation, that in -ir is the only one which has preserved most formative power. As in the other Romance languages, there are a number of special forms, and it has particularly been the case with French, that in -ir, a number of verbs which etymologically ought to have belonged to the conjugations in -er and -re: empir (im-piere), fausier (gauedere), coërir (consuer), creber (berber), fugier (fugere), sueter (sequer-sequere) also seger.

Except in the -ar conjugation, the ending of the infinitive does not determine in a regular manner the mode of forming the different tenses. The present participles are almost always identical with those in -an (ob. sing.) for the first conj., those in -en for the others. In this the Pr. distinguishes itself very clearly from the French, in which all participles have the ending -ere. There is always a participle forming a verbal adjective which is not met with in any other Romance language, except Rumanian, where, moreover, it is employed in a different sense: this is a form in -dor, - dor, which supposes a Latin type -torius, -tor, and expresses a form of a future participle, active for the intransitive verbs, passive for the transitive: endendedor, -dor, "that is to happen"; fasededor, -dor, "that is to be done"; punidor, -dor, "to be punished".

In conjugation provencal, the so-called "Romanic" mark is placed before the first vowel of the Lat. preterit in -aro, of which traces are found only in texts written in the neighbourhood of the French-speaking region, and in Béarn. In return, a preterit which seems to have been formed by lengthening of the Lat. name of the verb and become the type of the tense almost everywhere in the -ar conjugation, and in many verbs in -er and -re: amei, amet, amet, ame-m, ame-a, ame-r. In French there is a form like this, or at least very similar, only in a small number of verbs, none of which belong to the first conjugation, and in these only in the 3rd pers. sing. and pl. (perdii, perdierent; entendit, entendirent, &c.). It is well known that reduplicated preterits had greatly multiplied in vulgar Latin: there have been recovered such forms as persidere, postidere, ostenidere, pendiderunt, adstendere, incendiderat, &c. (see Schuchardt, Vokalismus des Vulgarlateins, i. 35, iii. 10; cf. Romania, ii. 477). But, in order to explain the peculiar manner of forming the Latin present perfect, we must not in -i dor- ed, but in -éd. In the western region the 3rd pers. sing. is generally in -ec, probably by analogy with preterites like bec, crec, sec, sec, formed after the Latin type in -ui. Another modification is the formation of which Ohle, from texts of a very remote period, is the preservation of a preterite in -aro or -era, derived from the Latin pluperfect, amara or amera, "I loved." The former, which is rare, comes directly from Lat. and is a reduplicated form, and in -i. This preterite is used with the sense of a simple past, not of a pluperfect, and consequently is an exact doublet of the ordinary preterite, which explains how it was at length eliminated almost entirely in south France; whereas of which became 

3. Modern Provençal.—In consequence of political circumstances the Provençal ceased to be used for administrative as well as literary purposes about the 15th century, in some places a little sooner, in others later (notably in Béarn, where it continued to be written as the language of ordinary use till the 17th, and even in some places till the 18th century). The poems in local dialect composed and printed in the 16th century, and on to our own day, have no link with the literature of the preceding period. Reduced to the condition of a patois, or popular dialect, simply, the idiom experienced somewhat rapid modifications. Any one who should compare the poems of Goudelin of Toulouse (1570-1640) with those of a Toulousain troubadour of the 13th century would be astonished at the changes which the language has undergone. Yet this impression would probably be exaggerated. In order to make a rigorously accurate comparison of the language at the two epochs, it would have to be written in the two cases with the same orthographic system, which it is not. The first writers of Provençal, about the 10th and 11th century, applied to the language the Latin orthography, preserving to each letter, as far as possible, the value given to it in the contemporary pronunciation of Latin. To express certain sounds which did not exist in Latin, or which were not clearly pronounced, there was introduced a metaphorically light, and without regular system, various conventional symbolizations such as lh and nh to symbolize the sound of l and n monosyllables. From this method of proceeding there resulted an orthographic system somewhat wanting in fixity, but which from its instability lent itself fairly well to the variations which the pronunciation underwent in time and locality. But, the tradition having been interrupted about the 13th century, those who afterwards by way of pastime attempted composition in the patois formed, each for himself apart, an orthography of which many elements were borrowed from French usage. It is evident that differences already considerable must be exaggerated by the use of two very distinct orthographical systems. Nevertheless, even if we get quit of the illusion which makes us at first sight suppose differences of sound where there are merely different ways of spelling the same sound, we may find that between the 14th and 16th centuries the language underwent everywhere, Béarn excepted, great modifications both in vocabulary and grammar. The Provençal literature having gradually died out during the 14th century, the vocabulary lost rapidly the greater part of the terms expressing general ideas or abstract conceptions. To supply the place of these, the authors who have written in the patois of the south during the last few centuries have been obliged to borrow from French, modifying at the same time their form, a multitude of vocabularies which naturally have remained for the most part unintelligible to people who know only the patois. In this case the adoption of foreign words was excusable; but it did not stop here. Little by little, as primary instruction (now compulsory) was diffused, and introduced, first in the towns and afterwards in the villages, certain knowledge of French, words purely French, have been introduced into use, in place of the corresponding dialect words. Thus, one hears constantly in Provençal po-ró, moy, ñó, forms adapted from French, instead of paire, mair, fraie, caça (catxa = Fr. cachar) instead of escouaré, &c.

In the phonology, the modifications are of the natural order, and so have nothing revolutionary. The language has developed locally tendencies which certainly already existed during the flourishing period of the language, before the 10th century. Of the vowels, a tonic is generally preserved; as in an ornamental syllable becomes ò (open) in part of the departments of Aveyron, Lot, Dordogne, Corrèze, Cantal and south of Haute Loire; go (grr) became ò (open) after a long vowel. After the short vowels we find in Gothic the sound a which had reduced itself in ordinary use already in the 14th century—but in many places there no longer remains any distinction between the singular and
PROVENÇAL LITERATURE

945

by Professor E. Levy in his Provençalisch Supplement-Wörterbuch (5 vols., Leipzig, 1892-1910, stops actually at letter P). The numerous special vocabularies appended by editors to texts published by them cannot be neglected. These yield a considerable number of words, and the vocabulary is limited only by the materials of which the language is formed. For a history of the language, see H. de Boly's Geschichte der Provençalischen Sprache (Vienna, 1873-1876); E. Coulin, Grammaire littéraire du provençal (Montélimar, 1874); M. de Montferrat, Dictionnaire du provençal (Nice, 1878); see also his "Phonétique monaissaise," in Romanica, xii, 354; Cantagrel, "Notes sur l'orthographe et la prononciation provençale," prefixed to La Consonne de la Languedoc, by A. M. Grandgent (Paris, 1896, 1899), also to Grammaire provençale de la région françaises (Paris, 1879); Monti, Grammaire provençal, dauphinoise, dialecte de la vallée de la Drome (Montélimar, 1882); Ruben, "Étude sur le patois du Haut Limousin," prefixed to Poems by J. Foucaud, in the Limousin poâtois (Limoges, 1866). For a complete history of the language of North Provence: Provençale historique du patois de Vinsesles (Paris, 1867,ATURED, for history of the Provencal in all its varieties there are many more materials than for any other Romanic language, not excepting even Italian or French. The literary texts go back to the 18th century. The MSS. of the MSS. are usually below the 14th century; these texts are of secondary value, because the MSS. in which they have reached us, and several of which, especially for the poetry of the troubadours, are of Italian origin, have altered the original forms to make them better adapted to the literary style of the time. There are also a number of manuscripts containing fewer number of charters, coutumes, regulations, accounts, registers of taxation, which are worthy of absolute confidence, because these documents are in most cases original, and, secondly, because many of the MSS. are found in the same MSS., which present the language in a somewhat artificial state—the written rather than the spoken language.

BIBLIOGRAPHY: 1. Ancient Condition.—There does not exist any literary work on the provençal language which, to the author's precise idea of the history of the language at its different epochs. Diez's Grammatik der romanischen Sprachen is still the groundwork. It gives, especially in the 3rd ed. (1866-1872), the last revised by the author, which is the results of extensive researches. In 1864, a dictionary of the language, by the author's son, Raynaud, was published. Its usefulness was much limited by the fact that what was wanted was not a supplement but a general recast. Meyer-Lübke's Grammatik der romanischen Sprachen (Leipzig, 1869), which, with its 7th ed. (1910), represents a more advanced state of Romanic philology, and is the best in the number of inaccuracies, and is of little use for the study of Provençal. The "Recherches philologiques sur la langue romane," by Jeanne Roze, in the Revue de l'ancien Provençal, (1853), is entirely out of date. The "Tableau sommaire des flexions provençales," published by K. Bartsch, in the Christologiae provençalis, (1854) is, incompletely and often erroneous. Better is the introduce vocabulaire de l'ancien provençal, by V. Guyon, Manuscript of the language of particular texts prefixed to editions of these. As to dictionaries, the Lexique provençal, ou dictionnaire de la langue des troubadoures, by Raynaud (6 vols., Paris, 1836-1841), can always be used with advantage. It has been largely supplemented

2. Modern Form.—The most useful grammatical works (all done with insufficient knowledge of phonology, and under the preconceived idea that there exist dialects with definite circumscription) are: Grandgent, Grammaire littéraire du provençal (Paris, 1874); Vanilo, Grammaire provençale (Nice, 1878); R. Coulin, Grammaire littéraire du provençal (Montélimar, 1874); A. M. Grandgent, Grammaire provençale (Paris, 1896).

In the course of the 13th century the art of composing in the vulgar tongue did not exist, or was only beginning to exist, to the south of the Alps and the Pyrenees. In the north, in the country of French speech, vernacular poetry was in full bloom; but between the districts in which it had developed—Champagne, Ile de France, Picardy and Normandy—and the region in which Provençal literature had sprung up, there seems to have been an intermediate zone formed by Burgundy, Bourbons, Berry, Touraine and Anjou, which, far on in the middle ages, appears to have remained almost barren of vernacular literature. In its rise Provençal literature stands completely by itself, and in its development it long continued to be absolutely original. It presents at several points genuine analogues with the sister-literature of the north of France; the latter are undeniably intermediate in type to those of the south, and are common to both and only in a slight degree to mutual reaction.

It must be inquired, however, what amount of originality could belong to any, even the most original, Romanic literature in the middle ages. In all Romanic countries compositions in the vernacular began to appear while the custom of writing in Latin was still preserved by uninterrupted tradition. Even during the most barbarous periods, when intellectual life was at its lowest, it was in Latin that sermons, lives of saints more or less apocryphal, accounts of miracles designed to attract pilgrims to certain shrines, monastic annals, legal documents, and contracts of all kinds were composed. When learning began to revive, as was the case in northern and central France under the influence of Charlemagne and later in the 11th century, it was Latin literature which naturally received increased attention, and the Latin language was more then ever employed
in writing. Slowly and gradually the Romancic languages, especially those of France, came to occupy part of the ground formerly occupied by Latin, but even after the middle ages had passed away the parent tongue retained no small portions of its original empire. Consequently Romancic literatures in general (and this is especially true of Provençal, as it does not extend beyond the medieval period) afford only an incomplete representation of the intellectual development of each country. Those literatures even which are most truly national, as having been subjected to no external influence, are only to a limited extent capable of teaching us what the nation was. They were, in short, created in the interests of the illiterate part of the people, and to a considerable degree by men themselves almost devoid of literary learning. But that does not make them less interesting.

Origin.—It was in the 11th century, and at several places in the extensive territory whose limits have been described in the foregoing account of the Provençal language, that Provençal literature first made its appearance. It was written in a poetic form; and its oldest monuments show a relative perfection and a variety from which it may be concluded that poetry had already received a considerable development. The oldest poetic text, of which the date and origin are not surely determined, is said to be a Provençal burden (Fr. refrain) attached to a Latin poem which has been published (Zeitschrift für deutsche Philologie, 1881, p. 335) from a Vatican MS., written, it is asserted, in the 10th century. But it is useless to linger over these few words, the text of which seems corrupt, or at least has not yet been satisfactorily interpreted. The honour of being the oldest literary monument of the Provençal language must be assigned to a fragment of two hundred and fifty-seven decasyllabic verses preserved in an Orleans MS. and frequently edited and annotated since it was first printed by Raynouard in 1857 in his Choix des poésies originales des troubadours. The writing of the MS. is of the first half of the 11th century. The peculiarities of the old language point to the north of the Provençal region, probably Limousin or Marche. It is the beginning of a poem in which the unknown author, taking Boethius's treatise De consolatione philosophiae as the groundwork of his composition, adopts and develops its ideas and gives them a Christian colouring of which there is no trace in the original. Thus from some verses in which Boethius contrasts his happy youth with his afflicted old age he draws a lengthy homily on the necessity of laying up from early years a treasure of good works. The poem is consequently a didactic piece composed by a "clerk" knowing Latin. He doubtless preferred the poetic form to prose because his illiterate contemporaries were accustomed to poetry in the vulgar tongue, and because this form was better adapted to recitation; and thus his work, while a product of erudition as far as it was an adaptation of a Latin treatise, shows that at the time when it was composed a vernacular poetry was in existence. A little later, at the close of the same century, we have the poems of William IX., count of Poitiers, du 32 of Guienne. They consist of eleven stanzas, each of fifteen lines, and were consequently meant to be sung. Several are love songs; one relates a bonne fortune in very good terms; and the most important of all—the only one which can be approximately dated, being composed at the time when William was setting out for Spain to fight the Saracens (about 1119)—expresses in touching and often noble words the writer's regret for the frivolity of his past life and the apprehensions which oppressed him as he bade farewell, perhaps for ever, to his country and his young son. We also know from Ordericus Vitalis that William IX. had composed various poems on the incidents of his ill-fated expedition to the Holy Land in 1101. And it must further be mentioned that in one of his pieces (Bent vei que sapcion li plusor) he makes a very clear allusion to a kind of poetry which we know only by the specimens of later date, the partsin, or, as it is called in France, the jau parti. William IX., born in 1071 and died in 1127. There is no doubt that the most prolific period of his literary activity was his youth. On the other hand there is no reason to believe that he created the type of poetry of which he is to us the oldest representative. It is easy to understand how his high social rank saved some of his productions from oblivion whilst the poems of his predecessors and contemporaries disappeared with the generations who heard and sang them; and in the contrast in form and subject between the Boethius poem and the stanzas of William IX. we find evidence that by the 11th century Provençal poetry was being rapidly developed in various directions. Whence came this poetry? How and by whose work was it formed? That it has no connexion whatever with Latin poetry is generally admitted. There is absolutely nothing in common either in form or ideas between the last productions of classical Latinity, as they appear in Sidonius Apollinaris and Fortunatus, and the first poetic compositions in Romancic. The view which seems to meet with general acceptance, though it has not been distinctly formulated by any one, is that Romanic poetry sprang out of a popular poetry quietly holding its place from the Roman times, no specimen of which has survived—just as the Romanic languages are only continuations with local modifications of vulgar Latin. There are both truth and error in this opinion. The question is really a very complex one. First as to the form Romanic versification, as it appears in the Boethius poem and the verses of William IX., and a little farther north in the poem of the Passion and the Life of St Leger (10th or 11th century), has with all its variety some general and permanent characteristics; it is rhymed, and it is composed of a definite number of syllables certain of which have the syllabic accent. This form has evident affinity with the rhythmical Latin versification, of which specimens exist from the close of the Roman Empire in ecclesiastical poetry. The exact type of Romanic verse is not found, however, in this ecclesiastical Latin poetry; the latter was not popular. However, it may be assumed that there was a popular variety of rhythmical poetry from which Romanic verse is derived.

Again, as regards the substance, the poetic material, we find nothing in the earliest Provençal which is strictly popular. The extremely personal compositions of William IX. have nothing in common with folk-lore. They are subjective poetry addressed to a very limited and probably rather aristocratic audience. The same may be said of the Boethius poem, though it belongs to the quite different species of edifying literature; at any rate it is not popular poetry. Vernacular compositions seem to have been at first produced for the amusement, or in the case of religious poetry, for the edification, of that part of lay society which had leisure and lands, and reckoned intellectual pastime among the good things of life. Gradually this class, intelligent, but with no Latin education, enlarged the circle of its ideas. In the 12th century, and still more in the 13th, historical works and popular treatises on contemporary science were composed for its use in the only language it understood; and vernacular literature continued gradually to develop partly on original lines and partly by borrowing from the literature of the classical, of which the 11th century vernacular poetry had still rather limited forms. There has been rather more object than the amusement or the edification of the other classes. An aristocratic poetry, such as it appears in the oldest Provençal compositions, cannot be the production of shepherds and husbandmen; and there is no probability that it was invented or even very notably improved by William IX.

From what class of persons then did it proceed? Latin chroniclers of the middle ages mention as joculaires, jocularitores, men of a class not very highly esteemed whose profession consisted in amusing their audience either by what we still call jugglers' tricks, by exhibiting performing animals, or by recitation and song. They are called joklers in Provençal, jouglers or jousleurs in French. A certain Barnaldus, styled jocularius, appears as witness in 1058 to a charter of the chapterly of St Victor at Marseilles. In 1106 the act of foundation of a saula terra in Bourguie specifies that neither knight nor men-at-arms nor joculator is to reside in the village about to be created. These individuals—successors of the mimi and the thymelici of antiquity, who were professional amuses of the public—were
the first authors of poetry in the vernacular both in the south and in the north of France. To the upper classes who welcomed them to their castles they supplied that sort of entertainment now sought at the theatre or in books of light literature. There were certain of them who, leaving buffooney to the ruder and less intelligent members of the profession, devoted themselves to the composition of pieces intended for singing, and consequently in verse. In the north, where manners were not so refined and where the taste for warlike adventure prevailed, the jongleurs produced *chansons de geste* full of tales of battle and combat. In the courts of the southern nobles, where wealth was more abundant and a life of ease and pleasure was consequently indulged in, they produced love songs. There is probably a large amount of truth in the remark made by Dante in ch. xxx. of his *Vita nuova*, that the first to compose in the vulgar tongue did so because he wished to be understood by a lady who would have found it difficult to follow Latin verses. And in fact there are love songs among the pieces by William of Poitiers; and the same type preponderates among the compositions of the troubadours who came immediately after him. But it is worthy of note that in all this vast body of love poetry there is no epithalamium nor any address to a marriageable lady. The social conditions of the south of France in the feudal period explain in great measure the powerful development of this kind of poetry, and also its peculiar characteristics—the profound respect, the extreme deference of the poet towards the lady whom he addresses. Rich heiresses were married young, often when hardly out of their girlhood, and most frequently without their fancy being consulted. But they seem after marriage to have enjoyed great liberty. Eager for pleasure and greedy of praise, the fair ladies of the castle became the natural patronesses of the *menie* or household of men-at-arms and jongleurs whom their husbands maintained in their castles. Songs of love addressed to them soon became an accepted and almost conventional form of literature; and, as in social position the authors were generally far below those to whom they directed their amorous plaints, this kind of poetry was always distinguished by great reserve and an essentially respectful style. From the beginning the sentiments, real or assumed, of the poets are expressed in such a refined and guarded style that some historians, over-estimating the virtue of the ladies of that time, have been misled to the belief that the love of the troubadour for the mistress of his thoughts was generally platonic and conventional.

The conditions under which Romanic poetry arose in the south of France being thus determined as accurately as the scarcity of documents allows, we now proceed to give a survey of the various forms of Provençal literature, chronological order being observed in each division. By this arrangement the wealth of each form will be better displayed; and, as it is rare in the south of France for the same person to distinguish himself in more than one of them, there will be generally no occasion to introduce the same author in different sections.

**Poetry of the Troubadours.**—Though he was certainly not the creator of the lyrical poetry of southern France, William, count of Poitiers, by personally cultivating it gave it a position of honour, and indirectly contributed in a very powerful degree to ensure its development and preservation. Shortly after him centres of poetic activity make their appearance in various places—first in Limousin and Gascony. In the former province lived a viscount of Ventadour, Edele, who during the second part of William of Poitiers’s life seems to have been brought into relation with him, and according to a contemporary historian, Geoffroy, son of Vigeois, *erat valde gratiosus incontinit.* We possess none of his compositions; but under his influence Bernart of Ventadour was trained to poetry, who, though only the son of one of the serving-men of the castle, managed to gain the love of the lady of Ventadour, and when on the discovery of their amour he had to depart elsewhere, received a gracious welcome from Eleanor of Guinée, consort (from 1152) of Henry II. of England. Of Bernart’s compositions we possess about fifty songs of elegant simplicity, some of which may be taken as the most perfect specimens of love poetry Provençal literature has ever produced. Bernart must therefore have been in repute before the middle of the 12th century; and his poetic career extended well on towards its close. At the same period, or probably a little earlier, flourished Cercamon, a poet certainly inferior to Bernart, to judge by the few pieces he has left us, but nevertheless of genuine importance among the troubadours both because of his early date and because definite information regarding him has been preserved. He was a Gascon, and composed, says his old biographer, “pastorals” according to the ancient custom (*pastoralas a la uanus antica*). This is the record of the appearance in the south of France of a poetic form which ultimately acquired large development. The period at which Cercamon lived is determined by a piece where he alludes very clearly to the approaching marriage of the king of France, Louis VII, with Eleanor of Guinée (1137). Among the earliest troubadours may also be reckoned Marcabrun, a pupil of Cercamon’s, from whom we have about forty pieces, those which can be accurately dated ranging from 1135 to 1148 or thereabout. This poet has great originality of thought and style. His songs, several of which are historical, are free from the commonplaces of their class, and contain curious strictures on the corruptions of the time.

We cannot here do more than enumerate the leading troubadours and briefly indicate in what conditions their poetry was developed and through what circumstances it fell into decay and finally disappeared: Peter of Avrernge (Peire d’Alverna), who in certain respects must be classed with Marcabrun; Arnaut Daniel, remarkable for his complicated versification, the inventor of the *sestina*, a poetic form for which Dante and Petrarch express an admiration difficult for us to understand; Arnaut of Mareuil, who, while less famous than Arnaut Daniel, certainly surpasses him in elegant simplicity of form and delicacy of sentiment; Bertran de Born, now the most generally known of all the troubadours on account of the part he is said to have played both by his sword and his *sirenetes* in the struggle between Henry II. of England and his rebel sons, though the importance of his part in the events of the time seems to have been greatly exaggerated; Peire Vidal of Toulouse, a poet of varied inspiration who grew rich with gifts bestowed on him by the greatest nobles of his time; Guiraut de Bornell, *lo maestre dels trobadors*, and at any rate master in the art of the so-called “close” style (*trobar clus*), though he has also left us some songs of charming simplicity; Gaucelm Faidit, from whom we have a touching lament (*planh*) on the death of Richard Cœur de Lion; Folquet of Marseilles, the most powerful thinker among the poets of the south, who from being a troubadour became first a monk, then an abbot, and finally bishop of Toulouse (d. 1231).

It is not without interest to discover from what class society the troubadours came. Many of them, there is no doubt, had a humble origin. Bernart of Ventadour’s father was a servant, Peire Vidal’s a maker of furred garments, Perdigan’s a fisher. Others belonged to the bourgeoisie: Peire d’Alverna, for example, Peire Raimon of Toulouse, Elias Fonsalada. More rarely we see traders’ sons becoming troubadours; this was the case with Folquet of Marseilles and Almeric de Peguian. A great many were clerics, or at least studied for the Church, for instance, Arnaut of Mareuil, Hugh of Saint Circq (Uc de Saint Circ), Almeric de Bélenoi, Hugh Brunet, Peire Cardinal; some had even taken orders: the monk of Montaumond, the author of the *Eulogy of the Fool*. Ecclesiastical authority did not always tolerate this breach of discipline. Gui d’Ussel’s canon and troubadour, was obliged by the injunction of the pontifical legate to give up his song-making. One point is particularly striking, the number of nobles (usually poor knights whose incomes were insufficient to support their rank) who became troubadours, or even, by an inferior descent, jongleurs: Raimon de Miraval, Pons de Capdouil, Guillem Azemar, Cadenet, Peirol, Raimbaut de Vaqueiras, and many more.
There is no doubt they betook themselves to poetry not merely for their own pleasure, but for the sake of the gifts to be obtained from the nobles whose courts they frequented. A very different position was occupied by such important persons as William of Poitiers, Raimbaut of Orange, the viscount of Saint Antonin, William of Berga and Blacatz, who made poetry for their own amusement, but contributed not a little, by thus becoming troubadours, to raise the profession.

The profession itself was entirely dependent on the existence and prosperity of the feudal courts. The troubadours could hardly expect to obtain a livelihood from any other quarter than the generosity of the great. It will consequently be well to mention the more important at least of those princes who are known to have been patrons and some of them practisers of the poetic art. They are arranged approximately in geographical order, and after each are inserted the names of those troubadours with whom they were connected.

France.—ELEONOR OF GUENNE, Bernart de Ventadour (Vendadorn); HENRY CURTMASTE, son of Henry II. of England, Bernard de Bore (†); RICHARD COEUR DE LION, Arnaut Daniel, Peire Vidal, Folquet of Marseilles, Gaucelm Faidit; ERMENEGILD OF NARBONNE (1145-1192), Bernart de Ventadour, Peire Rogier, Peire d’Alverna; RAISON V., count of Toulouse (1145-1194), Bernart de Ventadour, Peire Rogier, Peire Raingau, Folquet, Feraud; RAISON VI., count of Toulouse (1194-1222), Raïmon de Miraval, Aimeric of Peguian, Aimeric of Beleni, Ademar no Negre; ALPHONSE II., count of Provence (1193-1209), HÉRIBERT IV., count of Carcassonne (1200-1219), Sordel, BARRAL, viscount of Marseilles (d. c. 1192), Peire Vidal, Folquet de Marseilles; WILLIAM VIII., lord of Montpellier (1172-1204), Peire Raingau, Arnaut de Mareuil, Folquet de Marseilles, Guerigaut de Cavarde; CALENDON, Aimeric de Sarlat; ROBERT, d’Henri II., count of Rodez (1274-1302), Guerigaut Riquer, Folquet de Lunel, Servier de Girone, Bertran Carbonel; NUNO SANCHEZ, count of Roussillon (d. 1241), Aimeric de Beleni; BERNARD IV., count of Astarac (1249-1261), Guerigaut Riquer, Arnaut Carbonel.

Spain.—ALPHONSE II., king of Aragon (1162-1196), Peire Rogier, Peire Raingau, Peire Vidal, Cadenet, Guerigaut de Cabreré, Elias de Barjols, the monk of Montaudon, Hugh Brunet; PETER II., king of Aragon (1196-1213), Peire Rogier, Peire Raingau, Elias de Barjols, Ademar de Barberie, Alphonso de Montaudon, Hugh Brunet, Perigord, Ademar le Negre, Hugh of Saint Ciri, perhaps Hugh IV., count of Rodez (1222-1247) and BERNARD II., count of Rodez (1274-1302), Guerigaut Riquer, Folquet de Lunel, Servier de Girone, Bertran Carbonel; NUNO SANCHEZ, count of Roussillon (d. 1241), Aimeric de Beleni; BERNARD IV., count of Astarac (1249-1261), Guerigaut Riquer, Arnaut Carbonel.

Italy.—BONIFACE II., marquis of Monterrat (1192-1207), Peire Vidal, Raïmon de Vaqueiras, Elias Cairel, Gaucelm Faidit (?); FERDINAND II., emperor (1215-1250), Elias de Barjols, Raïmon de Peguian, Guerigaut Figueria; AZZO VI., marquis of Este (1166-1212), Aimeric de Peguian, Rambertin de Buvallet; AZZO VIII., marquis of Este (1215-1264), Aimeric of Peguian.

The first thing that strikes one in this list is, that while the troubadours find protectors in Spain and Italy, they do not seem to have been welcomed in French-speaking countries. This, however, must not be taken too absolutely. Provengal poetry was appreciated in the north of France. There is reason to believe that when Constance, daughter of one of the counts of Arles, was married in 998 to Robert, king of France, she brought along with her Provengal jongleurs. Poems by troubadours are quoted in the French romances of the beginning of the 13th century; some of them are transcribed in the old collections of French songs, and the preacher Robert de Sorbon informs us in a curious passage that one day a jongleur sang a poem inspired by the Viscount of Marseilles at the court of the king of France. But in any case it is easy to understand that, the countries of the langue d’oï are having a full developed literature of their own suited to the taste of the people, the troubadours generally preferred to go to regions where they had less to fear in the way of competition.

The decline and fall of troubadour poetry was mainly due to political causes. When about the beginning of the 13th century the Albigensian War had ruined a large number of the nobles and reduced to lasting poverty a part of the south of France, the profession of troubadour ceased to be lucrative. It was then that many of those poets went to spend their last days in the north of Spain and Italy, where Provengal poetry had for more than one generation been highly esteemed. Following their example, other poets who were not natives of the south of France began to compose in Provengal, and this fashion continued till, about the middle of the 13th century, they gradually abandoned the foreign tongue in northern Italy, and somewhat later in Catalonia, and took to singing the same airs in the local dialects. About the same time in the Provencal region the flame of poetry had died out save in a few places—Narbonne, Rodez, Foix and Astarac—where it kept burning feebly for a little longer. In the 14th century compositions were more and more commonly sung, and the productions of these period are mainly works for instruction and edification, translations from Latin or sometimes even from French, with an occasional romance. As for the poetry of the troubadours, it was dead for ever.

Form.—Originally the poems of the troubadours were intended to be sung. The poet usually composed the music as well as the words; and thus composed he owed his fame more to his musical than to his literary ability. Two manuscripts preserve specimens of the music of the troubadours, but, though the subject has been recently investigated, we are hardly able to form a clear opinion of the originality and of the merits of these musical compositions. The following are the principal poetic forms which the troubadours employed. The oldest and most usual generic term is vers, by which is understood any composition intended to be sung, no matter what the subject. At the close of the 12th century it became customary to call all verse treating of love canso—the name vers being then more generally reserved for poems on other themes. The sirventesc differs from the vers by the canso by its subjection to the musical forms used in the troubadour music. Peire Cardinal is celebrated for the sirventescs he composed against the clergy of his time. The political poems of Bertran de Born are sirventescs. There is reason to believe that originally this word meant poems which were to be sung, and that it was intended to mark the taste in turn. The partimen (Fr. jeu parti) is also a poetic debate, but it differs from the tension in so far that the range of debate is limited. In the first stanza one of the partners proposes two alternatives between which the other party is to decide; whatever he decides, it, the opposite side remaining to be defended by the original proposer. Often in a final couplet a judge or arbiter is appointed to decide between the parties. This poetic game is mentioned by William of Poitiers, and a higher state of civilization prevented a similar profusion of tales of war and heroic deeds. Provencal literature has some highly important specimens of this class. The first place belongs to Girart de Roussillon, a poem of ten thousand verses, which relates the struggles of Charles Martel with his powerful
vassal the Burgundian Gerard of Roussillon. It is a literary production of rare excellence and of exceptional interest for the history of civilization in the 11th and 12th centuries. *Gerard de Roussillon* belongs only within certain limits to the literature of southern France, since the cycle of Charlemagne was made on the borders of Limousin and Poitou; but it is clearly no more than a recast of an older poem no longer extant, probably either of French or at least Burgundian origin. To Limousin also seems to have been confined the cycle of Dalmas, which has been lost.

From the south of France the novel spread into Catalonia, where we find in the 14th century a number of novels in verse very similar to the Provencal ones, and into Italy, where in general the form of the novel had long since been lost.

**Didactic and Religious Poetry.**—Compositions intended for instruction, correction and edification were very numerous in the south of France as well as elsewhere, and, in spite of the enormous amount of them, much still remains. But it is seldom that such works have much originality or literary value. Originality was naturally absent, as the aim of the writers was mainly to bring the teachings contained in Latin and the Bible into popular language. The difficulty of the subject was not of course excluded by the lack of originality, but by an unfortunate chance the greater part of those who sought to instruct or edify, and attempted to substitute moral works for secular productions in favour with the people, were, with a few exceptions, persons of limited ability. It would be out of question to enumerate here all the didactic treatises, all the lives of saints, all the treatises of popular theology and morals, all the books of devotion, all the pious canticles, composed in Provencal verse during the middle ages; still some of these poems may be singled out.

Daude de Prades (early 13th century), a canon of Maguelone, and at the same time a troubadour, has left a poem, *Auxels cassadors*, which is the survival of a whole genre. William of Avesnes (early 12th century), otherwise unknown, translated in verses, about the year 1200, Roger of Parme’s *Surgery* (*Romani*, x. 63 and 496). We may mention also a poem on astrology by a certain G. Guihem de Limousin, and a *Livre de la santé liturgique* already mentioned of the end of the 13th century (*Romani*, xxvi. 825).

As to moral compositions, we have to recall the Boethius poem (unfortunately a mere fragment) already mentioned as one of the oldest documents of the art of poetry. In the 12th century we find several *Tria Sulphur* (12th century?!) metrical translation of the famous *Dithica de moribus* of Dionysius Cato (*Romani*, xxv. 98, and xx. 445). More original are some compositions of an educational character enacting the teaching of St Thomas the Apostle, St John the Evangelist, St Peter, &c., comparable to the English nurture-books. The most interesting are those of Garin le Brun (12th century), Arnaut de Mareuil, Arnaut Guilhem de Marsan, Amanieu de Sascas. Their general object was to edify the soul, and to instruct the religious on the life of the saints. We possess about a dozen (see *Histoire littérale de la France*, vol. xxxii.), among which two or three deserve a particular attention: the life of Sancta Fides, recently discovered and printed *Romani*, xxv. 106 (12th century), which is the survival of a whole genre. St St Enimia (13th century), by Bertran of Marseilles, and that of St Honorat of Lerins by Raimon Feraud (about 1300), which is distinguished by variety and elegance of versification, but it is almost certain that it is not a translation. The story of St Andrew, St Stephen, St Thomas the Apostle, St John the Evangelist, form a part of a poem, strictly didactic, which stands out by reason of its great extent (nearly thirty-five thousand verses) and the somewhat original style and grace of its fragments, etc. *Auctores ordinum religiosorum* is a vassal of the same class, though it is still an encyclopaedia, on a theological basis, composed by the Minorite friar Matre Ermengaut of Béziers between 1288 and 1300 or thereabout.

**Literature.**—The dramatic literature of southern France belongs entirely to the religious class, and shows little originality. It consists of mysteries and miracle plays seldom exceeding two or three thousand lines, which never developed into the enormous drama of the north, France whose 12th required several consecutives plays. Comic verse so plentiful in medieval French literature *farces, sohties*, do not seem to have found favour in the south. Specimens which we possess of Provencal drama are comparatively few; but researches in local archives, especially those of the county of Daudes, have supplied a tolerable number of entries concerning the acting, at public expense, of religious plays, called, in Latin documents, *ludus, historia, moralitas*, most of which seem to be irretrievably lost. As all the Provencal plays belong to the 13th century, they were preserved in about a dozen manuscripts, unearnt until the last forty or fifty years, there is hope that new texts of that sort may some day be published.

Generally those plays belong to the 15th century. Different types are preserved. The 16th belongs to the 14th century or to even the end of the 13th. The oldest appears to be the *Mystery of St Agnes* (edited by Bartsch, 1869), written in Arles. Somewhat more recent, but not later than the beginning of the 16th century is the *Mystery of the Marriage of the Virgin*, edited by Bartsch, 1872. *Mystère de la Noblesse* contains the original *Mystery of the Marriage of the Virgin* (edited by Bartsch, 1869), written in Arles. Somewhat more recent, but not later than the beginning of the 16th century is the *Mystery of the Marriage of the Virgin*, edited by Bartsch, 1872. *Mystère de la Noblesse* contains the original *Mystery of the Marriage of the Virgin*, edited by Bartsch, 1872. *Mystère de la Noblesse* contains the original *Mystery of the Marriage of the Virgin*, edited by Bartsch, 1872.
Marseille, 1858). The region comprised between the Rhone and the Var seems to have been particularly fond of representations of this sort, to judge by the entries in the local records (see *Romania* xxvii. 400). At the close of the 15th and the beginning of the 16th points of manysuchies were played, also the *Doramas de XIII siecle en vieux provençal*, ed. by F. Armitage, Heilbronn, 1884). About the same time, in Limousin, were translated chapters xiii.—xvii. of St John’s Gospel (Bartsch, *Christosthmathe provençale*). The Narratives of the Old have been done in Languedoc and Provence during the 13th and 14th centuries (see S. Berger, “Les Bibles provençales et vaudaises,” *Romania* xviii. 353; and “Nouvelles recherches sur les Bibles provençales et catalanes,” *Romania* xix. 509). The Bibles have been the work of troubadours and some lives of saints may be in the early part of the 13th century (*Revue des langues romanes*, 1890) is more interesting from a purely linguistic than from a literary point of view. To the 13th century belong certain lives of the troubadours interweaving epic and devotional elements, some of which were written before 1250, when the first anthologies of troubadour poetry were compiled; and some are the work of the troubadour Hugh of Saint Chréz. Some were composed in the north of 18th century. The most remarkable of these poems is *Le Retour de Sainte Marie de l’Alpe*, and *La Veuve* (ibid. 1883). The *Doramas* of Hugh Faidit, a writer otherwise unknown, who drew up his purely grammatical work at the request of two natives of northern Italy. A remarkable work, both in style and thought, is *Le Retour de Sainte Marie de l’Alpe*. It possesses the collection of the 15th century (*Flors de vers prensis*). The *Doramas* were written by the troubadours of the south of France, in the 14th century, and a large part of the 15th (*Flors del gay sober*). Unfortunately they are rather academic than poetic. The *Doramas* were a sort of anthology, and are translated into Latin and French also in number. The leading prose works of this period is the *Treatise on Grammar*, poetry and rhetoric known by the name of *Leys d’amors*. It was compiled in Toulouse, shortly before 1324. Another important work is *Les Doutes d’un vieil homme*, of the 14th century, and a large part of the 15th (*Flors del gay sober*). Unfortunately they are rather academic than poetic. The *Leys d’amors*, which was to be the starting-point and rule of the troubadour era, is by now the backbone of troubadour literature. The *Doramas* of the troubadours are divided into two main groups: the troubadours of the south of France, and the troubadours of the north of France, or with Ramon Muntau in Catalonia. The 14th and 15th centuries were in no respect a prosperous period for literature in the south of France. In the 15th century, however, troubadour literature was a renaissance from that time Provencal literature became a thing of the past. From the 16th century such poetry as is written in the vernacular of southern France (Auger Gaillard, La Bellaudere, Goulain, d’Astros, &c.), is entirely dependent on French influence. The troubadour literature is taken up again.

BIBLIOGRAPHY.—Fauvel, *Histoire de la poésie provençale* (Paris, 1826, 3 vols. 8vo), is quite antiquated. Not only are there three-quarters of the works in Provencal poetry ignored, but the very idea of the *Histoire littéraire de la France*, by Gignoux, E. David, &c., must be consigned to the same fate. The articles on the troubadours in the *Histoire littérale de la France*, by Gignoux, E. David, &c., must be consigned to the same fate. The articles on the troubadours in the *Revue des langues romanes* (Montpellier, 1883, 8vo) are quite antiquated. of some kind. In 1573 French poems were first admitted in the 
competitions, and under Louis XIV. (from 1679) these were 
already held eligible. This unfair arrangement, by which 
some of the leading poets of northern France profited, held 
good till 1893, when the town very properly transferred its 
patronage to a new Escole mourdino,
but very soon restored its support to the older institution, on learning that Provençal 
poetry was again to be encouraged.] In the two centuries that 
followed the glorious medieval period we have a succession of 
works, chiefly of a didactic and edifying character, which 
scarcely belong to the realm of literature proper, but at least 
served to keep alive some kind of literary tradition. This 
seedy interval was relieved by a number of religious mystery 
plays, which, though dull to us, probably gave keen enjoyment 
to the people, and represent a more popular genre; the 
latest that have come down to us may be placed 
between the years 1450–1515. Not only did the literature 
deteriorate during this period, but dialects took the place of the 
uniform literary language employed by the troubadours, while 
the spoken tongue yielded more and more to French. In 1539 
François I. forbade the use of Provençal in official documents— 
a fact that is worthy of note only as being significant in itself, 
not as an important factor in the decadence of Provençal 
letters.

On the contrary, just about this time there are signs of a 
revival. In 1565 the Gascon, Pey de Garros, translated the 
Old Testament into his dialect, and two years later published a volume of 
poems. His love for his native tongue is genuine, and his 
cover letter does not bear on it considerable; he deposes its neglect, and urges 
others to follow his example. The Gaillarca (c. 1560–1595) 
does, indeed, bear it to the province: the popularity of his 
liturgical pieces was probably due to their obscurity. More in the 
spirit of Garros is the charming trilingual Salut composed by 
the famous du Bartas in honour of a visit of Marguerite de Valois 
and her children to Nérac (1579): three nymphs dispute as to whether she should 
be welcomed in Latin, French, or Gascon, and the last, of course, 
wins the day. Provençal provence gave birth to a poet of considerable 
importance in Louis Bellaud de la Bellaudière (1532–1588), 
of Grasse, who, after studying at Aix, enlisted in the royal army, 
and was made a prisoner at Moulins in 1572. During his 
captivity he wrote poems inspired by real love of liberty and of 
his native country (Don Don intemre, 1584 or 1585). At Aix Bellaud 
subsequently became the centre of a literary circle which included 
most of the local celebrities; all of these paid their tribute to 
the poet’s memory in the edition of his works published by his 
uncle, Pierre Paul, himself the author of pieces of small value, 
included in the same volume (Lous Passatens, obres et rimes, 
Marseille 1599). Even when Bellaud is wholly frivolous, and intent on worldly pleasures only, his work has interest as 
reflecting the merry, careless life of the time.

A writer very popular in Provençal for the light-hearted 
productions of his youth was Claude Brueys (1570–1659), 
remarkable chiefly for comedies that dealt largely with 
upturned husbands (Jardin deus musos provensalos, not published till 
1628). There is a certain charm, too, in the comedies of Claude’s 
disciple, Gaspard Zerba (La Perlo deus musos et comedies 
provensalos, 1653); and those critics who have the plays of 
Jean de Cabanes (1653–1712) and of Seguin (of Tarascon, 
c. 1650), still in MS, speak highly of them. The most consistently 
popular form of poetry in the south of France was always the 
noel. There has been no limit to the production of these; but 
very rarely does the author deserve special mention. An 
exception must be made in the case of Nicolas Sabex (1614– 
1657), who produced the best pieces of this class, both as regards 
beauty of language and the devotion they breathe. They have 
deservedly maintained their popularity to the present day. In 
Languedoc four poets have been cited as the best of the age— 
Gouldelin, Michel, Sage and Bonnet. This is certainly so in the case of 
Pierre Gouldelin (province Goudouli, 1570–1649), of Toulouse, 
the most distinguished name in south French literature

1. Mournino, i.e. of Toulouse: a common designation, derived 
from Raymond, the familiar name of the counts of Toulouse.

between the period of the troubadours and that of Jasmin. He had a good classical education, 
traces of which appear in all his poetry, his language and his manner being always admirable, 
even where his matter is lacking in depth. He is often 
called "the Malherbe of the South," but resembles that writer 
only in form: his poetry, taken as a whole, has far more sap. 
Gouldelin essayed and was successful in almost every short 
genre (Lou Ramelet Moundi, 1671, republished with additions 
till 1678), the piece of his which is most generally admired being 
the stanzas to Henri IV., though others will prefer him in his 
gayer moods. He enjoyed enormous popularity (extending 
to Spain and Italy), but never prostituted his art to cheap 
effects. His influence, especially but not exclusively in Provençal, 
has been deep and lasting. The fame of Jean Michel, of Nimes, 
rests on the Embarras de la joie de Beaucaire, a poem of astonishing 
vigour, but deficient in taste. Daniel Sage, of Montpellier 
(Les Poules, 1650), was a man of loose morals, which are 
reflected in nearly all his works: his moments of genuine inspiration 
from other causes are rare. More worthy of being bracketed 
with Gouldelin is the avocat Bonnet, author of the best among the 
open air plays that were annually performed at Béziers on Ascension Day: a number of these (dated 1616–1657) were 
subsequently collected, but none can compare with the opening 
one, Bonnet’s Jugement de Paris. Another very charming poet 
is Nicolas Fizes, of Frontignan, whose vaudville, the Opéra de 
Frontignan (1670), dealing with a slight love intrigue, and an 
idiolc poem on the fountain of Frontignan, show a real poetic 
gift. A number of Toulouse poets, mostly laureats of the 
Academy, may be termed followers of Gouldelin: of these 
François Boudet deserves mention, who composed an ode, 
Le Trinfe de la Moundi (1679), in honour of his native dialect. 
The classical revival that may be noted about this time is also generally 
attributed to Gouldelin’s influence. Its most distinguished 
representative was Jean de Valès, of Montpelier, who made 
exc.ellent translations from Virgil and Persius, and wrote a 
brilliant burlesque of the former in the manner of Scarron 
(Virilage deguisat, 1645; only four books published). He also 
composed a pastoral idyll, which, though too long and inclined to 
obscenity, contains much tender description. The greatest of 
the pastoral poets was François de Cordet, of Prades, whose comedies, 
Rameulet and Rimamound (published, unfortunately with alterations, by his son in 1684), 
are written with such true feeling and in so pure a style that they can be 
read with real pleasure. A comedy of his dealing with Sancho 
Panza in the palace of the Duke has been edited. It is difficult 
to understand the enormous popularity of Daubasse (1604– 
1737), of Quercy, who belonged to the working classes; he was 
patronized by the nobility in exchange for patronizes. Gascony, 
produced two typical works in the 17th century: Ader’s Gentil- 
homme gascoun (1610) and Dastros Trinfe de la langue gascoun 
(1642). The former depicts a regular boasting Gascon who 
distinguishes himself in everything; while the latter is a plea 
in favour of the Gascon tongue, inspired by a genuine love of 
country. Gabriel Bedout (Porterie gascoun, 1642) is chiefly 
noted for his amorous solitarii, called forth by the sufferings he endurred from a hardhearted mistress. Louis Baron (b. 1612), 
living peacefully in his native village of Pouloubrun, celebrated it 
with great tenderness. In the 18th century the number of authors is much larger, 
but the bulk of good work produced is not equally great in 
proportion. The priests are mainly responsible for the literary 
output of Languedoc. Claude Peyrot (1709–1795) one of 
them, was patronized by the nobility and exchanged for patronizes. But the chief of the band is the 
Abbé Favre (1727–1783), the rival of Cellenueve, whose Sormoun 
de moussu sivre, delivered by a drunken priest against 
temperance, is a masterpiece. He also wrote a successful mock-heroic 
poem (Sieté de Caderson) travesties of Homer and Virgil, 
a prose novel depicting the country manners of the time (Histoire 
de Jean l’ont pris), and two comedies, which likewise give a vivid 
picture of the village life he knew so well. Two genuine poets 
are the brothers Rigaud of Montpellier: Auguste’s (1760–1835)
description of a vintage is deservedly famous; and Cyrille (1750–
1831) produced an equally delightful poem in the Amour de Mounpêdi; Pierre Hellies of Toulouse (d. 1774) a poet of the people, whose vicious life leads an echo in his works, has a certain rude charm, at times distantly recalling Villon. In the Province Toussaint Gros (1698–1748), of Lyons, holds undisputed sway. His style and language are admirable, but unfortunately he wasted his gifts largely on trivial pièces d'occasion. Coye's (1711–1777) comedy, the Fiancé paré, is bright and still popular, while Germain's description of a visit paid by the ancient gods to Marseilles (Le Bourrœil des Deûs, 1760) has considerable humour. In Gascony the greatest poet is Cyrin Despouirris (1678–1759), whose pastoral idylls and mournful chansons, which he himself set to music, are imbued with tenderness and charm (most of them were collected at Pau, in 1828).

The Revolution produced a large body of literature, but nothing of lasting interest. However, it gave an impetus to thought in the south of France, as elsewhere; and there, as elsewhere, it called forth a spirit of independence that was all in favour of a literary revival. Scholars of the stamp of Raynouard (1761–1863), and Rabaud, occupied themselves with the brilliant tradition of the middle ages; that of which sprang up (the Provençal Bouil-Aboise, started by Désanet, and the bilingual Lou Tambourin et le menestrel, edited by Bellot, both in 1841); poets banded together and collected their pieces in volume form (thus, the nine troubadours who published Lou Bouquet provençau in 1823). Much has been written about the précurseurs of Félibrige, and critics are sorely at variance as to the writers that most deserve this appellation. We shall not go far wrong if we include in the list Hyacinthe Morel (1756–1820), of Avignon, whose collection of poems, Lou Sabolet, has been republished by Mistral; Louis Aubanel (1758–
1841), of Nimes, the successful translator of Anacreon's Odes; Auguste Tandon, "the troubadour of Montpellier," who wrote Fables, contes et autres pièces en vers (1800); Fabre d'Olivet (1767–1825), the versatile littérateur who in 1803 published Le Troubadour: Poésies occitaniques, which, in order to secure their success, he gave out as the work of some medieval poet Duoloufet (1771–1840), who wrote a didactic poem, in the manner of Virgil, relating to silkworm-breeding (Les magnans); Jacques Azail (1750–1810), author of satires, fables, &c.; D'Astros (1780–
1863), a writer of fables in Laffontaine's manner; Castil-Blaze (1804–1857), who found time, amidst his musical pursuits, to compose Provençal poems, intended to be set to music; the Marquis de Fare-Alis (1791–1846), author of some light satirical tales (Les Castagnados). While these writers were all more or less academic, and appealed to the cultured few, four poets of the people addressed a far wider public: Verdié (1777–1820), of Bordeaux, who wrote comic and satirical pieces; Jean Reboul (1796–1864), the baker of Nimes, who never surpassed his first effort, L'Ange et l'enfant (1828); Victor Gelu (1806–1885), relentless and brutal, but undeniably powerful of his kind (Péran et Grosman; dix chansons provençales, 1840); and, greatest of them all, the true and acknowledged forerunner of the félibres, Jacques Jasmin (1798–1864), the hairdresser of Agen, whose poems, both lyrical and narrative, continue to find favour with men of the highest culture and literary attainments, as with the villagers for whom they were primarily intended.

While much of this literary was still in the making, an event took place which was destined to eclipse in importance any that had gone before. In 1845 Joseph Roumanille (1818–1841), a gardener's son, of Saint-Remy (Bouches-du-Rhône), became usher in a small school at Avignon, which was attended by Frédéric Mistral (q.v.), a native of the same district, then fifteen years of age. The former, feeling the germs of poetry within him, had composed some pieces in French; but, finding that his old mother could not understand them, he was greatly distressed, and determined thenceforth to write in his native dialect only. These poems revealed a new world to young Mistral, and spurred him on to the resolve that became the one purpose of his life: de remettre en lumière et conscience de sa gloire cette noble race qu'en plein '89 Mirobeau nomme encore la nation provençale. There is no doubt that Mistral's is the more puissant personality, and that his finest work towers above that of his fellows; but in studying the Provençal renaissance, Roumanille's great claims should not be overlooked, and they have never been put forward with more force than by Mistral himself (in the preface to his Isols d'or). Roumanille's secular verse cannot fail to appeal to every lover of pure and sincere poetry (La Margaritado, 1836–1847; Li Sounjarello, 1823; Li Plour de Sauwi, 1850–
1859, &c.), his noëls are second only to those of Saboly, his prose works (such as Lou mege de Cuchugan, 1863) sparkling with delightful humour. He was who in 1852 collected and published Li Provençau, an anthology in which all the names yet to become famous, and most of those famous already (such as Jasmin), are represented. In 1855 he was one of the enthusiastic circle that had gathered round J. B. Gaut at Aix, and moulded the literary output contained in the Roumassau dei Trou- baire, and the short-lived journal Lou gue de sober (1854). At the same time the first attempt at regularizing the orthography of Provençal was made by him (in the introduction to his play, La Port dou bon Dieu, 1853). And in 1854 he was one of the seven poets who, on the 21st of May, foregathered at the castle of Fontsegane, near Avignon, and founded the Félibrige. [The etymology of this word has given rise to much speculation: the one thing certain about the word is that Mistral came across it in an old Provençal poem, which tells how the Virgin meets Jesus in the Temple, among the seven félibres of the law. The outlines of the constitution, as finally settled in 1876, are as follows: The region of the Félibrige is divided into four mantencenç (Provence, Languedoc, Aquitaine and Catalonia). At the head of all is a consistori of fifty (called maugeoren), presided over by the Capouli, who is chief of the entire Félibrige. The head of each maintenç is called sendi (who is at the same time a maugeoren); and at the head of each"school" (as the subdivisions of the maintenç are called) is a cabiscou. The ordinary members, unlimited in number, are maintencenso. Annual meetings and félibrige of poetry. One of the widest-spread Félibrige publications is the Armana provençau, which has appeared annually since 1855, maintaining all the while its original scope and purpose; and though unpretentious in form, it contains much of the best work of the school.\footnote{1} The other six were Mistral, Aubanel, A.Mathieu (a schoolfellow of Mistral's at Avignon), E. Garcin, A. Tavan and P. Giera (owner of the castle). Of these, Théodore Aubanel (1829–1886, of Avignon, son of a printer and following the same calling) has alone proved himself worthy to rank with Mistral and Roumanille. "Zani," the girl of his youthful and passionate love, took the veil; and this event cast a shadow over his whole life, and determined the character of all his poetry (Lou milugaro entre-duberto, 1860; Li Fico d'Avignon, 1883). His is, without a doubt, the deepest nature and temperament among the félibres, and his lyrics are the most poignant. He has a keen sense of physical beauty in woman, and his verse is replete with suppressed passion, but never sinks to sensuality. His powerful love drama Lou pau dou perder (1873) was received with enthusiasm at Montpellier in 1878, and successfully produced (some years later in Azèche's version) by Antoine at his Théâtre Lëbre—no mean criterion. It is the only play of real consequence that the school has yet produced.

We need not do more than glance at the work of the fourth of the group of poets who alone, amidst the numerous writers of lyrics and other works that attain a high level of excellence.\footnote{2} One of the most pleasing features of the movement is the spirit of fraternity maintained by the félibres with the poets and literary men of northern France, Spain, Italy, Rumania, Germany and other countries.\footnote{3} In common with so many other productions of the Félibrige, this Almanac is published by the firm J. Roumanille, Libraire-Editeur, Avignon.
appear to us to have so far secured permanent fame by the magnitude of their achievement. Félix Gras (1844–1891) settled at Avignon in his youth. His rustic epic, *Li Carbounié* (1876) is full of elemental passion and abounds in fine descriptions of scenery, but it lacks proportion. The heroic *geste de Tolosa* (1882), in which Simon de Montfort’s invasion of the south is depicted with unbounded vigour and intensity, shows a great advance in art. *Li Roumancre provençal* (1887) is a collection of poems instinct with Provençal lore, and in *Li Papalino* (1891) we have some charming prose tales that bring to life again the Avignon of the popes. Finally, the poet gave us three tales dealing with the period of the Revolution (*Li Rouge dou mieux, &c.*); their realism and literary art called forth general admiration.¹

A few lines must suffice for some of the general aspects of the movement. It goes without saying that all is not perfect harmony; but, on the whole, the differences are differences in detail only, not of principle. The best *félises* employ the dialect of the Bouches-du-Rhône, others, who have since seceded as the *Félise latín* (headed by Roque-Ferrier), prefer to use the dialect of Montpellier, owing to its central position. A third class favour the dialect of Limousin, as having been the literary vehicle of the troubadours; but their claim is of the slenderest, for the *félises* are in no sense of the word the direct successors of the troubadours. Nearly all the leaders of the *Félise* are Legitimists and Catholics, their faith being the simple faith of the people, undisturbed by philosophic doubts. There are exceptions, however, chief among them the Protestant Gras, whose *Tolosa* clearly reflects his sympathies with the Albigenes. Yet this did not stand in the way of his election as *Capouli*; a proof, if proof were needed, that literary merit outweighs all other considerations in this artistic body of men. Finally, it may be noted that the *félises* have often been accused of lack of patriotism towards northern France, of schemes of decentralization, and other heresies, but none of these charges holds good. The spirit of the movement, as represented by its leaders, has never been expressed with greater terseness, force and truth than in the three verses set by Félix Gras at the head of his *Carbounié*:

> "I love my village more than thy village; I love my Provence more than thy province; I love France more than all."

**PROVENCE** (Provincia, Provenza), a province in the south-east of ancient France, bounded on the N. by the Dauphiné, on the E. by the Rhône and Languedoc, on the W. by the Alps and Italy, and on the S. by the Mediterranean. The coast, originally inhabited by Ligurians, was from an early date the home of some Phoenician merchants. About 600 B.C., according to tradition, some traders from Phocaea founded the Greek colony of Massalia (Marseille) and the colonists had great difficulty in resisting the Cavares and the Salyes, i.e. the Ligurian peoples in the vicinity. Other colonies in the neighbourhood, such as Antibes, Agde, Nice, originated in this settlement. During the wars which followed, the inhabitants of Massalia asked assistance from the Romans, who thus made their first entry into Gaul (235 B.C.), and, after a campaign which lasted several years under the

¹ Gras was *Capouli* from 1891 till 1901, succeeding his brother-in-law, Roumanie, who held the office from 1888 till 1891. The first *Capouli* was, of course, Mistral (1857–1888). Gras’s successor was Pierre Delpeyr, of Die (appointed in April 1901).
the government to his brother-in-law, Duke Boso, who, taking advantage of the struggles between the Frankish princes which followed the death of Charles the Bald, reconstituted the former kingdom of Charles, the son of Lothair, and in 870 was acknowledged as its sovereign at Mantaile in Viennois. This is the kingdom of Provence (Provence, Viennois, Lyonnais and Vivarais), sometimes, but improperly, called Cisjurana Burgundy.

Boso died in 887, having succeeded in maintaining his independence against the united Frankish princes. His widow Ermengarde, daughter of Louis II., with the assistance of the emperor Arnulf, had her son Louis acknowledged king at an assembly held at Valence in 890. Louis attempted to seize the crown of Italy in 900, and in 901 was even crowned emperor at Rome by Pope Benedict IV.; but in 905 he was surprised at Verona by his rival Berengar, who captured him, put out his eyes, and forced him to give up Italy and return to Provence; he lived here till his death in 928, leaving an illegitimate son, Charles Constantine. The principal figure in the country at this time was Hugo (Hugues) "of Arles," count, or duke, of Viennois and marquis of Provence, who had been king of Italy since 926. In order to retain possession of this country, he gave the kingdom of Louis the Blind to Rudolph II., king of Burgundy (936), and thus the kingdom of Burgundy extended from the source of the Aar to the Mediterranean. But the sovereignty of Rudolph II. and his successors, Conrad (937-993) and Rudolph III. (993-1032), over Provence was almost purely nominal, and things were in much the same condition when, on the death of Rudolph III., the kingdom of Burgundy passed into the hands of the German kings, who now bore the title of kings of Arles, but very rarely exercised their authority in the country.

At the beginning of the 10th century Provence was in a state of complete disorganization, a result of the invasions of the Saracens, who, coming from Spain, took up their quarters in the neighbourhood of Fraxinetum (La Garde-Freinet in the department of Var) and ravaged the country pitilessly, the Christians being unable to oust them from their strongholds. All the real power now lay in the hands of the counts of the country. It is probable that from the 9th century several of the Provencal counts were united under one count, and that the count of Arles had the title of duke, or marquis, and exercised authority over the others. In the middle of the 10th century the countship of Provence was in the hands of a certain Boso, of unknown origin, who left it to his two sons William and Roubaud (Rotbold). These two profited by the commotion caused by the capture of the famous abbots of Cluny, St. Mailois (Mayeul), in 973, who had fallen into the hands of the Saracens, and marched against the Mussulmans, definitely expelling them from Fraxinetum. About the same period the marquisate seems to have been re-established in favour of Count William, who died in 993, and from that time the descendants of the two brothers, without making any partition, ruled over the different countships of Provence, only one of them, however, bearing the title of count of Provence. From about the middle of the 11th century, a tendency to add the name of their usual residence after their title, and thus the lordsbords, known later under the names of the countships of Arles (or more properly Provence), of Nice, and of Venaisin, grew up. Roubaud had one son named William, who died without children, about 1043, and one daughter, Emma, who married William, count of Toulouse, by whom she had a son, Pons (1030-1063), the father of Raymund of Saint-Gilles (1063-1105). William also had a son of the same name. This William II. had three sons by his wife Gerberge—Fulk, Geoffrey and William. The last-mentioned had a son, William Bertrand (1044-1067), whose daughter Adelaide married, first, Ermenegald, count of Urgel, and then Raimbaut of Nice. Geoffrey was the father of Gerberge, who married Gilbert, count of Gévaudan, and he had a daughter Douce, who in 1112 married Raymund-Bérenger, count of Barcelona; by this marriage, Provence, in the correct sense of the word, passed over to the house of Barcelona. At the beginning of the 12th century the various marriages of the Provencal heiresses, of whom mention has just been made, led to the land being divided up among the different branches of the ancient countly family (1105, 1125 and 1140), and thus the countships of Provence, Venaisin and Forcalquier were definitely formed.

Under the command of Raymund of Saint-Gilles the Provençals took an important part in the first crusade, and the use of the term "Provençal" to denote the inhabitants of southern France, their language and their literature, seems to date from this period.

The history of the princes of the house of Barcelona, Raymund-Bérenger I. (1113-1137), Raymund-Bérenger II. (1131-1144) and Raymund-Bérenger III. (1144-1166), is full of accounts of their struggles with the powerful feudal house of Baux, which had extensive property in Provence; in 1146 one of the representatives of this house, Raymund, obtained from the emperor the investiture, though only in theory, of the whole countship of Provence. After the death of Raymund-Bérenger III., who was killed at the siege of Nice (1166), his cousin Alphonso II., king of Aragon, claimed his inheritance and took the title of the count of Provence. But his succession was disputed by the count of Toulouse, Raymund V., a marriage having been previously arranged between Raymund-Bérenger's daughter and his son, and he himself hastening to marry the widow Richilde, niece of the emperor Frederick I. The majority of the lay and ecclesiastical lords of Provence recognized Alphonso, who in 1176 signed a treaty with his competitor, by which Raymund V. gave up his rights to the king of Aragon in consideration of a sum of money. Alphonso was represented in Provence by his brothers Raymund-Bérenger and Sancho in turn, and in 1193 by his son Alphonso, who succeeded him. This Alphonso gave Aragon and Catalonia to his brother Peter (Pedro), and kept only Provence for himself, but on the death of his father-in-law, Count William II., in 1208, whose son had been disinherited, he added to it the county of Forcalquier. He was able to protect Provence from the consequences of the war of the Albigenses, and it was not till after his death (1209), during the minority of his son Raymund-Bérenger IV., who succeeded him under the regency of his uncle, Peter of Aragon, and later of his mother Gersende, that Provence was involved in the struggle of the count of Toulouse against Simon de Montfort, when the part played by the city of Avignon in the Albigensian movement finally led to Louis VIII.'s expedition against the town. William of Baux took advantage of the troubles caused by Raymund-Bérenger's minority to have the kingdom of Arles conferred upon himself by Frederick II.; this led, however, to no practical result. Raymund-Bérenger had also to fight against Raymund VII., count of Toulouse, the emperor having ceded to this latter in 1230 the countship of Forcalquier, and showed another mark of his favour in 1238, when, in consequence of some difficulties with the city of Arles, Raymund-Bérenger drove the imperial vicar from the town. The intervention of St. Louis, who in 1234 had married Margaret, the eldest daughter of the count of Provence (the second, Eleanor, married Henry III. of England in 1236), put an end to the designs of the count of Toulouse. Raymund-Bérenger died in 1245, leaving a will by which he named as his heiress his fourth daughter, Beatrice, who shortly afterwards, in 1246, married the celebrated Charles of Anjou (see CHARLES I., king of Naples), brother of the king of France. After her death, in 1267, Charles still maintained his rights in Provence. The countship of Venaisin was left to him by his sister-in-law, Jeanne, countess of Toulouse, but in 1272 King Philip the Bold took possession of it, giving it up in 1274 to Pope Gregory X., who had claimed it for the Roman Church in pursuance of the treaty of 1229 between Raymund VII. of Toulouse and St Louis. Almost all the time and energy of Charles of Anjou were taken up with expeditions and wars concerning the kingdom of Naples, which he had gained by his victories over Manfred and Conradin in 1266 and 1268. His government of Provence was marked by his struggles with the towns. The movement which resulted in the emancipation of these had its origin fairly far back. In the first part of the 12th century the towns of Provence, no
doubt following the example of those in Italy, began to form municipal administrations and consulates, independent of the viscounts, who in theory represented the authority of the count in the towns. This movement was occasionally interrupted by home disturbances, such as struggles against the civil and ecclesiastical authorities; nevertheless, Marseilles, Arles, Tarascon, Avignon (whose consulsial laws date from the 12th century), Brignoles and Grasse were self-governing and elected their magistrates, sometimes negotiating with the count, as a power with a power, and concluding political or commercial treaties without consulting him. The city of Nice, which was joined to Provence in 1175, had retained its freedom. This state of affairs was in direct opposition to the authoritative government of Charles of Anjou, who tried to bring back the most independent of these towns under his sway. In 1232 he seized Arles and Avignon and placed them under a viscount (vice) nominated by him. His successor in 1258 was also subdued, and ministers nominated by the court performed their duties side by side with the municipal officials.

The successors of Charles of Anjou also showed great interest in maintaining their rights over the kingdom of Naples, and only occasionally do they appear in the history of Provence. Charles II. (1285-1309), after failing in several attacks on the house of Aragon in southern Italy, lived in the country during the latter years of his reign as duke, and tried to reform some of the abuses which had grown up in the administration of justice and finance. Robert of Calabria (1309-1343), his son and successor, was forced to sustain a long siege in Genoa, whither he had been called by the Ghibelline party: a siege which cost a large number of lives to the Provençal navy. Robert was succeeded by his granddaughter Joanna, widow of Andrew of Hungary, who sold her rights over the city of Avignon to Pope Clement VI. In 1348, in order to raise funds to enable her to continue the struggle against the house of Aragon in her Neapolitan states. The political situation of the country was not much changed by Charles IV.'s residence in Provence, nor by the empty ceremony of his coronation as king of Arles (1365). Charles IV. gave up his rights, or his claims, to Louis, duke of Anjou, brother of Charles V., but the expedition which this prince made to take possession of Provence only resulted in the seizure of Tarascon, and failed before Arles (1368). Joanna had nominated as her heir Charles of Anjou-Gravina, duke of Duras, who had married her niece Margaret, but to provide herself with a protector from Louis of Hungary, who accused her of murdering her first husband Andrew and wished to dispute her right to the kingdom of Naples, she married again and became the wife of Otto of Brunswick. Charles of Duras, discontented with this marriage, took part against her, and she in her turn dispossessed him and named Louis of Anjou as her successor (1380). The duke of Anjou took possession of Provence, whilst Charles of Duras made the queen prisoner at Naples and gave order for her to be put to death (1382). Louis of Anjou also made an expedition to Naples, but did not arrive till after her death, and he died in 1384. His son Louis II. (1384-1417) banished the viscount of Turenne from Provence, because he had taken advantage of his sovereign's absence to ravage the country. He did not live in Provence till the last years of his life; in 1415 he established a parlement. The following year the country was devastated by a terrible plague. The wars carried on by his successor Louis III. (1417-34) against the kings of Aragon, his rivals at Naples, were the cause of the complete ruin of Marseilles by the Aragonese fleet. The town, however, regained its former state comparatively quickly. Although Louis III. had centred almost all his attention on the expeditions in Italy, he managed to secure the lands belonging to the house of Baux on the death of the last of the family, the Baroness Alix (1426). René, duke of Lorraine (q.v.), Louis's brother and successor, after an unsuccessful attack on Naples (1450-1451), went to live on his property in France, and after 1471 was principally in Provence, where he built the castle of Tarascon and interested himself in art, literature, and pastoral amusements. He left his territories (Anjou, Lorraine, Provence) to his nephew Charles, count of Maine, by his will in 1474. Louis XI., king of France, protested at first in the name of the rights of the Crown, and even seized René's duchies. In consequence, however, of an interview between René and the king at Lyons, the former obtained a withdrawal of the seizure and ended his days peacefully in Provence (1480). The rights of his successor, Charles, were disputed by René II., duke of Lorraine, but, with the support of Louis XI., his attack on Provence was defeated. On the other hand, Louis had corrupted some of Charles's advisers, especially Palamède de Forbin, with the result that, at Charles's death in 1482, he left Provence to the king of France in his will. René of Lorraine protested in vain; Louis claimed the possession of the disputed territory, but Provence was not definitely annexed to France till 1486, under Charles VIII., and even then it preserved a certain individuality. In laws relating to this country the sovereigns added to their title of king of France the name of Provence and of Forcalquier, and Provence always preserved a separate administrative organization.

In the 16th century Provence took part in a war between France and the imperialists. The constable de Bourbon, who had received the investiture of Provence from the emperor Charles V., crossed the Var in 1524 with an army, but was defeated at Marseilles. The expedition under Charles V. and the duke of Savoy in 1536 had no more definite result than the coronation of the emperor at Aix as king of Arles. About the same time the first signs of the Reformation became evident in Provence, at first in the country of the ancient Vaudois at Cabrières and at Mèrindol in the county of Venaissin. A sentence passed in 1540 by the parlement of Provence against these heretics was carried out with great severity in 1545 by the president d'Oppède and the baron de la Gard, who burned the villages and massacred the inhabitants. Protestantism did not take a great hold on Provence, but drew a fair number of followers from the ranks of the lesser nobles, who, with Paul de Mauvans at their head, began the struggle against the Catholics under the comte de Carces. Charles IX.'s journey in Provence in 1567, followed by the establishment in the parlement at Aix of a court (chambre) in which Catholics and Protestants had an equal number of seats, led to a momentary cessation of hostilities. These were resumed between the Carcistes (Roman Catholics) and Ranaits (Protestants), and again interrupted by the peace of 1576, which gave some guarantees to the Protestants, with La Seyne as a place of security, and also by the plague of 1579, which affected the whole country. The league, on the other hand, made rapid progress in Provence under the direction of the comte de Sault and Hubert de la Gard, seigneur of Vins, and the governors of Éperon and La Valette vainly tried to pacify the country. La Valette and the political party of Bigarrats were finally more or less reconciled to the Protestants, and, at the time of the death of Henry III., the struggle was no more than a question of district politics. Weakened by the division between the comtess de Sault and the young comte de Carces, the league applied to the duke of Savoy, who was besieging Marseilles. Carces and the other heads of the league submitted one after the other to the new governor Lesdiguières, who was succeeded by the duke of Guise in 1595, and in 1596 the religious wars in Provence were definitely ended by the capitulation of Marseilles.

During the reign of Henry IV. the country was comparatively peaceful; but under Richelieu the restriction of local freedom and the creation of new offices led to the insurrection of the Cascaevens (small bells, a name derived from their rallying sign), which Condé came to suppress in 1630-1631. At the time of the Fronde additional taxes were levied by the parlement of Aix, and the struggle began between the Comites (Mazarins) and the Subserains (vicissims), who captured the governor, the comte d'Alais, for a short time. The duke of Mercœur calmed the country down. Louis XIV.'s tour in Provence (1660) was marked by an insurrection at Marseilles, which brought about the abolition of the last remaining municipal liberties of the town. Provence was severely tried by the
imperialist invasions of 1790 and 1796, and the great plague of
1720. Towards the end of the ancien régime the movement
which resulted in the revolution of 1789 made itself felt in Pro-
vice, and was most apparent in the double election at Aixand
at Marseilles of Mirabeau as deputy for the states-general.

Provence, with its own special language and its law so closely
related to Roman law, has always been quite separate from the
other French provinces. Theoretically it retained its provincial
estates, the origin of which has been traced to the assemblages
of the 12th century. They met annually, and included represen-
tatives of three orders: for the clergy, the archbishop of Aix, president ex officio of the estates, the other bishops of
Provence, the abbots of St Victor at Marseilles, of Montmajour
and of Thoronet; for the nobility, all the men of noble birth
(gentilhommes) until 1623, when this privilege was restricted
to actual holders of fiefs; for the third, the members of the twenty-
two chief towns of the region and of six other places, among which were Arles and Marseilles. There were
theoretically no taxes, but only supplies given freely by the
estates and assessed by them. However, this assembly did not
meet after 1639. The administrative divisions of Provence
were constantly changing. In 1307 Charles II divided it into
two sénéchaussées, Aix and Forcalquier, comprising twenty-two
vigueries. At the end of the ancien régime the government
(gouvernement) of Provence, which corresponded to the généralité
of Aix, was made up of eight sénéchaussées, those of Lower
Provence—Aix, Arles, Marseilles, Brignoles, Héres, Grasse,
Draguignan, Toulon; and four of Upper Provence—Digne,
Sisteron, Forcalquier, Castellane. From a judicial point of
view the parlement of Aix had replaced the former conseil
éminent ou cour souveraine. There was a chambre des comptes
at Aix, and also a cour des aides. A decree, dated the 22nd of
December 1789, divided Provence into the three departements
of Bouche du Rhône, Basses-Alpes and Var, and in 1793
Vaucluse, the former county (comitat) of Venaisin, which
belonged to the pope, was added to these. The boundaries of
the department of Var were modified in 1862 after the annexa-
tion, when the department of the Alpes Maritimes was formed.

AUTHORITIES.—There is no good general history of Provence.
For a complete work consult the ancient works of H. Bouche,
Chorographie et histoire chronologique de Provence (2 vols. in fol.,
Aix, 1780); apothéose générale de Provence (3 vols., Paris,
1777-1778); L. Méry, Histoire de Provence (3 vols. in 8vo,
Marseilles, 1830-1837). For special periods of history see F. Kien,
Verfassungsgeschichte von der Provence, 510-1200 (8vo, Leipzig,
1900); R. Lecomte-Lebard, Le Royaume de Provence (1 vol. in
8vo, Paris, 1901); G. de Manteyer, La Provence du iv° au xiv° siècle
(in 8vo, Paris, 1907); Lambert, Essai sur le régime municipal et
l'administration des communes en Provence (in 8vo, Toulon,
1882); Les proverbes provençaux (2 vols. in 8vo, 1876); and
Reinsberg, Esai historique sur le parlement de Provence (3 vols. in 8vo,
Aix, 1826).

PROVERB (Lat. proverbium, from pro, forth, publicly,
verbum, word; the Greek equivalent is παρομοίων, from παρά,
alongside, and ὁδός, way, road, i.e. a wayside saying; Ger.
Sprichwort), a form of folk-literature, or its later imitation,
expressing, in the form of a simple, homely sentence, a pungent
criticism of life. Many definitions have been attempted of
a "proverb," of which none has met with universal acceptance.
J. Howell's (d. 1666) three essentials, "shortness, sense and
salt," omit the chief characteristic, popularity or general
acceptance, and the definition of Erasmus—"Celebre dictum scita
quibus notabile insigne—suit a good proverb rather than
proverbs in general. Lord Russell's "The wisdom of many
and the wit of one" is familiar.

For a general survey of the subject of proverbs, Archbishop
Trench's Proverbs and their Lessons (new ed., 1905, by A. Smythe-
Palmer, with additions and notes) is useful; it contains a fairly
comprehensive bibliography, ancient and modern. Bohn's Hand-
book of Proverbs, and Polyglot of Foreign Proverbs (1857), based on
the collections of John Ray (1670) and David Ferguson (1641),
are very full. V. Stuckey Lead's Collectanea (5 vols. 1902) is a
storehouse of English proverbs, classified in various ways; Notes
and Queries, 9th series (1898), vol. ii., contains a bibliography
of English works on the subject; the principal foreign works
are G. Stratofo1, La Sapientia del mondo (3 vols., 1883) and Reinsberg
und Düringsfeld, Die Sprichwörter der germanischen und romanischen Sprachen
(2 vols., 1872-1875). There are many popular handbooks giving
full collections of proverbs, English and foreign.

PROVERBS, BOOK OF (Heb. Mishle Shelomoh, "Proverbs of
Solomon," abridged by the later Jews to Mishlé; Septuagint,
papoulaion or II. Σακ.; Lat. Vulg. Parabolae sol. et Liber pro-
verbiurn), one of the Wisdom books of the Old Testament (see
Wisdom Literature) and the principal representative in the
Old Testament of gnomic thought. This sort of thought, which
appears very early in Egypt (2000 B.C. or earlier), and relatively
early among the Greeks (in the sayings of Thales and Socrates
as reported by Diogenes Laertius), was of late growth among the
Hebrews. They, like other peoples, had their simple
proverbs, embodying their general observations of life; a couple
of these have been preserved in the Old Testament: "Is Saul
also among the Prophets?" (1 Sam. x. 12); "The fathers eat
sour grapes, and the children's teeth are set on edge" (Jer. xxxi.
29; Ezek. xlvii. 2). It is possible that Solomon uttered or collected
a number of such sayings, based in part on observation
of the habits of beasts and plants (1 Kings iv. 32 seq. [Heb.v.
12 seq.]; cf. Job's apologue, Judg. ix. 8 sqq., and Samson's
riddle, Judg. xiv. 14). The Hebrew word moshal, commonly
rendered "proverb," is a general term for didactic and elegiac
poetry (as distinguished from the descriptive and the liturgical,
it's form being that of the couplet with parallelism of clauses;
English Testament renders it a folk-saying (Exek. xix. 19,
viiii. 2), an allegory (Exek. xvii. 2), an enigmatical saying
(Exek. xxi. 4), a byword (Jer. xxxv. 9; Deut.xxxvi. 37), a taunting
speech (Isa. xiv. 4; Hab. ii. 6), a lament (Mic. ii. 4), a visionary
or apocalyptic discourse (Num. xxiii. 7; xxiv. 15), a didactic
discourse (Ps. xxi., xxxvii.), an argument or plea (Joh xxix. 1).
In the book of Proverbs it is either an aphorism (x.-xix.) or a
discourse (i.-ix., xxx. 20-35, xxxv. 32-27).

The use of the term being so various, its special significan-
tion in any case must be determined by the character of the passage
in which it occurs; and an examination of the contents of
Proverbs shows that the thought of the book differs widely from
that of the literature prior to the 5th century B.C. The book
appears on its face to be a compilation, various authors being
mentioned in the titles: Solomon in x. 1 and xxv.; the "sages"
in i. 1 and xx. 1; the "former rulers" in xiv. 22-27. Agur in
xxvii. 17, a "proverb" in xxviii. 14, and the mother of King
Lemuel in xxxi. 19; xxviii. 22; and probably, xxx. 5-9, are
anonymous; the ascription in i. 1 to Solomon may refer to
i.-ix. or to the whole book. Apart from the titles (which are
not authoritative) the difference of style in the various
sections indicates difference of authorship. There is, indeed,
a certain unity of thought in the book; throughout it inculcates
cardinal social virtues, such as industry, thrift, discretion,
truthfulness, honesty, chastity, and in general it assumes wisdom to be the
guiding principle of life. But the sections differ in form and
tone. While chs. x.-xxix. and part of xxx. consist of aphorisms
chs. i.-ix., xxx. are composed of more or less elaborate
discourses. In the aphoristic sections there the book is varied; there
are couplets (l.-xxii. 16; xxxvii.-xxxiii.), quatrains (xxxii.-xxxiv.)
and tetrads and other numerical arrangements (xxx. 7-33).
Compilatory character is indicated by repetitions; there are
identical lines (x. 1 and xxvii. 3; xi. 14 and xxiv. 6; xii. 9 and
xxiv. 20; xlv. 1 and xxiv. 3; xv. 18 and xxiv. 22; xvii. 3 and xxvii.
21; xix. 13 and xxvii. 15; xx. 22 and xxiv. 39; xxv. 23 and
xxxvii. 21) and identical couplets (xxxvii. 8 and xxiv. 22; xiv. 1
and xxvii. 6; xiv. 24 and xxvii. 15; xx. 16 and xxvii. 13; xxi. 9
and xxviii. 34; xxviii. 3 and xxvii. 12).

The dates of the various parts of the book must be determined
by the character of the contents, there being no decisive external
data. The fact that it stands in the third division of the Hebrew
Canon, the Writings or Hagiographa, along with such late
works as Job, Psalms, Chronicles, Daniel, Ecclesiastes and
Easter, must be allowed weight; the presumption is that the arrangers of the Canonical books regarded it as being in general later than the Prophetic books. No help can be got from the titles. Examination of titles in the Prophets and the Psalms (to say nothing of Ecclesiastes and Wisdom of Solomon) makes it evident that these have been added by late editors who were governed by vague traditions or fanciful associations or caprice, and there is no reason to suppose the titles in Proverbs to be exceptions to the general rule. The ascription of parts of Proverbs to Solomon (i., x., xxv. i) means nothing for us except that there was a disposition among the later Jews to refer their books to great names of the past, Enoch, Daniel, Job, Moses, David, Solomon, Ezra; as also, outside of Jewry, works were ascribed to Homer, Plato, Aristotle, Tacitus and others that were regarded by them in a similar light. The assumption of a Solomonic authorship for Proverbs is excluded by the whole colouring of the book, in which monothism and mono-
gamy are assumed, without discussion, to be generally accepted, while in Solomon's time and by Solomon's self the worship of many gods and the taking of more than one wife were freely practised, without rebuke from priest or prophet. The high
ethical conception of the kingly office in Proverbs is out of keeping with the despotic character of Solomon's government.

It is supposed, indeed, by some modern writers that the notice in xxv. 1 ("These are proverbs of Solomon, that the men of Hezekiah king of Judah transcribed") is too circumstantial to be merely a late tradition or scribal guess. But similarly doubtless the titles are prefixed elsewhere, for example, to Ps. ii.-ix., where the author is ascribed as "the son of David the king," and these may have been selected by the author of the title (or by the tradition which he represents) as being the next great literary period in Judah after Solomon, the time of Micah and Isaiah, or the selection may have been suggested by the military glory of the period (the repulse of the Assyrian army) and by the fame of Hezekiah as a pious monarch and a vigorous reformer of the national religion.

But to regard Hezekiah as a Jewish Plisistratus is to ascribe to the time a literary spirit of which the extant documents give no hint; the literature of the age was wholly occupied with the past history, the religious conditions and the political fortunes of the nation, subjects alien to the book of Proverbs.

The objections to the Solomonic age as the time of origination of the book apply also to the period extending from Solomon through the same centuries of subsequent history. What are the motives that may lead us to put its origin still later. One of these is the non-
national character of the thought. The historical and propheti-
cal books and the Pentateuch are wholly concerned with the nation. For them Israel is the centre of the world, the point around which all other things revolve—every other people derives its claim to consideration from its relation to Israel—the only subject deserving attention is the extent of the Jewish nation's obedience or disobedience to its divinely given law, on which depends its prosperity or its adversity. In Proverbs there is a notable absence of this point of view. The name Israel and the terms temple, prophet, priest, covenant, do not occur in the book. The "vision" (that is, prophetic vision) in the book is xxvii. 16; "Where there is no vision the people throw off restraint" is an error of tense. No writer who was acquainted with Hebrew history could suppose that there was any relation between the national morality and the abundance of prophetic visions; the period in which such visions were most numerous is precisely that in which the corruption of morals is painted by the prophets in the darkest colours and, on the other hand, the people are said (in Ps. xlv. and lxiv.) to have been obedient at a time when there was no prophet. Moreover, this reading supplies no antithesis in the couplet, the second line of which is: " But he who obeys instruction (or law), happy is he;" we should expect the first line to read: " Where there is no guidance people throw off restraint," as in xii. 14: Where there is no guidance, a people falls, but in the multitude of counsellors there is safety. Prophets play so great a part in the early history that the ignoring of them here is significant. The deca-
dence of prophecy is indicated in two passages that belong probably to the Greek period: in Zech. xiii. 2 sqq. prophecy is identified with the "unclean spirit," the pretender to visions is threatened with death by his parents, and, so great is the general contempt for the class, protests that he is no prophet but a tiller of the ground, accounting for the wounds on his person (such as these charlatans used to inflict on themselves) by declaring that they were received in the house of his friends (that is, apparently, in a drunken quarrel); from a very different point of view Joel ii. 28 sqq. (Heb. iii. 1 seq.) predicts that in the latter times (in the ideal restoration of the people) all persons, free and bond, male and female, shall have the spirit of prophecy—that is, the old order shall be set aside and a new religious constitution established. Proverbs belongs to the time when prophecy, as a helpful institution, had disappeared, and wisdom literature, as the medium of instruction, may have supplanted it.

It is no longer the law of Moses or that of the prophetic revelation—it is the standard of rightdoing resident in every man's mind, the creation of wise reflection; such a con-
ception lies outside the point of view that forms the very sub-
stance of Hebrew thought in the period prior to the 5th century. It is true that the nationalistic tinge is found in later writings (Chronicles, Psalms), and that its absence, therefore, is not merely a matter of date; but it is hardly conceivable that an author of any time before the 5th century could have ignored the nationalistic point of view so completely as Proverbs does.

Another noteworthy feature of the book is the picture it gives of social life. The organization of the family is treated much more fully than in the Law and the Prophets, and has a more moral aspect. Proverbs is one of the chief sources of Biblical authority, and it is only by the authority of the Bible, even the 7th century, that disobedient son, complained of by his parents, is to be stoned to death by the men of the city; in Proverbs (xiii. 24, xxii. 15, xxi. 13 seq., xxiv. 15, 17) a bad child is to be chastised, and much is said of the training of children by instruction. The impression made by a number of passages (i. 8, xxii. 22 al.) is that a regular system of family education existed, more definitely ethical than that indicated in Deut. vi. 7, which merely enjoins teaching children the details of the national law. In addition to this parental instruction we find hints of a sort of academic training, particularly in chs. i.-ix., in which the sage appears to address a circle of youths. If we may credit the Talmudic tract Pitke Aboth (ch. 1), Jewish academies under the charge of great teachers existed early in the 2nd century B.C., and the wisdom literature may have been connected with them. What is more, the principles laid down in Proverbs would probably be suggested by the Greek schools of philosophy, which early sprang up in Western Asia and Egypt under Alexander's successors.

Monogamy, as is remarked above, is assumed in Proverbs to be the recognized custom. Polygamy was legal and usual in the 7th century (Deut. xxi. 15) and the 6th (Deut. xviii. 17, 18), and doubtless continued to be practised some time after by the Jews, though on this point we have no definite information; Herod, who was a despot, and was not a Jew, cannot be taken as an illustration of Jewish custom; the obscure passage, Mal. ii. 10 sqq. (430-400 B.c.) may have monogamy in mind, but its position on this point is not clear. What is certain is that the practice has been in abeyance since the 7th century, and may be considered as an influence of the Greek literature of the New Testament; Eusebius (xx. 24, 7) that the Jews did not allow polygamy, and the books as Ben-Sira (Ecclesiasticus), Tobit and Judith. In regard to punishment for the violation of a husband's rights Proverbs shows a marked advance on the old usage. The Pentateuchal law (Deut. xx. 10) prescribes death as the punishment for adultery; Proverbs (v., vi. 27 sqq., vii.) treats the offence as a sin against the offender himself, an act of suicidal folly, the punish-
ment coming sometimes from the jealous husband, but chiefly in the way of the physical deprivation and social ignominy that befall the adulterer. This change of punishment imports not a falling off in the moral standard but rather the conviction that a crime of this sort is best dealt with by public opinion; in any case it means a change in the constitution of society.

The experiences described in Proverbs belong especially to city life. Something is said here and there bearing on agricultural pursuits, and there is a paragraph (xxvi. 23 sqq.)—a little treatise it may be called—enjoying on the landowner the
acquiescy in paying special attention to his cattle, large and small; these, says the writer, are the real sources of wealth to the rural landowner. Possibly he means to insist on the advantages of country life over life in the city; if this be so, the paragraph bears witness to the prominence of the latter. Whether or not this is his design, advice to cattle-owners is natural in a manual of conduct. The Jews were mainly country-folk from the time of their settlement in Canaan to their final expulsion from the land by Titus and Hadrian, and the soil of Israelitish Palestine was better adapted to the raising of sheep and oxen than to the production of grain. Doubtless much attention was paid to this industry, but the composition of a little book on the subject, indicating a scientific interest in boviculture, points to a comparatively late period; the Greek and Roman works of this sort, by Aristotle, Theophrastus, Virgil and others, were late. This little treatise stands almost alone in Proverbs; the great mass of its aphorisms relate to vices and faults which, though possible in any tolerably well-organized community, were specially prominent in the cities in which the Jews dwelt after the conquests of Alexander. They are malicious gossip, greed of money, giving security, nocturnal robbery, murder, unchastity. Much space is given to the last-named vice throughout the book, and especially in chs. i. and ix.—obviously it is regarded as a notorious social evil. Comparatively little is said of it in the Pentateuch and the prophetic and historical books. That there were harlots and adulteresses in Israel from an early time is shown by such passages as Judg. xii. 17 (Jephthah’s mother), 1 Kings iii. 16 (the judgment of Solomon), Hos. iii. 1. (Hosea’s wife), by the denunciations of the crime and the laws against it, and by the employment of the terms harlotry and adultery as designations of religious unfaithfulness. Yet, apart from the references to culitic prostitution (which was adopted by the Israelites from the Canaanites), the mention of the vice in questions is not frequent; in a polygamous society and in a country without great cities it was not likely to grow to great proportions. The case was different when the Jews were dispersed through the new Greek kingdoms, and lived in cities like Jerusalem and Alexandria, centres of wealth and luxury, inhabited by mixed populations; this form of debauchery then became commoner and better organized. Hetaireia flocked to the cities. Naukratis in the Egyptian Delta was famous under the Ptolemies for its brilliant venal women. The temptations of Alexandria and the loose morals of the time (latter part of the 3rd century) are illustrated by the story told by Josephus (Ant. xii. 4, 6) of Joseph the son of Tobias. The picture of society given in Ben-Sira (ix. 3-9, xix. 2, xxii. 16-26, xxvi. 8-12, xiii. 9-14), based on life in Jerusalem and Alexandria in the 2nd and 3rd centuries B.C. agrees in substance with the descriptions of the Book of Proverbs. The tone of these descriptions throughout the book, but particularly in chs. i.-ix., is modern. A point of interest is that the exhortations to chastity are addressed to men only; the man is regarded as the victim, the woman as the temptress—women are never warned against men or against the general seductions of society. This silence may be due in part to a current opinion that women were more hedged in by special arrangements and less exposed to temptation than men; but it is chiefly the result of the fact that the Old Testament (like most ancient and modern works on practical ethics) addresses itself almost exclusively to men (certain classes of women are denounced in Amos iv. 1-3; Isa. iii. 16-iv. 1; Ezek. xiii. 17-23); the moral independence of women is not distinctly recognized. In this regard Ecclesiasticus agrees with Proverbs—it has no word of advice for women. The temptress in Proverbs appears to be a married woman; she is certainly such in chs. vi. and vii., and probably also throughout the book. The term "strange woman" (li. 16 al.) means not a foreigner, but one who is alien to the man’s family circle, the wife of another man. Such women may sometimes have been foreigncrns, but the sage’s concern is with the man’s violation of the marriage obligation, be the woman Jew or Gentile. In the earlier time marriages between Jewish men and Canaanite women seem to have been not uncommon; whether (outside of Herod’s family) there were marriages with foreigners in the Greek period we have no means of determining.

Proverbs is remarkable for the attention it gives to kings. The prophets have nothing to say of them as a class. One passage in the Pentateuch (Deut. xvii. 15-20) prescribes that the Israelite king shall be the opposite of Solomon—he shall not accumulate horses, wives, silver and gold, and shall study the law. In the Psalter he is considered merely as a servant of Yahweh. Proverbs treats the king in a quite modern way, as a member of society. He is described ideally as ruling by the might of wisdom (viii. 15, 16), and as controlled in his administration by truth, kindness and justice (xx. 8, 26, 28)—the wicked ruler who oppresses the poor is condemned as not reaching the ideal standard (xxviii. 3, 5, 16). Three manuals of conduct are devoted to him (xvi. 10-15, xxv. 2-7, xxxi. 2-9). His power is recognized—he is the source of life and death (xvi. 14, 15)—but he is treated as a human being who must be governed by the ordinary laws of right. It is especially illustrative of the times that instruction in table manners is offered to the guests of kings—they must be modest in their bearing, not putting themselves forward (xxvi. 6, 7; cf. Luke xiv. 8, 11), and they must control their appetites (xxxii. 1, 2). The reference here must be to the numerous non-Jewish kings of the Greek period, and perhaps also to the Maccabean princes; the manners of the time are set forth in Josephus’s account of Ptolemy’s dinner, at which the Jew Hyrcanus was a guest (Ant. xii. 4, 9). The mingling of despotism and good-natured familiarity there described (and the spirit is doubtless correctly given by Josephus, whether or not his details are historical) agrees with the picture in Proverbs.

Finally, a late date for Proverbs is indicated by what may be called its philosophical element—a feature that it has in common with the other Wisdom books (see Wisdom Literature). This element is recognizable throughout the book, but is most distinct in chs. i.-ix., in which wisdom is personified as the power regulating the affairs of human life (iii. 13-18, viii. 1-21). The portraiture approaches hypostatization in the cosmogenic odes (xvii. 22-31), especially if the first line of v. 30 be rendered: "I was at his side as a master-workman", but the Hebrew word (ʾamon) rendered "master-workman" is of doubtful meaning, and the connexion rather calls for some such sense as "nursing, ward". Yahweh himself is represented as the architect, and wisdom, the first of his works, is his companion, sporting in his presence like a beloved child. The whole passage (xx. 22-31) was early employed by Christian theologians (Irenaeus, Athanasius, Augustine and others) in the controversies respecting the nature of the Second Person of the Trinity, particularly in connexion with the idea of eternal generation; the argument turned in part on the question whether the verb in v. 22 was to be translated by "created" or by "possessed." Ecclesiasticus xxiv. and Wisdom of Solomon vii. should be compared with the Proverbs ode. In the remainder of the book (chs. x.-xxiii.) "wisdom" is sometimes common sense or sagacity, sometimes the reflective habit of mind and largeness of outlook, sometimes the recognition of the ideal standard of living. Contrascted with the wise are fools, and on these the sages vent their scorn abundantly (xii. 15, 16, xvii. 12, xviii. 6, 7, xiii. 9 al.); xxvi. 1, 3-12 is a "book of fools." The conception of the good life is that philosophically ordered rule. The religious element is prominent in x. 1-xxi. 16, but it is blended with the reflective. The philosophy of the book is practical, not speculative.

Comparison of Proverbs with Ecclesiasticus, Ecclesiastes and Wisdom of Solomon shows that it belongs, in its main features, in the same category as these. Its thought, differing so widely from that of the prophets and the Pentateuch, is most naturally referred to the period when the Jews came into intimate intellectual contact with the non-Semitic world, and particularly with the Greeks (philosophical influence is not to be looked for from Persia).

While the general period in which the book belongs may thus be determined with fair probability, it is less easy to fix the dates of its several parts. The earliest of the groups of which the book
is composed seems to be i. 1–xxii. 16, xxv.–xxix. which consists of simple aphorisms relating to everyday affairs. This group, however, is itself composite; we may distinguish a collection of antithetic couplests (x–xv. and most of xxi, xxix.) and one made up of comparisons and single sentences (xvi. 1–xxii. 16, xxv.–xxvii., and some verses in xvi, xxix.). Of these two the first, on account of its simpler form, appears to be the earlier; though they cannot stand far apart in time; and by combining them an editor formed the section as we now have it. These may have been severally made from current collections, a number of which were probably in existence. A general preface exhorting the pupil to give heed to the instruction of the sages (xxii. 17–21), introduces a group of quatrains in two sub-groups (xxii. 22–xxiv. 22 and xxiv. 23–34) characterized by a wide range of thought and by ethical depth. Probably later than these are the elaborate discourses of i–ix; (excluding vii. 7–5, 6–11, 12–19 and ix. 7–12; misapplied paragraphs) containing praise of ideal wisdom and warnings against unchastity. Chs. xxx., xxxi., made up of various pieces, form a sort of appendix to the book; some of the pieces are artificial in form (xxx. 11–31). One is a full picture of a good housewife’s life (xxx. 10–31); two are ascribed to the unknown persons Agur (xxx. 2–4) and King Lemuel’s mother (xxx. 2–9). Agur’s dictum is one of pious agnosticism directed, apparently, against certain theologians who talked as if they were well acquainted with the ways of God. Agur’s word, breathing the spirit of scepticism, falls into the category represented by Ecclesiastes, and we may probably set the year 200 (or possibly 150) B.C. as the lower limit of the Book of Proverbs; allowing for a century or two of the collection and combination of the various parts, we shall have the year 300 B.C. as the date of its earliest section. Some of the material may have existed in aphoristic form before, but the composition of the present book may be put approximately in the century 300–200 B.C. Even its simplest maxims have a certain academic form.

In its general ethical code Proverbs represents the best standard of the times; the sages are at one with the more enlightened moralists of the Western world. All the ordinary social virtues such as truthfulness, honesty, kindness, chastity are emphasized and a great stress is laid on care for the poor (a social necessity at a time when there were no well organized public charities). But Proverbs seems not to go the length of identifying righteousness with almsgiving, as is done in Dan. iv. 27 (24), Matt. v. 1, and substantially in Ecclus. iii. 30, xxix. 12 and Tobit iv. 10, xii. 9; in x. 2, righteousness derives from death, the word “righteousness” is probably to be taken in its ordinary ethical sense. The above-named virtues are all recognized in the earlier but not the later parts of the writings, the prophets and the law, but in certain points Proverbs goes beyond these, notably in its prohibition of extermination over a fallen enemy (xxiv. 17) and of retaliation for injury received (xxiv. 29), and in its inculcation of kindness to enemies (xxv. 21). The injunction in Lev. xix. 18, “Thou shalt love thy neighbour as thyself,” refers only to Israelite fellow-citizens, not to enemies (cf. the interpretation given in Matt. v. 43), and the command in Exod. xxiii. 4 seq., to care for one’s enemy’s ox or ass likewise refers to Israelites; Proverbs conceives the principle in a higher way and extends it beyond the limits of the nation. Slavery is recognized as a lawful institution, but little is said of it. There is no suggestion of moral training of the slave; he is to be taught not by words (xxxv. 19) but by the rod, like the child (v. 15), and it is intimated (v. 21) that it is a mistake to bring up a servant delicately. This is the general view of the time. Ben-Sira frankly regards the servant as a chattel (Ecclus. xxxii. 24–31). Proverbs greatly disapproves of the elevation of slaves to the position of rulers (xix. 10)—an occurrence not uncommon in those days. The estimate of woman as wife and mother, and especially as housewife, is high (xviii. 22, xix. 14, xxxi. 10–31). In vi. 20 the mother is spoken of, along with the father, as teacher of the children, and it is assumed, therefore, that she is competent; but nothing is said of the education of women— in xxxi. 26 the “wisdom” of the good wife (not “virtuous woman”) is good sense, practical sagacity in housekeeping. The equality of all men as creatures of God, silently assumed in the earlier literature, is definitely expressed in Proverbs (xxii. 2, cf. Job xxxiv. 19, Ecclus. xi. 14). Humility, as the opposite of insolent pride, is recognized as a virtue (xvii. 12, cf. xvi. 18)—it is a modest estimate of one’s worth, refusal to claim too great honour for one’s self. In general it is the simple homely virtues that are enjoined on men in Proverbs—there is no mention of courage, fortitude, intellectual truthfulness, and no recognition of beauty as an element of life; the ethical type is Semitic, not Hellenic, and the sages emphasize only those qualities that seemed to them to be most effective in the struggle of life; their insistence on the practical, not the heroic, side of character is perhaps in part the consequence of the position of the Jewish people at that time, as also the silence respecting international ethics belongs to the thought of the times. The great of the moral judgments in the book, however, is not the view of God and internal (the conscience of man); these two are fused into one, and both go back ultimately to current customs and ideas. The motive assigned for right doing is individualistic utilitarian—the advantage accruing to the man through the laws of society or through the rewards dispensed by God. This motive, which is the one assumed throughout the Old Testament, is effective for the mass of men, and becomes ethically high when the advantage had in view is of an elevated moral character. Proverbs does not offer the good of society as an aim of action, though it takes for granted that good conduct will promote the happiness of all. Assuming human freedom it at the same time assumes that the life of man may be overthrown by a wise employment of man’s resources, and it silently regards universal happiness on earth as the goal of human development. Its religious scheme is the simplest form of them; religion is reverence for God and obedience to His laws. Though the sages doubtless recognized the temple-cult as of divine institution and obligatory, they lay no stress upon it; for them the essence of religion is something else; right living, they say (xxi. 3), is more acceptable to God than sacrifice, and sacrifice without ethical feeling is abominable to Him (xxv. 8). Subordinate supernatural beings (angels and demons), though of course accepted as real, are ignored as having no importance for life. There is no reference or allusion to national Messianic hopes (certainly none in xvi. 10–15); neither the political situation in the 3rd century B.C., nor the sages’ point of view was friendly to such hopes. The view of the future life is the old Hebrew one: death is practically the end-all, Sheol is the negation of happy activity, and from it no one returns; in v. 23, vii. 27, ix. 18, x. 2, the reference is to premature death on earth. The aim of the sages is to make earthly life strong and happy. They lay no claim to divine inspiration—they speak simply as ordinary human thinkers, though they are convinced that they have eternal truth.

The reception of Proverbs into the Hebrew Canon was for a time opposed on the ground of a supposed contradiction between two aphorisms (xxvi. 4, 5) and (vii. 7, 20) of too highly coloured descriptions (Shabhath, 30b, Aboth Nathan, cap. i.); these difficulties were got over, and the book was finally declared canonical. It is quoted over twenty times in the New Testament, and has always been highly valued as a manual of conduct.

Of the ancient versions the Septuagint is the only one that is of great service for the criticism of the Hebrew text of Proverbs. The Latin, the Peshitta Syriac and the Targum occasionally offer suggestions; the Hexaplar Syriac and the Septuagint are of value for the determination of the text of the Septuagint.

BIBLIOGRAPHY.—The Hebrew text is discussed in all recent commentaries; see also Dyrserinck, in Theol. Tidschrift (1885); Conder and Kamar, in Zeitschr. f. die alt. Geschichte (1888); Chajes, Proverbs-Studies (1889); Muller and Kautzsch, in Haupt’s Sacred Books of the Old Testament (1901). The Greek versions are treated by de Lagarde, Anmerkungen (1863); Baugartner, Enzyklop. Wissenschaft (1890). For the Syriac see Piskins in Zeitschr. f. die alt. Geschichte (1894). Compare also Nestle’s article “Bibellübersetzungen” in the third edition.
of Herzog-Hauck's Realeencyklopädie. Among commentators and translators may be mentioned: Ewald (1837, 1867); Noyes (1836); Stuart (1852); Hitzig (1858); Zöckler, in Lange's Bibelwerk (1866, Eng. trans., 1870); Deltzsch (1873, Eng. trans., 1875); Reuss, in Leben der Propheten (1879), etc.; Thiersch, in Kursusgeset. Exeg. Handbuch a. Z. A. (1883); Strack in Strack u. Zöckler's kursuf. Comm. a. Z. A. (1888, 2d ed., 1899); Horton, in Expositor's Bible (1891); Wildebode, in Marti's Kurz. Handbuch d. A. (1896); and Naukowicz, in Nowack's Handbomm. a. Z. A. (1898); Toy, in Internat. crit. Comm. (1898); Kautzsch, Die heil. Schrift. d. A.T. (2d ed., 1866); Oort, Het Oude Testament (1898–1900). Life (1898); Montefiore in Jew. Quart. Review (1889–1890). On Proverbs of Other Peoples: Egyptian—Griffith, art. "Egypt Lit." in Liber. of World's Best Lit. (1897), vol. xiii; Nieser, in Litt. of Egypt (1897); id.; Jei. Lit. of Egypt (1897); Beitr. zur Geschichte des Orients (1892); Hindu: Monier-Williams, Indian Wisdom (1875); Arabic: Jacob, Allarab. Parallele zu. A. T. (1897); Fleischer's ed. of Ali (1857); Freytag, Arabum proverbia (1858). A general collection has been made by Malam, Orig. Notes on the Book of Proverbs (1893).

PROVIDENCE, the second largest city of New England, capital of Rhode Island, U.S.A., the county-seat of Providence county, and a port of entry, situated at the head of Providence river (the N. arm of Narragansett Bay) and at the influx of the Seekonk (or Blackstone), Moshassuck and Woonasquatucket rivers, about 35 m. from the Atlantic ocean, 45 m. by rail S.S.W. of Boston, and 185 m. E.E. of New York. Pop. (1890), 132,146; (1900), 175,597; (1905, state census), 198,635, of whom 65,746 were foreign-born, including 17,155 Irish, 12,114 Italians, 9795 Jews, 4221 English Canadians, 4005 French Canadians, 368 Russians, 3347 Swedes, 2211 Germans, 2173 Portuguese (including some Bravas from the Cape Verde Islands), and 1930 Scotchmen. The figure for 1910 was 224,336. Providence is served by the New York, New Haven & Hartford railway and by steamboat lines to Newport, New York, Philadelphia, Baltimore and Norfolk. It extends over an area of more than 18 sq. m., and is irregularly laid out. The Seekonk and Providence rivers mark the boundary. The Providence and Moshassuck rivers divide the middle and northern portion of the city into the east and west sides, and the Woonasquatucket river divides the west side into the northern and southern parts. The west side is a level or gently rolling plain only a few feet above the sea, but on the eastern side are a plateau and hills rising to a maximum height of about 200 ft. The larger and newer portion of the business district is along the western bank of the Providence, and some of the best business houses are on made land. The part of the city which has most historic interest is on the east side, where are the most attractive residences. Most of the manufactories are along the banks of the Woonasquatucket and Moshassuck. The names of streets—Pound, Sovereign, Shilling, Dollar, Doubloon, Benevolent, Benefit, Hope, Friendship, Peace, &c., reflect the early commercial importance of the city and its strong Quaker element.

The principal building is the large State House, completed in 1902, of Georgia marble and white granite, surmounted by a central dome of marble, 235 ft. high, and standing on a rise of ground (Capitol Hill) about ¾ m. north by west of the steamboat landing at the head of Providence river; in the state chamber is a full-length portrait of George Washington by Gilbert Stuart. The old State House on Benefit Street, on the east side, is now used as the 6th district (Providence and North Providence) court-house. Near the centre of the city (in Exchange Place) is the city-hall (1878), a handsome structure of granite; on its façade is a medallion of Roger Williams. Across Exchange Place from the city-hall is the Federal Building (1908), which houses the post-office, custom-house, U.S. courts, &c. The county court-house (1877) is the only other prominent government building. The Arcade (1828), 225 ft. long, with six massive Ionic columns at each entrance, the Butler Exchange, and a few other fine buildings fronting on Westminster Street are among the more prominent business buildings. In Cranston Street, between Waterio and Dexter, is an armory, with the largest hall in New England. A handsome public library building, opened in 1900, lying between Fountain, Greene and Washington Streets, houses a good collection of 140,000 vols. (in 1900); other libraries are the State Library (30,000 volumes), the State Law Library (50,000 volumes) in the Providence county courthouse, the Providence Athenaeum (the Providence Library, established in 1753, united in 1836 with the Providence Athenaeum, established in 1831; in 1909 it had 73,000 volumes), the library of the Rhode Island Historical Society (established 1822; with 30,000 volumes and 50,000 pamphlets in 1900), and the libraries of Brown University. The meeting-house of the First Baptist Church, founded by Roger Williams, the oldest organization of this sect in the United States, was built in 1775 and was designed to resemble St Martin's-in-the-Fields, London. Its bell still rings the curfew at nine o'clock every evening; and the commencements of Brown University are held here. The Friends' meeting-house, another interesting old building, was erected in 1759. The Beneficient Church (Congregational, 1809–1810) is in the Colonial style, with a rounded dome. The Church of the Blessed Sacrament (Roman Catholic), in Academy Street, was designed by John C. Farnaz. The Roman Catholic Cathedral of SS. Peter and Paul (1878) is of brown stone and has excellent interior decorations. Providence is the see of a Protestant Episcopal bishop. In Cathedral Square is a statue (1899) by Henry Hudson Kitson of Thomas A. Doyle, mayor of the city (1864–1869, 1870–1881, and from 1884 until his death in 1886). There is an equestrian statue (1887) by Launt Thompson of General A. E. Burnside in City Hall Park. In front of the post-office are two allegorical groups ("Providence" and "the United States") by J. Massey Rhind. In Columbus Park is a replica of Bartholdi's "Columbus," which was cast in silver by Providence metal workers for the Columbian Exposition in Chicago. Other statues are Hippolyte Hubert's Ebenezer Knight Dexter (erected 1804), George Thomas Brewster's bronze "Ginns of Religious Liberty" on the dome of the State House, Franklin Simmons's Roger Williams (1877) in Roger Williams Park, a Helene Bouchot's "Piscator" (1905), in Roger Williams Park, and a Hellenic statue of Augustus on the campus of Brown University. Two fountains also are worth mention: the Bajonotti Memorial Fountain in City Hall Park, a memorial to the wife of Paul Bajonotti, representing "The Struggle of Life" and designed by Enid Yandell; and the Elisha Dyer Memorial Fountain, a bronze athlete, by H. H. Kitson. There are art collections in Brown University and in the Annmary Brown Memorial (given to the city as a memorial to his wife, a daughter of Nicholas Brown, by Rush C. Hawkins, b. 1831). Among interesting old houses of the 18th century are the Admiral Hopkins House, in Hopkins Park, the Stephen Hopkins House (1742; 9 Hopkins St.), the John Carter Brown House (1791; 35 Benefit St.), and the John Brown House (1786; 52 Power St.). There are many colonial houses, red brick with marble trimmings, set well back from the street, with an occasional walled garden. There are many parks. The Ram in Providence, including the Chopin Club (1780), the Arzon Club (1880), the Einklang Singing Society (1890; German), the Verandhi Swedish Singing Society (1894), and the Providence Musical Association (1904). Other clubs are the Brown Union, University Club, a cricket and a polo club, golf clubs, yacht clubs and canoe clubs, the Handicraft Club, the Providence Art Club, the Hope Club and the Deutsche Gesellschaft.
